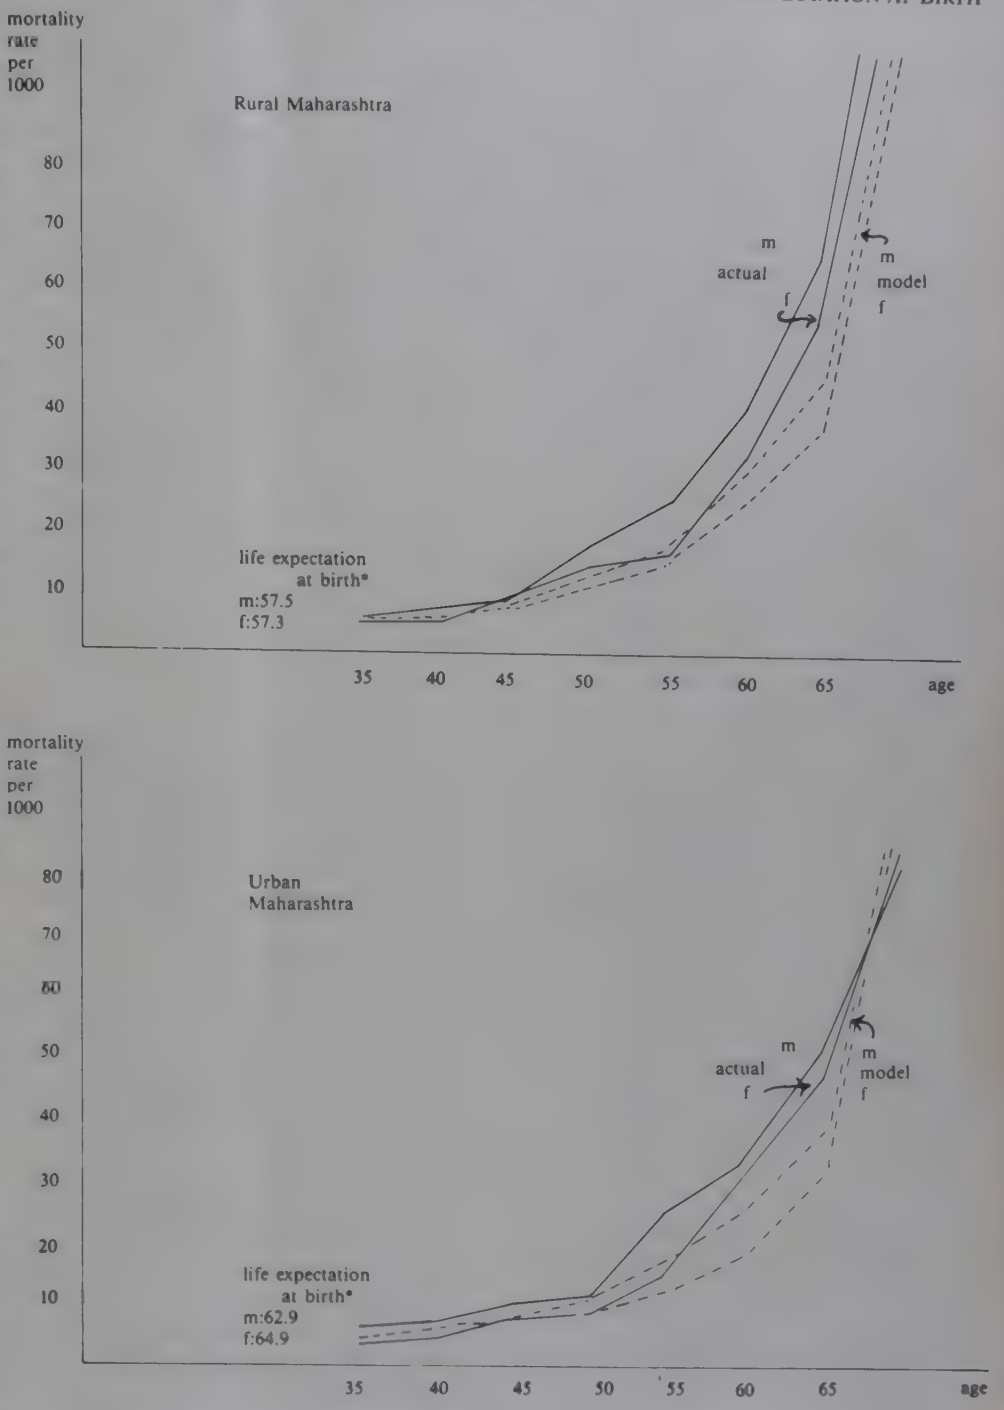
As we noted above, dominating the deaths due to respiratory diseases is tuberculosis as the single most important and growing cause of death. Since some of the ward boundaries have changed between 1971 and 1981 it would be difficult to specify with accuracy the proportional change in the cause-specific death rates by ward; but looking at those wards where boundaries have remained the same, it would seem that TB deaths have only grown and not declined during the 1970-80 decade—and in some cases the rates themselves have increased also.[25] TB deaths in Greater Bombay exhibit some striking spatial characteristics. The island city's mortality is twice as high as that of the suburbs and almost three times that of the extended suburbs: crude rates of 130, 73 and 54 per 100,000 respectively in 1980-81 (Table 4). Mortality is highest in five wards: A, B, C, E and F-South. If these rates were standardised by age and sex our profile by ward would need some modification. But neither age nor sex composition differentials between wards are sufficient to account for such large differentials in TB mortality rates, nor for a ratio of nearly 3:1 between the city and the extended suburbs.

Figur 2: Comparison between Age-Specific Adult Mortality in Maharashtra and a Western European Model at same Level of Life Expectation at Birth›



* estimated from mortality in age group 5-34

*Source:* Office of the Registrar General, *Sample Registration System 1970-75*, New Delhi, 1982, calculations based on average for years 1973-75. A Coale and P Demeny, *Regional Model Life Tables and Stable Populations*, Princeton, 1966, calculations based on "West" model.

Since respiratory tuberculosis is closely associated with poverty, i e, low levels of nutrition and over-crowding, the concentration of population around the concentration of industries, mainly mills, in the island city, and around the docks (on the eastern seaboard), would seem to suggest some of the principal reasons for this spatial pattern of mortality. The male-dominated occupational structure and the tradition of male dormitories particularly of textile workers in the island city chawls explains some of the male preponderance in the number of TB deaths in the city. There is evidence that the sex ratio (females to males) is by and large lower in all the island city wards; for instance E ward is lowest with 682 females per 1,000 males (1981 Census) and C ward next with 693 females per thousand males (D ward has the highest ratio—811). Contributing to higher male death *rates* may be alcohol consumption, which makes for progressive malnutrition through lowered food intake. The over-crowding in chawls is an acute manifestation of the high population density in the island city, three to four times higher than in the suburbs and extended suburbs, facilitating the transmission of the disease and hence increasing its incidence rate.

The high TB mortality recorded in the island city raises a question of data interpretation. Does the concentration of the large municipal hospitals and the TB group of hospitals in the island city make for an unduly high concentration of TB deaths? We suggest this is unlikely, though some bias may be introduced in this way. The current TB registration system is comprehensively organised and place of residence is recorded. In fact the ward that contains the main TB hospital (in Sewri) does not exhibit the highest rate of TB. And further, other respiratory diseases do not show any concentration in the hospital areas.

Another important categoty of respiratory diseases contributing to mortality is the group bronchitis, asthma and emphysema.[26] Closely associated with both the macro-environment (air pollution) and the micro-environment (nature of shelter and exposure to infection), it exhibits higher mortality in the island city than in the suburbs and extended suburbs, although the order of magnitude and the spatial differential are not nearly so great as for TB (Table 4). Surprisingly, in the mortality

from these chest diseases, ward M in the suburbs which has received notorious publicity as the most polluted area in Greater Bombay due to the concentration of industry in Chembur-Trombay does not figure prominently. This is probably due to the relatively healthier air condition at nights, when the easterly winds carry the polluted air into the city thus making parts of the island city more polluted overall.[27]

We have discussed earlier the possible inter-relationships between chest and cardio-vascular diseases particularly due to the exacerbating influence of acute air pollution. For the poor there are additional factors which may contribute to this inter-relationship: strain on the chest and lungs due to manual labour, consumption of poor quality alcohol and unprocessed tobacco, malnutrition and attendant anaemia. It is interesting to note that ischaemic heart disease mortality is high in the island city, in fact next only to TB, with suburban and extended suburban mortality due to this cause reflecting a differential similar to that in TB (Table 4). The four city wards exhibiting the highest mortality are A, B, C, D and only the relatively affluent western suburb of H-West has a comparable rate.

The mortality statistics for avitaminoses, other nutritional deficiencies and anaemias also figure highly in three island city wards: E, F-South and G-North, although M ward in the suburbs appears to be worst off in this regard, followed by K-East. These diseases, if correctly diagnosed, are a clear indication of poverty.

We have intimated that poor environmental conditions and poverty are concentrated in large pockets of the island city, just as much as in the suburbs: this is despite the fact that only 17 per cent of the island city's population lives in 'slums' (1976 data),[28] i e, hutment colonies, compared with 53 per cent and 68 per cent in the suburbs and extended suburbs respectively. The infant mortality rates for Bombay bring this out vividly. Despite an overall decline since 1970-71 the infant mortality rate was still high in 1980-81: 69, 64, 53 deaths per 1,000 live-births in the island city, the suburbs and the extended suburbs respectively (Table 4). The highest figure is to be found in the island city's C, E, F-North and G-South wards and in M ward in the suburbs. The rates for the suburbs and extended suburbs (excluding M ward) are uniformly lower than the island city rates.

The commonly observed causes of infant mortality are the nutritional status of the mother and the complications of childbirth, with micro-environmental conditions—sanitation, availability of water, quality of shelter and overcrowding—exacerbating unfavourable health-status conditions. Looking at the *intra*-ward differences might illustrate this even further. In the case of C ward within which we are able to observe such differences, subdivision C-i, marked by its preponderance of trading activity and by its dilapidated buildings with inadequate sanitary facilities, has an infant mortality rate of 112.6 as against subdivision C-iii with an IMR of 65.1. This difference can be seen across all those diseases where the micro-environment particularly is a determining factor: 184 per 100,000 TB deaths in C-i as against 95 per 100,000 TB deaths in C-iii; and 174 per 100,000 deaths due to ischaemic heart disease in C-i as against 129 in C-iii. For bronchitis, however, there is virtually no difference: 33 and 34 per 100,000 respectively, suggesting that the macro-environment, for example air pollution, may be a more important determinant of the level of this disease.

It is the diarrhoeal diseases that have registered a definite decline, although not uniformly throughout Bombay. There remains here (in 1981) a suburban concentration with wards K-West, L, M, N and T still showing the highest mortality rates. These were also the wards with high concentrations of slum colonies (1976 survey) many of which are still poorly serviced with water or sewerage.

The following broad hypothesis might be advanced. Air pollution in the island city contributes towards the higher incidence of respiratory mortality therein. In the case of TB in particular other factors such as malnutrition and overcrowding severely exacerbate these conditions. In the suburbs poor sanitary conditions contribute toward the higher levels of the diarrhoeal diseases, with malnutrition playing an attendant role. Finally we note that the preponderance of particular causes of mortality in specific areas of Bombay will be partly due to differential age and sex structure, but we hypothesise that this factor is only one among those contributing to the patterns we observe.

In summary, it is time for those who

have it in their power to improve the health of the poor, be they activists from among the poor themselves or their allies from elsewhere in urban society, to focus their attention equally on those diseases that afflict the lungs and chest; to turn their minds towards the aggravating factors that are believed to be rapidly deteriorating in urban areas, and especially in industrialising areas; not to abandon the fight to combat water pollution, but not to neglect the fight to combat air pollution that has taken the lives of countless city dwellers in all industrial nations, sometimes in epidemic proportions, in quite recent times. In crises such as these the rich might take note that they too do not escape so easily, for air is the most public of all assets, and once it is contaminated no one is excluded from its potentially devastating effects. At the same time it would be wrong to suppose that if the environment were cleansed, respiratory sickness, and particularly TB, would disappear. So long as overcrowding, poor shelter, and malnutrition remain, these disease will flourish and take lives from among the city's deprived.

It is time also to investigate more carefully the range of morbidity conditions that co-exist in such a wealthy city as Bombay, to get beyond the averages and to learn the worst, so that eradication can start where the need is most. This fairly large research task is currently being attempted by the authors of this article: herein we have reported on only the first tentative steps.[29]

## Notes

[This paper has benefited enormously from many discussions with colleagues and friends: but the authors are especially grateful to those who commented on an earlier draft: Bhanwar Singh, Lado Ruzicka, Penny Kane, Tim Dyson, Elizabeth Breeze, and Christine Callum. They are all exonerated from the shortcomings and especially from the subjective opinions expressed herein.]

1 The authors note in particular two earlier research papers that have attempted an overview of Bombay's mortality: G Kothari, et al, "Appraisal of Current Conditions of Health in Greater Bombay", International Institute of Population Studies, Bombay, 1983 (mimeographed) and, C A K Yesudian, "Primary Health Care Planning in Big Cities", Tata Institute of Social Sciences, Bombay, n d (?1984), (mimeo). The current authors have undertaken various methods as quality checks on the official data. They are particularly grateful to A M Ravetkar for allowing access to provisional data for Poona and to H N Ranganathan for advice on data quality, which is also analysed by a number of contributors to the *Maharashtra Health Bulletin* (Government of Maharashtra), April-May 1983. However good the data, it is clear that diagnostic and recording practices change over time, and this caveat needs always to be borne in mind.

2 On London see for example, Brian Meredith Davies, "Community Health, Preventive Medicine and Social Services", London, 1979. On Shanghai see, Zhengua Jiang and M Karkal, 'Mortality Decline in China' in K Srinivasan and S Mukherji eds "Dynamics of Population and Family Welfare 1981", Bombay, 1981; and, Shanghai Subcentre of Education and Publicity on Family Planning, "For a Sure Future" n d (?1982), (leaflet); and, R and V Sidel, "Health Care of China", Boston, 1982, NC also benefited from discussion with senior medical staff at the International Peace, Maternity and Child Health Hospital, Shanghai, on a visit in 1982.

3 Personal communication from S R Kamat, KEM Hosptial, Bombay.

4 NC's observation, February 1984.

5 S Lahiri, "Environmental Variation in Relation to the Place of Residence: A Study of a Satellite Town under the New Bombay Scheme", in K Srinivasan and S Mukherji, eds, op cit.

6 P Townsend and N Davidson, "Inequalities in Health" (The Black Report), Middlesex, 1982.

7 M Bapat and N Crook, "The Economics of Health and Health-Care in the Industrialising City of Poona", School of Oriental and African Studies, London, 1981 (mimeo); M Bapat, "Determinants of Health in Low-Income Communities—a Case Study of Poona", Centre for Development Studies and Activities, Poona, 1982.

8 The average has fallen marginally from 5.4 persons per dwelling to 5.2 (from 1961 to 1981) in Greater Bombay; in Poona (Municipal Corporation) it has risen from 5.2 to 5.5 (Census, 1961 and 1981).

9 In Bombay the population residing in slum colonies (hutments) was estimated at 2,850,000 (38 per cent of the total population) in a Census held in 1976, but by 1981 was estimated to have reached 3,800,000 (45 per cent of the total), as reported in, Municipal Corporation of Greater Bombay, "Redevelopment of Slums through Participation of Slum Dwellers", Bombay, n d (?1984).

10 See, *inter alia*, D Morley, "Paediatric Priorities in the Developing World", London, 1973.

11 For analysis of damage done by bituminous coals see, A C Stern, "Air Pollution", Vol II, Chapter 7, New York, 1977.

12 Uniquely in the case of Poona the records are available separately for residents and non-residents: it can be seen that a substantial proportion of non-residents have their deaths registered in the city (Table 1). In the data presented here we have been able to maintain the distinction for the 1970-1980 decadal trends but not for the age-specific estimates. For Bombay, where distinguishing records are not available it is always possible there is some excess mortality due to hospitalisation of rural cases in the city.

13 N R Crook, "The Changing Character of Mortality in the City of Poona", School of Oriental and African Studies, London, 1982.

14 On Poona see note 7 above. On Bombay see A R Desai and S D Pillai, "Slums and Urban Development", Bombay, University of Bombay, 1970, (mimeo), and A R Desai and S D Pillai, "A Profile of an Indian Slum", Bombay, University of Bombay, 1972.

15 See A C Stern, op cit.

16 N Goldman, 'Far Eastern Patterns of Mortality', *Population Studies*, March 1980.

17 Even the All-India data presented by Tim Dyson in his article 'Excess Male Mortality in India', *Economic and Political Weekly*, March 10, 1984, do not show as striking a differential between the sexes as is apparent in the far-eastern cases he illustrates. There is a clear suggestion from his diagram that there is a deterioration in female mortality also at adult ages in comparison with the models he is using.

18 It is interesting to note that the Model Registration Scheme, whose coverage appears to be good in Maharashtra, indicates less of a sex differential in deaths from tuberculosis in rural compared with urban areas. There is a slight risk of some bias here due to the possibility of male cases being more likely to be hospitalised in special TB hospitals which will be situated in urban areas. However, a survey conducted by the Indian Council of Medical Research in 1959 also found that rural rates of TB were as high as urban (ICMR Report No. 34, New Delhi); for later studies see the excellent summary in M P S Menon, "Pulmonary Tuberculosis", New Delhi, 1983. Our own estimate from the MRS data suggests that rural TB mortality rates in Maharashtra lie between those recorded for Poona and for Bombay.

19 Zhengua Jiang and M Karkal, op cit.

20 On the differential access to curative services among different sectors of Indian society see, Radhika Ramasubban, 'The Development of Health Policy in India' in T Dyson and N Crook, eds, "India's Demography: Essays on the Contemporary Population", New Delhi, 1984.

21 Pesonal communication from A P Rao, TB Group of Hospitals, Sewri, Bombay.

22 T Dyson, op cit, note 17 above.

23 Even more striking differentials here were found in the morbidity conditions in the Poona slum survey, op cit, note 7 above.

24 In Bombay itself, however, deaths due to fires have become more frequent among *men* during the 1970s.

25 These have not been standardised by age or sex; this cannot be done from published data at the level of the ward. See Municipal Corporation of Greater Bombay, Annual Report of the Executive Health Officer, relevant years down to 1981. We are grateful to S S Sabnis for his help.

26 We withhold a detailed discussion of pneumonia since this is often a complicating factor in the development of other diseases and hence more difficult to relate directly to social or physical environments.

27 Municipal Corporation of Greater Bombay, "Bombay Air Pollution—Health Study", KEM Hospital Bombay, 1984.

28 Data from 1976 Slum Survey, quoted in Municipal Corporation of Greater Bombay, "Report on the Draft Development Plan (Revised) 1981-2001 for Greater Bombay", Bombay 1984.

29 This project is being undertaken by the authors jointly at the Centre for Social and Technological Change, Bombay. NC also wishes to acknowledge support he has received from the School of Oriental and African Studies, London, and RR is grateful to D Narain of the Department of Sociology, Bombay University, for facilitating her work.

# Superpowers in Collusion

**Narindar Singh**

*Mankind has acquired the dubious ability to destroy itself over and over again only recently and cannot possibl live with it for long. For even if we altogether ignore what are commonly described as 'conventional' weapons and even if we forget all about the biological and chemical arsenals being expanded at present, the explosive power already congealed in the nuclear 'warheads' alone is sufficient to blow up the biosphere of the Earth many times over. What we need to, can and must try to comprehend is the essential logic of this situation.*

*The intensification of the process of weaponisation means that each superpower establishment, using the other's programmes and pursuits as an excuse, extracts ever larger resources out of its own people. But at the same time, the two powers will be, and in fact will have no option but to be, seeking new modes of accommodation with each other. By the very nature of the weapons they have managed to acquire the two have been forced to enter into a state of a fateful and a potentially fatal collusion. Each is concerned with its own build-up as determined by the perceived domestic requirements of its own Establishment. In the circumstances, the contradiction must get crystallised. and also find expression, not between the blocs but within each bloc.*

## I

## Introduction

ALBERT EINSTEIN's secretary during the last twenty-seven years of his life, Helen Dukas, and his close collaborator, Banesh Hoffman, had, not very long ago, a delightful little Einstein tale to tell. According to them, a prominent American publisher, whom they chose not to identify, had just broken ground for a new library wing for his country home and wanted to place in the cornerstone an airtight metal box containing items that would be of considerable archaeological interest to the coming generations. Thus, one of the items intended to be interred in this Time Capsule was to be an issue of *The New York Times* printed especially for this purpose on long-lasting rag paper.

The publisher wanted Einstein also to contribute a message for posterity and to this end sent him a sheet of this very special paper which he said was expected to last for a thousand years.

Einstein responded immediately with the following message:

Dear Posterity,

If you have not become more just, more peaceful, and generally more rational than we are (or were)—why then, the Devil take you.

Having, with all respect, given utterance to this pious wish,

I am (or was)
Your
Albert Einstein[1]

This was written way back in 1936: and over the years, the world has become not 'more just' as Einstein had wished it would, but less and therefore also not more peaceful but less. And, finally, far from being generally more rational, it has become so morbidly irrational as to have brought its own annihilation very much within the range of what Bertrand Russell once called 'feasible lunacy'.

Already in 1936, the situation was bad enough to have provoked Einstein into articulating what he called his 'pious wish'. And yet, the Nazi Holocaust of the Jews was still in the future, and so were the Second World War, the 'First Cold War' and the 'New Cold War'; and each one of these would take its own heavy toll of rationality. In consequence, and in less than fifty years of Einstein having composed the above warning to posterity, our race has moved so far away from rationality and therefore from its much-flaunted sapience that it would do well to redesignate itself as *homo insipiens*. For 'sapience' certainly cannot have 'the potential for self-destruction' as one of its connotations.

Mankind has acquired this dubious ability to destroy itself over and over again only recently and cannot possibly live with it for long; in any case not for long enough in terms of historical time. For even if we altogether ignore what are commonly described as 'conventional' weapons and even if we forget all about the biological and chemical arsenals being expanded at present, the explosive power already congealed in the nuclear 'warheads' or rather mega-death-heads alone is known to be sufficient to blow up the biosphere of the Earth many times over.

Life as such may perhaps manage to continue in the form of some micro-organisms; and a variety of insect species might actually begin to thrive after the Holocaust. But from the point of view of human habitation in any case, the biosphere will have been destroyed absolutely thoroughly. No other conclusion seems possible. For, generally said to be around 20,000 million tons of TNT equivalent, the nuclear component of the explosive power now 'available' to the world is roughly one million and seven hundred thousand times the 'yield' of the Hiroshima bomb.

Such figures can do little but strike the mind with total incomprehensibility. For the human brain is simply not designed to comprehend the kind of disaster which would be caused even by a fraction of this explosive power actually getting used in a future war.

However, what we need to, can and must try to comprehend is something entirely different: the essential logic of the existing situation. But in order to comprehend this logic, we must, in the first place take care to specify the defining features of the prevailing situation: defining in the sense, that they make it altogether unique in the historical experience of our race: both unprecedented in the past and unsustainable in the future. To my mind, these features, mutually reinforcing and interlocking that they are, may still, for the sake of convenience, be identified as follows:

(1) The emergence and consolidation in the world today of two pyramids of power, each so colossal that all other pyramids of power of the past and present fade into insignificance. One of these pyramids professes or pretends allegiance to Liberalism and the other to Marxism. But both of them continue to obey, inexorably and relentlessly nothing but the dictates of Opportunism.

(2) Both of these pyramids of power have available to them vehicles of mass destruction so indiscriminate that each can destroy the other, the rest of the world and itself too, many times over.

It is easy to see that in this macabre situation each of the two superpyramids can expect to endure if and only if it can count at least on the tacit approval of the other, even if it may not expect to be given active co-operation and protective patronage by it. I have proposed elsewhere that each of the two superpowers be taken to be both a gigantic fish and a wily scorpion. Thus understood, each is a fish with respect to its satellite sub-states and at the same time a scorpion with respect to its sister superpower. It is in this way that the two seek and can also hope to be able to manage the rest of the world. It follows that each must in effect condone as a scorpion what the other has to do as a fish.[2]

In a recently completed State of the Art Report, Bjorn Hettne has designated the above formulation as possibly the 'main explanation' of the New Cold War.[3] Indeed, if the superpowers did not take it to be a mere game, they wouldn't dare undertake the kind of intensified weaponisation which is associated with what is called the New Cold War. That the game is extremely expensive and as dangerous only adds to the unmitigable madness of the present situation. Even so, as I will be arguing later, it cannot be described as MAD-ness.

Be that as it may, the intensification of the process of weaponisation only means that each superpower Establishment, using the other's programmes and pursuits as an excuse, will now be extracting ever larger quanta of resources out of its own people. But at the same time, the two will be, and in fact will have no option but to be, seeking new modes of accommodation with each other. This means in turn that in the situation now evolving, we would do well not to speak of a historic contradiction between the Camp of Imperialism and the Camp of Socialism led respectively by the corporate kings of the United States and the Bolshevik Vanguard of the Soviet Union. For the two have been forced by the very nature of the weapons they have managed to acquire to enter into a state of a fateful and a potentially fatal *collusion*. And by no means should collusion be designated as contradiction. It follows that the two blocs may *not* be taken to be even in a state of Cold War with each other. For each is concerned with its own buildup as determined by the perceived domestic requirements of its own Establishment.

Instead, the contradiction must get crystallised and also find expression within each bloc: between the ruling circles on the one hand and the ordinary people on the other. Evidently, it is the ordinary people who have already to suffer many of the consequences of a hot war. Indeed, as far as the ruling circles of either bloc are concerned, they can only afford, and therefore must try, to have as their targets none other than their own people at whom are their missiles aimed. For the directions in which they are pointed do not really matter.

To be sure, the two superpowers rarely must miss an opportunity to condemn each other. But that usually amounts to no more than an exchange of compliments. So, if Ronald Reagan tries to denigrate the Soviet Union as an empire which is 'the focus of all evil in the modern world', the Russians on their part do not find it inordinately difficult to describe him as an imperialist warmonger. The more important thing is that it is in order to improve his image at home and thus to improve his electoral chances that Reagan also finds it useful if not absolutely necessary to invite Andrei Gromyko for dinner. Only, the Russians, not having to worry about an irrelevancy like the image at home, have no need to return such hospitality.

In any case, what matters here is to note that the two superpowers find themselves to be perpetually locked in a relationship so curious that each must perforce seek to appear to be unrelentingly obdurate towards the other and at the same time to be genuinely appreciative of its basic problems and positions. I should like to designate this relationship between the two as their MAO: Mutually Appreciated Obduracy. Occasionally, the Obduracy may in fact be Mutually Assisted, Adjusted, or once in a while even Antagonistic. But always, and necessarily, it is duly and deeply Appreciated, and at least in private, probably Admired and Applauded.

As far as a proper perception of the prevailing reality is concerned, therefore, I should prefer MAO to the currently used concepts of MAD (Mutually Assured Destruction) and NUTS (Nuclear Utilisation Threats). For to me, while MAO is the essential strategy of power in the world of today, both MAD and NUTS are mere stratagems meant to mislead the unwary and to legitimise the gargantuan quanta of power being stockpiled on either side.

## II

### MAO as Strategy

A strategy is but a way of realising a long-term goal. But given the very ultimacy of the destructive power of the weapons now in existence and given also the entirely myopic concerns of the two Establishments: conceivably the only way that the superpowers can try to avoid their own annihilation is for them to secure a lasting accommodation with each other. That is not peace proper, to be sure. But that is not immediate extinction either. And in any case, who ever said that the superpowers could ever be interested in anything more substantive than a purely working arrangement between themselves? An arrangement, moreover, which in effect is meant for the control and manipulation of the rest of the world through the creation and consolidation of the respective spheres of influence?

There does not have to be a formal treaty to this end. A tacit understanding is *all* that is needed and is all that they may have. But such an understanding can stem from interests perceived as common, and it is achieved, Paul Keal has written, "through unilateral acts or the conspicuous absence of certain acts". Further, a tacit understanding requires each party to understand "that the other understands that what each does depends on what each perceives the other as being likely to do". Accordingly, each makes choices which are consciously contingent. That is, choices which are deliberately opportunistic but still conditioned by the overriding need for mutal accommodation. As a result, when "the choices of each, in particular circumstances, fulfil the expectations of the other it appears that there is tacit understanding about how to behave in order to achieve a common end". Evidently, a tacit understanding in the present context may be characterised as one which causes or allows particular actions or inactions of the superpowers "which cannot or will not communicate directly about what is understood".[4]

Moreover, it is in order precisely to secure a more effective working alliance with each other and thus to remain entrenched, that the superpowers or rather their Establishments must also try to overwhelm their respective sets of people. It is to this end that each must try tendentiously to generate fears of the Other Side trying frantically to achieve a pre-emptive nuclear victory. For where else could the resources come from for the perfection and the production of the diabolical weapons—'weapons systems' in current jargon—and therefore for the continuation of the prevailing pyramids of power? For example, the way the arms control negotiations are initiated, suspended, resumed and dragged fits perfectly well into this pattern of the growling conjugality of the superpowers.

It is nothing but the logic of the existing situation which generates what C Wright Mills would have called the Higher Immorality of the Nuclear Age. And it is the inherent immorality of the behaviour of the superpowers which I must take care to emphasise. For else, I would have spoken of their mutually articulated and affirmed obstinacy, not obduracy. Besides, what we need to comprehend are the domestic dimensions and consequences of this unrelenting international obduracy. For as Michael Kidron and Dan Smith have argued:

> The international military order is not just a dangerous and unstable equilibrium between states. It is based on conditions *within* states, where power devolves on those who translate its spirit of universal siege into domestic policies. It reinforces the most

> regressive aspects of each national society. Waste on a colossal scale, centralised power, inaccessible hierarchies and overblown bureaucracies are complemented by mutual fear and hostility, the glorification of violence, the disabling of dissent and the curtailing of freedom and dignity. None of these is new, but all owe their contemporary severity to the international military order.[5]

One may add here that the expression 'mutual fear and hostility' in this statement ought to be taken to mean the panic which the ruling circles of either bloc try deliberately and artificially to create among their own people by harping relentlessly on the growing military might of the other. Deliberate threat-inflation through repeated reminders of the other's bids for military superiority is used by each side to create a kind of psychosis so that its own quest for resources at home remains unchallenged. And yet given the essential nature of the weapons involved: those already stockpiled and those being perfected: the very concept of military might loses all possible meaning. This being so, neither the 'growing military might' of any of the sides nor its bid for military superiority over the other than possibly mean anything. For a nation or a bloc can be taken to be militarily superior if and only if it has managed to acquire the power to inflict crippling losses on the enemy and at the same time has acquired the power to protect itself against similar losses. But this precisely is a kind of power which modern weapons do not allow any side to acquire. Indeed, the very excess of success, particularly in terms of blast power and radioactive fallout, which has attended their development renders them totally useless as weapons of war. Trying to sell their 'cost-effectiveness' perhaps, John Foster Dulles once spoke of 'more bang per buck' that nuclear bombs could produce. But he failed to see, or at least to admit, that the bangs taking place during a nuclear exchange, no matter how inexpensive to cause, could still turn out to be extremely costly in terms of their consequences. For they could bring about little less than the very extinction of the race. The cosmic dimensions of the bangs and the extreme toxicity of the radioactive fallout which would before long cover very large parts of the globe if not the whole of it could promise little else.

Little wonder that the one thing that the hawk(er)s of Socialism and of Freedom have not been able to do is to prepare some credible plans of military action leading to something which could be described as 'victory' in a nuclear war. All that we get are occasional and only too familiar bursts of brave but hollow rhetoric. Thus, Lieutenant Çolonel E Rybkin, a Soviet military theoretician of yesteryear, had this to say some time ago: "To assert that victory is not at all possible in a nuclear war would not only be wrong on theoretical grounds but dangerous as well from the political point of view."[6] We cannot figure out what the theoretical grounds could possibly be; and it seems that the word 'theoretical' was intended merely as a gloss of academic respectability for a statement which could not otherwise be made to make any sense whatsoever. However, the political dangers which the Colonel had in mind are more easy to discern: an affirmation of the impossibility of victory in a nuclear war would but be an affirmation of the illegitimacy of the political system which, its socialist pretensions notwithstanding, could not help create an ever-growing and all-devouring nuclear war machine. It is this which the Colonel must have been keen to prevent. For he went on with the further claim that "Any *a priori* rejection of the possibility of victory is harmful because it leads to a disbelief in victory". Now, what could one make out of this rather profound circularity even if one wished to emphathise with him over what he called 'moral disarmament' and 'fatalism and passivity'?

The votaries of freedom do not turn out to be a lot more convincing when they come to talk of the distinct possibility of their victory. One may refer here to an article by Colin Gray and Keith Payne. Indeed the very title they have given to their article—'Victory Is Possible'—is strongly reminiscent of what the Mad Hatter once told Alice: one can say what one means without meaning what one says. For the only meaning which one can assign to their article is that anything that could be legitimately described as victory would not be the outcome of a nuclear exchange: yet they affirm its possibility in the title itself. And this is what they say:

> Strategists cannot offer painless conflicts or guarantee that their preferred posture and doctrine promise a greatly superior deterrence posture to [the] current American schemes. But they can claim that an intelligent US offensive strategy, wedded to homeland defences, should reduce US casualties to 20 million, which should render US strategic threats more credible. If the United States developed the targeting plans and procured the weapons necessary to hold the Soviet political, bureaucratic, and military leadership at risk, that should serve as the functional equivalent in [the] Soviet prespective of the assured-destruction effect of the late 1960s.[7]

It is worth noting here that the necessary condition for this 'victory plan' to be executed at all is the American willingness to accept a minimum of 20 million deaths. The number of survivors who would inevitably be exposed to radiation and suffer its effects is not indicated. All that we are told is that the American willingness to accept 20 million casualties would render the US strategic threats more credible. How does that get translated into victory is not at all clear and is not made clear. But the really serious difficulty with this victory plan is that the liquidation of as many as 20 million people in a sudden flash as it were and the paralysing and corresponding destruction of the American economy will not leave behind a functioning society. With such a society itself having vanished into thin air, the very idea of victory will cease to mean anything whatsoever. Besides, the only practical steps which the authors suggest towards the end of the passage quoted would be directed towards holding the various components of the Soviet leadership 'at risk'. Which will bring the world back to the MAD-ness of 'the late 1960s'.

And surprising though it may seem to Gray and Payne, that does not sound like anything that we or even they could designate as victory. Little wonder. For, as C Wright Mills saw it even as early as the mid-fifties, the Nuclear Age could not conceivably have any literature of victory. For given the means of violence that existed even then and have now been further developed, it would be impossible to prepare either a war plan or an image of victory. The 'massive retaliation' which Dulles for instance threatened the Russians with could only be a violent diplomatic and political convulsion which was but a recognition of the fact that an all-out war between the two blocs would bring about their mutual destruction.[8] And of the rest of the world, too.

The unwary might imagine that this in itself should lead to a war-less world. It should but it does not; and at least has not. The powers that be on either side do seem to perceive the fell hazards of having a nuclear go at each other. But instead of trying to de-escalate the process of militarisation by pruning their military budgets and buildups, they seem hell-bent on re-escalating it. It follows that the unprecedented proliferation of the vehicles of ultimate violence is intended not to ensure any kind of military victory for either side over the other. It is meant instead to ensure that the two pyramids of power are able to remain entrenched in their respective domains.

This way of looking at reality is no longer confined to those who reject the very legitimacy of the prevailing pyramids of military and political power. In fact, it seems to have infected even some Establishment scholars who write for such journals as the *Foreign Affairs*. One such is Authur Schlesinger who, while speaking of the 'recurrent Pentagon panics', declares that Pentagon officials seem to take masochistic pleasure at regular intervals in declaring that the Soviet Union is now stronger than the United States. Therefore, he doubts if defence officials really believe their own lamentations. For none of them is known to have offered even for the sake of an argument to trade in the American for the Soviet defence Establishment. This point may not be dismissed as one which is overly wild. For not long ago, when asked in Congress if he could change places with his Soviet counterpart, the Chairman of the American Joint Chiefs of Staff said, 'Not on your life'. Schlesinger goes on to add:

> The irony is that the Pentagon and the Soviet Defence Ministry prosper symbiotically. There is no greater racket in the world today than the generals claiming the other side is ahead in order to get bigger budgets for themselves. This tacit collusion, based on a common vested interest in crisis, remains a major obstacle in the search for peace.[9]

In the Establishment perspective, 'the search for peace' requires not general and complete disarmament but some sort of a control over the production and deployment of arms. So far, this has only meant some regulation of the pace at and the direction in which nuclear weapons can be stockpiled by the two sides. Indeed, such is the crooked logic of the prevailing situation that there has not been a single arms control agreement which has not allowed higher ceilings than the levels of stockpiles which existed at the time the negotiations leading to it were initiated. Therefore, as William Epstein has argued, there have never been any arms control agreements at all but actual blueprints for the continuation of the accumulation of nuclear weapons by the two sides 'under agreed terms and conditions'.[10] In other words, what is made to pass for arms control is nothing but a somewhat planned decontrol of the development and deployment of modern weapons. Which is also to say that the institution of arms control is intended essentially to formalise the already tacit and abiding collusion between the apparently rival Establishments. Each takes care that the other's legitimacy which on occasion may have to be jolted a bit is not actually destroyed. It is this situation which arms control formalities do not disturb. In fact, as William Arkin and his colleagues have only recently argued, "If arms control didn't exist, it is hard to imagine how the existing weapons acquisition process would have been different".[11]

Particular reference may be made here to SALT Agreements which never stipulated *any* reductions in the stockpiles nor any limitations on the technological 'improvements' of weapons. Rather, they provided for higher ceiling figures than those that existed already. It follows that each superpower is primarily addicted to *its own* arms buildup; and the arms competition between the two, if any, must be purely secondary. In this connection, one may refer to the stipulations of the SALT II:

> It set limits on numbers of launchers and sub-limits on the numbers of MIRVED launchers, which would oblige each side to dismantle a token number of operational systems (33 US, 254 USSR). For this, obsolete systems that were due to be retired could be chosen. It imposed a limit below the maximum technically possible on the numbers of warheads permitted for existing MIRV launchers and of cruise missiles per heavy bomber (fixed at the maximum load of a B-52). In addition, each side would be permitted one new ICBM system. Ceilings would be imposed on the 'throw-weight' of the missiles and on certain other offensive weapons not yet developed (the Outer Space syndrome). So congenial are these terms to the respective military establishments that even without Senate ratification they appear to be observed any way.[12]

It follows that the problem is not one of controlling the arms but one of controlling the 'armers'. And it is the armers who, given to preserving their respective constituencies, would not let the world slide towards genuine disarmament and peace. The most they can afford to allow is a somewhat regulated proliferation of arms. It to this end that they resort to MAO as the very best conceivable strategy.

## III

### MAD and NUTS as Stratagems

It is ironical in the extreme that while the two superpowers are virtually *bonded* together through MAO, and have no option but to be so bonded, they pretend vehemently to be opposed to each other and this to the point that they can manage even to assign formal designations to their incompatibilities. These designations are MAD and NUTS. However, nothing but the very logic of the prevailing situation demands that MAD and NUTS be understood as mere stratagems more or less tendentiously articulated by the ideologues of the powers that be to confuse and to mislead the underlying populations.

The point I wish to make here is this: The unending proliferation of ever-diversifying weapons systems ought not to be taken as a response to the dictates of MAD or NUTS. Rather, MAD and NUTS ought to be seen as pseudo rationalisations of the inexorable process of weaponisation. But pseudo though they are, they have nevertheless been bought wholesale even by the literati. Little wonder that the powers that be do not find it inordinately difficult to promote their misperceived and earth-eating interests. What needs to be noted here is the fact that sufficient destructive power had already been stockpiled by the early sixties when MAD began to be offered as an explanation. Also, when weapons accumulation continued to proceed far beyond what could possibly be needed for MAD purposes, NUTS came in as an alternative justification. This is not to say that MAD has been completely replaced by NUTS. Rather, it continues to get full-blooded academic support even now.[13]

But to my mind, both MAD and NUTS are products of intellectual miscarriage and we have no option but to dismiss them as entirely untenable. Let us therefore take them one by one.

MAD can be sustained in terms neither of logic nor of plain commonsense. It presumes that each side is basically rational and would therefore do everything in its power to avoid a situation which could not but spell common and more or less simultaneous suicide of the two. In other words, neither side will like to be the first to mount nuclear aggression. For it could not but expect to suffer its own annihilation through the retaliatory strikes of the other side.

This only means that the moment MAD becomes a perfect arrangement, it destroys itself as an international regulatory mechanism: To each side, the other side, being perfectly rational, ceases to pose any nuclear threat whatsoever. Which, since it can result only in the common and complete destruction of the two, ceases to be credible.

Let us for a moment ignore this difficulty and focus instead on a basic presumption of MAD. Which is that each side is deterred from mounting the first nuclear strike merely because the second strike which the other side will make in retaliation will cause a kind of damage to its population and industrial centres which it finds to be entirely unacceptable. This means that there must be an absolute upper limit to the kind of damage which each side must find to be *acceptable*. But given this limit, there must also be a limit on the amount of weaponry which each side may accumulate. For else, MAD would mean nothing.

Indeed, the conclusion is inescapable that no matter whether the two sides are rational or not, MAD cannot explain the relationship between the two. On the one hand, it is destroyed, as we have seen, by the perfect rationality of each side at the level of logic. And on the other, it is destroyed by the irredeemable and 'perfect' irrationality of the two sides at the level of empirical reality as manifested in an unending and reckless development and deployment of a large variety of unusable weapons systems. And this irrationality is paralysing in its own way. It causes an irrevocable diversion and destruction of resources and at the same time engenders varieties of societal chaos and dysfunction.

Nevertheless, entirely undeterred by considerations such as these, the military machines of the two blocs have continued to churn out an infinite variety of nuclear death-heads and the associated vehicles for their delivery. The result can be and has been dramatised in many ways. The commonest of these, as we have seen, is to say that all the nuclear blast power now available totals upto 20 billion or 20 thousand million tons of TNT equivalent. What could possibly be done with this kind of blast power no one does or can know. But an attempt at visualising the kind of overoveroverkill it represents may still be made. Philip Morrison reminds us that in order to be transported from one place to another, just one million tons of ordinary TNT would require a 250-mile long train of boxcars.[14] This only means that if the blast power now congealed in nuclear warheads could be converted into ordinary TNT, the world would then be straddled with as many as 20,000 of such trains.

The affront involved here is that we are expected to acquiesce in this pointless proliferation of destructive potential to the extent that we may actually begin to accept it as something essential for our own survival. For each side claims to be acquiring more and more of these weapons only to prevent or rather 'deter' the other side from using them and thus sparing us the resulting annihilation.

But how many weapons would be enough for purposes of deterrence? This question is generally not raised—by those in power in any case. And since, not having raised it, they don't seek to answer it either, deterrence becomes an excuse for literally limitless buildups. Nikita Khrushchev was the one major politician who, while in power, dared to question the wisdom of such reckless proliferation; and he did not have his way. Indeed, he did not last long after having declared in May 1960 that "missiles are not cucumbers, one cannot eat them and one does not require more than a certain number in order to ward off an attack".[15] He faced determined opposition from the civil and military hawks of his country. And it is possible that it was only in order to retrieve his position thus lost at home that he launched his notorious misadventure in Cuba. Which brought his downfall all the same. Riding a tiger cannot possibly be the most pleasant of experiences. Incidentally, President Kennedy chose his Inaugural Address itself to make the point that "we should always remember that, in the past, those who foolishly sought power by riding the back of the tiger ended up inside". But if what had been done in the past was intended to be a lesson for the future, he hardly even tried to learn it. On the contrary and with the solitary exception of Ronald Reagan, he brought about a much greater expansion of the arsenals of the United States than any of his predecessors or successors. But the basic novelty of the present situation lies in the fact that the tiger itself has become monstrous enough to be able to swallow the entirety of our race and not just those who might be riding its back.

Be that as it may, it seems impossible to explain or justify such an exploding accumulation of explosive power as is now taking place for purposes of mere deterrence. There were just three nuclear bombs available in 1945; and there are as many as 50,000 'warheads' in existence now. One may also note here, though in passing, that even the literati are often heard saying that the bomb which razed Nagasaki to the ground has been the last nuclear weapon ever to be used so far. But to accept such a claim, we would perforce have to ignore all the nuclear and thermonuclear bombs exploded for 'experimental' purposes over the Marshall Islands for example and the extreme damage suffered by the Marshallese and their habitat, and ignore also the 'collateral' damage caused by tests elsewhere. However, the essential point is not that these weapons have not been used after 1945 in some narrow sense of the term. The point rather is that they have continued to proliferate and according to Ruth Sivard, some $ 900 billion may have been spent over the years on perfecting and producing them.[16]

It is as a result of such generous misallocation of resources to this task that the USA, for example, has been able to add the equivalent of one Hiroshima bomb to its arsenal about every 30 minutes since the end of the Second War: that is 12.5 kt of explosive power every 30 minutes for 38 years, day and night, seven days a week.[17] And the USSR, having started late, may have fared even 'better'. Projections for the future are still more daunting in so far as the US nuclear arsenal is going to be expanded by as many as 21,000 warheads during 1983-1993.[18] In other words, this would only be the net addition to the stock of warheads already available. The total number of warheads to be fabricated during this period is over 37,000.[19] As far as one can surmise, and one can do little but surmise, the Soviet plans may not be inordinately modest in comparison. Indeed, Yuri Andropov did manage to declare, before he went out of circulation, that they were going to have their own MX-system. Given the imagination, Siberia, it seems, can have an unending variety of 'uses'.

The point of it all is that by no stretch of the imagination can all this obsessive weaponisation be squared up with the requirements of MAD, no matter how wildly exaggerated. Much less can it be squared up with the needs of NUTS. For what the very idea of NUTS is intended to suggest is the winnability of only a very limited nuclear war. Granting that such a war can in fact be fought: it must be a war which will result only in a limited though unspecified number of deaths: a war which will be confined to a specific and limited geographical area, though it could not but cause a complete and unlimited devastation of it: and a war, moreover, which will not consume more than only a small fraction of the nuclear blast power in existence. But if an accelerated accumulation of this blast power continues unabated, the small fraction of it intended to be used in a limited war will itself have grown to a large absolute quantity: so large, indeed, that the war will be limited no more. But if the two sides do not just envisage using a given fraction of the stockpile available, but agree instead to using a fixed absolute amount of megatonnage, and then wait for victory, there is no sense in producing vast amounts of the blast power which are not even meant to be used. Therefore, the concept of a limited nuclear war cannot be reconciled even on paper with the fact of unlimited accumulation of nuclear weapons. In fact those who consider it feasible to use only some of the nuclear weapons available cannot even define the 'someness' of the 'some'. In other words, nuclear weapons must get used either in bulk or not at all. As T C Schelling once put it, "There is a simplicity, a kind of virginity, about all-

or-none distinctions that differences of degree do not have".[20] It follows that NUTS is as untenable a concept as MAD.

Both are no more than mere excuses or stratagems invented by the powers that be in order simply to continue to proliferate an unending variety of weapons systems for reasons far from honourable.

Also worth noting here is the fact that NUTS is not even a lame excuse for proliferation: it breaks down at the conceptual level itself even when we allow the feasibility of a limited nuclear war. But such a war is *not* feasible: Either it must never be fought at all or it cannot but escalate into an all-out nuclear holocaust. This even those who are ostensibly sold on fighting and winning a nuclear war seem to recognise. Thus, while speaking at the Naval War College in August 1980, Harold Brown, the US Defence Secretary at the time, called for such a buildup of nuclear war-fighting capability as would provide greater deterrence by demonstrating the ability of the United States to respond in a credible fashion without having to escalate 'immediately' to an all-out nuclear war. Nevertheless, he took care to add also that he thought it was 'very likely' that the use of nuclear weapons by the superpowers at any level would escalate into a general nuclear war.[21] It seems that having already proliferated entirely unusable weapons far beyond the limits of absurdity, and unwilling still to face the crazy consequences of their reckless policies, literally the only thing that the well-installed security managers can do is to make crazy decisions and crazy declarations.

Little wonder that the situation is getting crazier and crazier. We are told that were the United States and the Soviet Union to exchange 'only' a few thousand of the warheads they are now known to possess, they could kill each other's urban populations and destroy most of each other's industrial capacity. This, as we would see presently, is a gross understatement. But even if the damage were no more serious than this, it is easy to see that as a result of such an exchange, each of the combatants would cease to function as something that could be recognised to be a society. In fact, so diabolical is the kind of destructive power now available that a single Poseidon submarine captain could fire as many as 160 independently targetable nuclear warheads, each with a yield several times larger than those of the weapons which destroyed Hiroshima and Nagasaki.[22] Assuming that there were no technical breakdowns of any kind at any level, the fate of as many as 160 Soviet cities would thus be sealed more or less instantaneously. This alone could perhaps result in some 30 million 'fatalities' which is the Pentagonese for 'deaths'. The United States, being a sanctuary no more, could hardly expect to escape similar devastation.

## IV

## The Biospheric Imperative

But what even such dire prognostications fail to take into account is the existence of something which is very intricate, very vulnerable and at the same time vitally important for our existence itself. This is the biosphere, a major imponderable which remains unaccounted for, if not entirely unperceived, by the war gamesters of the Pentagon or of the Kremlin. Or, if they do manage to take it into account, they do not let it influence their calculations: such calculations at least as are meant for the consumption of their respective populations. In any case, they do not let their policies be affected by the biospheric imperative. But how absolutely vital is it to make these policies respect this imperative follows from an observation which Norman Cousins made many years ago:

> It is impossible for any nation to wage nuclear war against another nation without also waging war against the human race. The winds are the conveyor belt of mass death. The nuclear gun contains three barrels: one is pointed against the enemy; a second is pointed against people who are not enemies; a third bends back completely and is pointed squarely at the holder.[23]

This means that it would be impossible for the Poseidon captain to destroy only the Soviet cities. He would inevitably be raining death on Soviet villages too; and on the villages and cities of the United States and of the rest of the world as well. Besides, he would be doing all this even if all his shots went wide of the mark. No inaccuracy and lack of precision in aiming would matter. Even so, when Norman Cousins wrote of the nuclear gun having as many as three barrels, winds were the only known carriers through which death unleashed by nuclear explosions could travel.

But it is now known that thousands or even hundreds of such blasts taking place more or less simultaneously would not just unleash death directly, but would also promote it indirectly by causing a catastrophic depletion of the ozone cover of the Earth. This would expose most life-forms on the planet, including our own, to ultra-violet radiation of the Sun. Evidently, madness alone can flow out of the barrel(s) of a nuclear gun.

Reinforcing this assertion is the very strong possibility of a nuclear winter to be triggered by these explosions. Experimental verification of this formulation would obviously be impossible. But the lack of such verification is no reason why we should dismiss or even discount a possibility which at least common sense does not seem to exclude. We don't have to go into the nuclear winter argument here. All that we have to note is that some hundreds of nuclear explosions taking place within a few hours will throw up hundreds of millions of tons of dust and debris into the atmosphere, its uppermost reaches not excluded. This is what volcanic eruptions also do. But the quantities involved in this case will be incomparably larger, and will inevitably shut out most of the light from the Earth for several months. The resulting climatic catastrophe will in itself be enough to kill people and destroy vegetation including crops. In the circumstances, as Carl Sagan has argued, the decision to launch a nuclear attack will amount to little less than national suicide for the attacking side too even if the attacked nation does not lift a finger to retaliate: "If a first strike gains no more than a pyrrhic victory of ten days' duration before the prevailing winds carry the nuclear winter to the aggressor nation, the 'attractiveness' of the first strike would seem to be diminished significantly".[24]

It follows that there can be no such thing as a limited nuclear war in Europe. Of course, if the superpowers were to sign some sort of a Protocol of Annihilation, they could still manage to fight exclusively in Europe. Perhaps, it is in anticipation of some such contingency that the United States, for instance, has deployed on the average one Hiroshima-level warhead for every 50 American soldiers and support troops stationed there.[25] Even so, in terms of *consequences*, a Eurocentred nuclear war could not possibly be confined to Europe. Within weeks if not days, the rest of the world will follow Europe to nuclear sleep. E P Thompson said once, "US scenarios for a limited war in the European theatre do not amuse us: This is where we happen to live"[26]

It seems now that the scenarios of a nuclear war even scrupulously and entirely fought in Europe may not amuse anyone living anywhere on the Earth. For the Third Planet is a single unit and so is the sphere of life around it. Which, after the Greek Earth goddess, James Lovelock has designated as Gaia. This must perforce mean that even if only a part of a living unit like Gaia is exposed to the cosmic fires caused by hundreds if not thousands of nuclear explosions, the whole of it would be destroyed.

Military managers of the superpowers cannot possibly be unaware of this possibility. Certainly, their scientific advisers cannot be so unaware. Else, they would hardly be worth their salt as scientific advisers. But they, the managers and their advisers, remain entirely undeterred. Apparently presuming that the weapons, whether already available or yet to be developed, will somehow remain unused, they are now planning to launch another and so far the craziest and the most reckless round of producing them. To be sure, the initiative still lies with the United States. But if the US goes the laser-way, can the SU be far behind? In particular, because Reagan, an exceedingly good boy that he is, has himself promised that in case the United States can build a foolproof anti-nuclear shield, she would share the technology with the Soviet Union?[27]

We are told that attempts will now be made to put purely defensive weapons in space so that incoming missiles could be destroyed with lasers and particle beams and thus prevented from exploding and doing any damage whatsoever. Already, with a characteristic mixture of chicanery and hucksterey, Ronald Reagan has asked the scientists of the United States who developed the nuclear weapons "to turn their great talents now to the cause of mankind and world peace" and produce "the means of rendering these nuclear weapons impotent and obsolete".

Reagan made what has been commonly described as his Star Wars speech in March 1983. But in so far as the war would take place not light years away but here around the Earth itself and would most certainly cripple its biosphere, it is hardly an apt description. Be that as it may, it was noted immediately that his "Video-game vision of satellites and other weapons that might some day zap enemy missiles with lasers or particle beams and the drama surrounding his unexpected announcement were (at least) partly a political ploy to change the context of the debate over defence spending".[28]

In any case, some leading members of the 'scientific community' whom he had addressed were quick to point out that a perfectly leakproof Ballistic Missile Defence (BMD) system could not be devised at all so that even a small fraction of enemy missiles beating it would cause millions of deaths and immense socio-economic havoc. According to Carl Sagan for example:

> Optimistic informed estimates of porosity or 'penetrance' (the fraction of attacking missiles successfully detonating at their targets despite the BMD) are no lower than five to 30 per cent. The present world arsenal of strategic warheads is so much greater than the threshold for climatic catastrophe that even if five to 30 per cent of attacking missiles got through in something like a full exchange, the catastrophe could be triggered.[29]

But even if such a system could at all be devised, there would be nothing particularly 'defensive' about it. As Simon Ramo put it, "Who says that this technique will be used only to knock out missiles in the sky? If it's such a good technique, why not use it to knock out things on the ground?"[30] Where, moreover, the hits could be surer? But it really is not such a good thing at all, and as Hans Bethe has also warned, one can be as 'optimistic' as one can be within the limits of the laws of physics and geometry, but the system remains unworkable.[31]

But what to my mind has not been even noted, much less emphasised, so far is the crippling impact of this science-fictitious bizarrerie on the biosphere. This it will have in being assembled in space and also in being used. For, in the first place sending such systems into orbit will require immense expenditures of energy which in itself will have extremely serious environmental consequences. There are indications that a comprehensive system of this kind will consist of over a hundred satellites. Which "in turn would need literally thousands of space shuttle sorties to assemble".[32] But Daniel Graham, a 'High Frontiersman' himself, is thinking in terms of over 400 'killer satellites'.[33] And this would mean many, many more thousands of space shuttle sorties. And as far as actually using the laser guns is concerned, at least two sources of environmentally disruptive effects might be specified: (a) Innumerable Hiroshima level nuclear explosions would probably be needed to generate the energy which in turn would be converted into lasers. What it will mean for the environment, particularly that part of it which a country with a laserised defence system could call its own, can better be imagined than described. Also (b) even if all the enemy missiles are effectively destroyed at one stage or the other, very large quantities of unexploded plutonium and other radioactive material will be scattered and before long will reach various parts of the globe. Considering that just ten pounds of plutonium which is the most toxic substance known to man, would, if 'evenly' distributed, expose the entirety of the human race to a variety of cancers.[34] such scattering is not something that any nation can view with equanimity: not even the one which is firing the laser guns.

This does not exhaust the list of objections against a laser-based BMD. But it should be clear already that it is a "dangerous hoax and a cruel and potentially expensive exercise in self-deception".[35]

Does all this mean that "we are fated to live in a MAD world" so that the "principal hope at this time will not be found in seeking NUTS doctrines that ignore the MAD realities but rather in recognising the nuclear world for what it is and seeking to make it more stable and less dangerous"?[36] I think not. For such a view follows from an elitist perception of reality which excludes the inevitability of the erosion of the power of the powers that be. And yet that is the way out of the nuclear world, MAD, MAO, NUTS, BMD and all.

## V

### The Limits of Overreaching

Power and self-destruction are but two sides of the same coin; and as such, overreaching is not an invention of the twentieth century. But the ultimacy of overreaching is. For it is the specific means of power available today which lend to overreaching an entirely unprecedented grimness: a kind of apocalyptic and global character that it has never had before. In fact, even as the Ancients knew, overreaching was by definition counterproductive. For in failing to restrain oneself in time, one could well be ensuring one's own destruction. This was the point, for instance, of the Greek legend of Icarus. Daedalus, his father and a highly skilled craftsman, made wings for them both so that they could escape from the labyrinth of Crete. But the wings were attached to their bodies by wax; and heedless of his father's advice to the contrary, Icarus flew higher and higher and got too close to the Sun. The wax melted, and he fell into the Aegean Sea.

The 'wax' in the legend suggests that technology, particularly if it happens to be very daring, must have some crucial weakness or the other. Evidently, the destruction of Icarus can be explained in terms of his refusal to recognise the inherent limits of technology. The moral is not that technology as such must be discarded but, as the successful escape of Daedalus suggests, used within limits and with care.

To Geoffrey Whitney, the author of "A Choice of Emblems" (1586), this legend was clear 'evidence' of the inevitability of the retribution which would be meted out to those 'Whoe seeke the thinges to mortall men deny'de'. But it was essentially an allegorical warning against overreaching. And it is hardly surprising that an Icarus falling headlong into the sea should have served as the emblem of self-destruction for "The Tragicall History of Doctor Faustus" (1593), the last and also the greatest play that Christopher Marlowe ever wrote in developing his conception of the futility of overreaching.

But it is not a little ironical that precisely at a time when Marlowe was playing the spotlight on the inexorability of the movement towards self-destruction of the individual overreacher, history was getting ready to give birth to a civilisation which would in our own day confront mankind as a whole with the wages of overreaching. In other words, and in due course, overreaching would cease merely to be the hamartia, the tragic flaw, of the individual hero in life, legend or literature. Infinitely more serious, it would become the bane of the entire race of humankind.

An obvious question that one could raise and try to answer would be: How did it happen? And another would be: Can we see any limits, preferably built-in limits, to a process which so far has been inexorable and has in fact overwhelmed the world with its inexorability? Both these questions are significant, and unsurpassably so. But, and at least in the present context, I consider it a lot more important to try to answer the second of the two.

In what follows, therefore, I would like to see if, having been overwhelmed by overreaching so far, we can overwhelm it now: to arrest and to reverse it. I think one can answer this question in the affirmative. In any case, if there is any hope for our race today, it lies only in its ability to provide sufficient justification for an affirmative answer to this question.

It seems necessary to affirm here that overreaching is by no means to be taken as something which may have been written into the genetic code of man. In other words, it is not an integral part of what would be called 'human nature'.

Instead, it is an absolute compulsion of Power. For it is only through overreaching that the powers that be expected to be able to retain their power. This is not to say that they see their pursuits as a continuing exercise in overreaching. For if that were so, the world today would be a much safer and a sounder place than it actually is. Rather, the pursuits in question are little but products of what C Wright Mills once called 'crackpot realism'. Which, as defined by him, is a tendency to become so rigidly focused on the next step as to become creatures of whatever the main drift brings.[37] Each step seems rational and even critically essenti ' to the perpetuation of the *status quo*. But the 'main drift' is directed towards disaster.

This only means that the powers that be cannot but take a purely short-sighted view of their own interests. For what they always do to remain installed is ultimately destructive of all that sustains them as also the power-less. But an absolute inability to 'see' this fundamental truth is what short-sightedness is all about. The ruling circles of all times and of all climes become victims of their own misperceptions. Only, the misperceptions of the ruling circles of today are exceedingly dangerous. E F Schumacher once spoke of the cheerful brutality of Lord Keynes's well-known dictum that in the long run we are all dead. But the brutality of this statement can be cheerful no more. For Keynes could only have been thinking in terms of everybody taking his own turn to die, so that at any given time, the race as such would still be alive. But, as against this, a nuclear war would send us all to an everlasting sleep at the same time, so that there would be no one left to perpetuate the race.

All the more reason why we must see that the attenuation of Power today is vitally important for our existence as a race. To this end, we must take care to dismiss as tendentiously generated illusions what the 'decision-makers' try to sell as self-evident truths. The most dangerous of these is the blatant lie that their quest for more and more weapons is only in response to the growing strength of the 'enemy'. For the literally insatiable appetites for weapons which the two Establishments can be seen to have can only be explained in terms of bloc-internal considerations and not in terms of external military threats which are deliberately exaggerated. Besides, weaponisation of the kind which has been taking place for nearly four decades now can spell nothing but increased or rather intensified insecurity and not, as claimed, any kind of security.

The moment we see this, we can begin to perceive the grim meaning of an assertion like, for example, the following which John F Kennedy made at the time of his Inauguration: "We dare not tempt them with our weakness. For only when our arms are sufficient beyond doubt can we be certain beyond doubt that they will never be employed". But since the sufficiency in question was defined implicitly only in terms of the domestic requirements of the ruling elite, it became in effect an excuse for an open-ended development and proliferation of weapons.

The situation has become so ludicrous now that Ronald Reagan, for example, can manage to ask for truly astronomical sums of money for two opposing requirements: on the one hand, a space-based BMD system which according to him will render all nuclear weapons 'impotent and obsolete' and on the other, as many as 21,000 additional nuclear warheads to be produced during the years 1983 to 1993.

Remember that as per Reagan's own declared intention, the very purpose of laser battle stations is to save lives and not to avenge them. This only means that he and his mates are in any case not thinking even in terms of a second strike but rather in terms of avoiding such American 'fatalities' as might otherwise be caused by a Soviet first strike. If that is so, why would the United States need the additional 21,000 nuclear warheads? One could think of two possible reasons: (a) To neutralise the damage caused by the Soviet missiles leaking through the new BMD system; and (b) To meet the American 'Defence' requirements till the new system got developed and deployed. But on either count, a mere fraction of the existing stock of overoveroverkill would do. Why add to it no less than 21,000 nuclear warheads over a period of no more than ten years? The conclusion is inescapable that the reasons are other than military.

I believe it should be not at all impossible even for the Americans to reject Reagan's queer ideas concerning defence and security. In particular, because the economic and social costs of this kind of insensate weaponisation which are already extremely high are bound to become higher and yet higher. The menacing and the mounting budget deficit which has been described as America's Economic Black Hole and which Reagan wants to fill with the help of Tax Cuts and escalating military expenditures, may be taken as an index of these costs. And, then, a centrally planned economy that it is, the Soviet Union must perforce have its own economic black hole. Which cannot but spell corresponding burdens for the Soviet people.

I find it inconceivable that people can continue to endure these burdens indefinitely. For massified that they now are, as Paulo Freire would say, by the illusion builders of the two Establishments, they must refuse some day to accept these burdens. One only hopes that that day is not very far off.

As I see it, then, the sheer cost of overreaching determines the outer limit which it cannot surmount. But in refusing to accept the costs, people would in effect question the legitimacy of the power of the powers that be. The virulence of this power and therefore the power itself must begin to get attenuated.

Precisely such a beginning will mark the initiation of a truly fundamental revolution in the history of our race. Once that happens, the issue no longer will be one of moving from a world disfigured by a plethora of nuclear weapons to another distorted by a preponderance of 'conventional' weapons. For a non-spurious alternative to an excess of nuclear weapons does not lie in an excess of precision guided missiles and fuel air explosives but in disarmament and peace. Which only means that what we need is a kind of societal reorganisation so thorough that it would define security in terms of mass participation in economic and political activities and thus in terms of the conservation of resources and sustainability and not in terms of the mounting mountains of lethal junk. Perhaps, this would still not be a world completely cleansed of all military equipment. But it would still be a world which will have only such kinds and quantities of weapons as do not promise to destroy what they are said to be in defence of.

For this to happen, our race will have to become sapient enough so as to be in a position to refuse to live with the escalating costs of the prevailing world military order and with the very ultimate risk of Extinction which is inherent in it. To this end, it will need nothing less than 'a leap in consciousness' so large as to help it initiate 'a chain reaction of awareness'. But I should like to conclude with an acknowledgment to the effect that I have borrowed the phrases just quoted from one of the greatest men and visionaries of all time: Albert Einstein.

# Agrarian Policies of Left Front Government in West Bengal

**Ashok Rudra**

BIPLAB DASGUPTA, in a series of three extremely interesting articles (*EPW*, Reviews of Agriculture, March, June and September, 1984), has covered a huge ground in Indian agricultural economics, focusing attention on agricultural labourers and tenancy relations in their proper historical perspectives. While the historical part of the papers is highly informative and valuable, it is unfortunate that he has messed up matters by trying to take up in the same papers a defence of the agrarian policies of the Left Front Government of West Bengal of which he is an important office-holder and a leading spokesman. Historical narration and their analytical treatment go ill with the polemical style of rebutting all criticisms that might have been made of the West Bengal government's policies. It is in this latter part of his papers that he has made plentiful references to me, many of them critical. Though, curiously, he has made more references to me for presenting evidence in terms of facts and figures for making positive propositions, or refuting views held by some others, I shall try in the following to defend positions held by me against some of his criticisms.

Dasgupta starts with the usual litany of West Bengal being only a state in a federal set up in which there is an excessive concentration of power at the Centre, which puts severe limits on what a state government can achieve. It is ironical that such a point should be made to a person like myself who, since his two years of experience of serving the first Communist ministry in Kerala, has been arguing tirelessly that it is futile for any left party to form a government at the state level and expect to serve the cause of the toiling masses. However, it is a brand new original thesis of Dasgupta that "as long as the rest of the country's agrarian relations are being dominated by the bourgeois-landlord combine, the picture in West Bengal cannot be any different ... agrarian relations in West Bengal cannot be segregated from that prevailing in the rest of the country". This is indeed new, because till recently it used to be said that land reforms being a state subject, a Left government in a state can do a lot, while it can do nothing about controlling monopoly houses. Of course this new thesis comes together with a whole lot of policies identical to those pursued by the Centre, e g, free trade zones, dropping of the programme of land confiscation and redistribution, raising of procurement prices of foodgrains to placate rich farmers, etc. Earlier-held policy stands are all being discarded one after another in the name of West Bengal being only a part of the Indian Union. India as a whole being dominated by capitalists and landlords, the logic of the Left Front seems to suggest that West Bengal government has also to do everything possible for promoting capitalism and landlordism. In this connection, Dasgupta throws a challenge at me that I shall not be able to substantiate my points by quoting from "the manifestoes or the formal political statements of the Marxist parties in the Front". I readily concede this particular point. The Left Front leaders are accomplished practitioners of double-talk. They write one kind of things in their formal party documents and say another kind of things when issuing press statements and making public speeches. (The latest blatant example is the Secretary of the Front issuing a statement certifying Indira Gandhi having been a democrat whereas in all formal documents the Front accused her of 'authoritarianism'.) It is the latter which carry influence with the public and it is perfectly legitimate on the part of a critic to seize upon these public statements rather than refer to the party documents.

A point made by Dasgupta is that one cannot argue about what proportion of sharecroppers has already been registered under Operation Barga, for that "presupposes that the total number of sharecroppers is already known, whereas ... there can be no way of knowing the number until each and every sharecropper has been identified". This is indeed highly interesting and amusing. It seems that spokesmen of the Left Front like Dasgupta want to have it both ways. When we argue that the NSS estimate of sharecroppers is only about twelve lakh whereas the number of agricultural labourers is several times more, so that any radical land reforms programme has to treat agricultural labourers as the target group and not sharecroppers, we are told that the official estimates are under-estimates and the importance of sharecropping in reality is much greater than that suggested by those estimates. From the very beginning of its rule, the Left Front has been advancing in all its public utterances and writings in its official organs a figure of 20 lakh for sharecroppers to be registered. Thus, as late as on January 24 of this year, the senior minister, Benoy Choudhury, stated to the press: "... of the 20 lakh bargadars in the state only 13 lakh have so far been recorded". If however we make the point that the Operation Barga has not managed to record more than two-thirds of the bargadars, we are found fault with by Biplab Dasgupta for inventing the figure of 20 lakh!

The point made by us that in carrying out Operation Barga party interests are being given a lot of importance is too well known a phenomenon to call for serious defence. Everywhere in West Bengal one knows of jotedars who have not been touched either by the Operation Barga or by the ceiling legislation or by any other land reform measures because of their extending financial and other support to the ruling parties.

We may now move over to Dasgupta's treatment of agricultural labourers. It is here that in most cases when he has made some factual statements he has depended upon findings of surveys conducted by ourselves, singly or jointly with Pranab Bardhan. On the other hand, whenever he has thought it fit to contradict some propositions of mine, he has merely made assertions without making any reference to any surveys conducted either by himself or by anybody else. It requires a special kind of arrogant self-confidence to sweepingly reject propositions based on surveys on the basis of nothing but one's own opinion or impressions, especially when those very surveys of ours are considered sound enough for being depended upon at other times when it suits the author's own purpose.

Thus, for example the following factual statements made by him have not been supported by any empirical evidence: (a) "the hired attached worker getting relatively more of his wage in kind than the casual labourers"; (b) "the growing replacement of hired attached labourers by casual labourers"; and (c) "the growing substitution of wage payment in kind by cash".

About wage variations in nearby villages and lack of labour mobility among such villages, Dasgupta writes: "such variations, while possible in the backward areas covered by the study, would be unthinkable in the areas with developed agriculture". I am afraid that Dasgupta will have to think the unthinkable if he would only carry out some investigations, say in the Gushkara area of the advanced district of Burdwan, as I have done and found an identical picture to the one presented by me in the study of mine quoted by him. One wonders what permits him to make such sweeping statements as the following without carrying out any investigations into the question: " ... the labourers do take into account the wages prevailing in other areas, certainly in the adjacent villages, when conducting wage negotiations". Dasgupta may wait patiently for the publication of a joint paper of mine with Pranab Bardhan where we present results about five different clusters of villages in five different districts, some backward and some advanced. Results do vary, and in one cluster we found almost perfect mobility of labourers and a uniform wage rate. But this is in Murshidabad, not a particularly advanced district. On the other hand, labour mobility is as highly restricted in the cluster from Burdwan as from the backward Jalpaiguri district. It seems to us that dissolution of this village isolation, which is undoubtedly taking place, is related to factors other than economic advance in conventional terms.

On the theoretical plane, I vehemently protest against his imputing to me "implicit acceptance that neo-classical tools can be used for understanding capitalist relations, either in agriculture or outside". He cannot point at anything in my writing that indicates such implicit acceptance and his imputation cannot but be regarded as malicious.

I find it amusing that he should suggest that on re-reading my own text I would be convinced that my data are "incompatible with the thesis of 'unfree' labour". It is much more mutually respectful to admit that there are differences in our understanding of the concept of 'unfree' labour. I entirely agree with him that "agricultural labourers in West Bengal today are 'less unfree' and 'more free' than they had been, say, twenty years ago". But all the same, in our judgment, they are not yet so free as to become *commodities*, the criterion of capitalist relations.

We also stick to our position that "agricultural labourers do not constitute a class for itself". This position is not contradicted by our own survey finding that wage rises in many villages have taken place as a result of group actions of various kinds. 'Group actions' cannot be taken to be the same as 'class actions'. We cannot conceive of the different groups of casual labourers in neighbouring villages as constituting so many different classes. If they indeed constituted a class they would be a single class with the consciousness of common class interests. If that were so, the labourers of a large number of villages in a large area will combine together with common demands in a struggle against all the employers of the region. This does happen sometimes, but very exceptionally. Obviously if there were such a level of class consciousness, there would be no question of labourers of one village preventing by force labourers of neighbouring villages from working in their village—a phenomenon that we have encountered very frequently and about which we have given figures in our paper. We have also given in those papers figures about villages where wage rises have taken place as a result of labourers' agitations. In most cases, these events were isolated and there were not even any ripples in the neighbouring villages.

Political parties who are working among agricultural labourers seem to find it opportune to go along with the labourers' group consciousness. We give a concrete instance of the extent to which this kind of opportunistic politicking may go. The cluster of five villages that we have called the 'Sian cluster' in our study are not only adjacent to each other but constitute a single complex of settlement with no visible demarcations. Even among such close villages wages were found to vary. As a part of our investigation, we asked selected labourers why they did not cross the invisible boundaries, so as to receive higher wages. One answer that we got from some labourers is as follows: "Party people have told us to remain within our own villages". So much for Left political parties working towards forming agricultural labourers into a class!

To rebut any of our positions, it certainly will not do for Biplab Dasgupta to merely make assertions and refer to dubious unnamed party documents. That may serve the purpose of propaganda meetings of his own party, but not that of scientific discourse. For the latter, Biplab Dasgupta has to produce results of surveys as scientifically conducted and therefore as dependable as those conducted by myself and cited by him ever so often in support of his own contentions. Despite this implicit acknowledgement of the quality of my investigations he cannot rise above the pettiness of referring to me in such language as ". . . academics with Left-wing pretensions . . ." Assuming that he is contrasting me with himself and such other academic economists who have put themselves at the service of the Left Front government and thus, presumably, qualified for Dasgupta to be "academics with Left-wing commitments", let us see the differences in the methods of study followed by the 'pretenders' and the 'committed ones'. My investigations have involved scientific methods of statistical theory. Their method has consisted of travelling extensively in the countryside and talking to their local party people and local government officials. My means of transportation has been the ramshackle overcrowded buses, where no seats can be reserved, and equally overcrowded second class train compartments (I refuse to travel first class while conducting surveys among the rural poor!) and I have had often to travel standing all the way. (Readers in other parts of the country may not have any idea about the abominable condition of transportation in the West Bengal countryside compared to which the transport systems of Punjab or Kerala would be so advanced as to recall the differences between developed and underdeveloped countries; and this has only worsened in the eight years of Left Front rule.) Dasgupta and his academic colleagues in the service of the government travel, as a matter of rule, in chauffeur-driven saloon cars. For spending nights, I had to depend on mofussil hotels and nobody who has not travelled in West Bengal countryside will know how miserable their conditions can be. Biplab Dasgupta and his friends can enjoy such luxurious accommodation as is provided by Circuit Houses and bungalows of the different Departments meant for touring government officials. Indeed, in contemporary West Bengal, academics with Leftist 'commitments' (meaning thereby support to the Front government) stand to gain ample rewards for their Leftism. For, whatever else the Left Front government may lack resources for, the Finance Minister has always more than enough funds for distributing perquisites and patronage amongst all those intellectuals who are prepared to lend their support to the regime. And in this one respect the state government has outdone the Central government.

# The Seventh Plan

IN what is apparently considered something of a minor triumph for the Planning Commission and for planning itself, the Prime Minister was persuaded to spare a little time to attend a meeting of the Commission on June 4, on the eve of his departure for Europe and the United States. The meeting formally decided that there would be no cut in the proposed public sector outlay in the Seventh Plan, that it would be retained at the level of Rs 1,80,000 crore set in the Approach to the Seventh Plan prepared last year. This need not have surprised anyone. The Prime Minister had told the recent meeting of the AICC, as part of his general assurance that his government was not deviating from what are regarded as the long accepted policies of the Congress, that there was no question of the Seventh Plan being reduced in size. Even so, correct form required that the decision be taken by the Planning Commission. This having been done, the Commission can now proceed to work on the prose of the Plan so that in due course a Draft Plan can be presented, once again in keeping with good form, to the National Development Council for its approval.

That this view of the purpose of the recent meeting of the Planning Commission is not unduly cynical is borne out by the official press note issued after the meeting which, apart from references to the Prime Minister's remarks at the meeting on the importance of monitoring the progress of Plan programmes and developing human resources, does not mention anything more than that the meeting had decided to retain the public sector outlay in the Plan at Rs 1,80,000 crore. Even on this very limited point the press note glosses over how the Planning Commission now considers a public sector outlay of this order feasible when only some months back it had informed a meeting of economists called by it that the resources likely to be available for financing the public sector Plan would fall short of the target of outlay by as much as Rs 40,000 crore. While some explanation is due from the Commission on this score, that is not, however, the central issue in regard to the Seventh Plan. For it is not at all difficult to make appropriate assumptions about any of the government's major sources of revenue—the current favourite seems to be the surpluses of public sector enterprises—to expand the figure of resources likely to be available to finance the public sector Plan. Further, thanks to inflation, fulfilling targets of financial outlay has never been a problem in any of the Five-Year Plans and the Seventh Plan need not be an exception. So a debate about the achievability of the target of public sector outlay set for the Seventh Plan would be rather pointless, though, one suspects, it would suit the government and the Planning Commission quite well.

Should not the questions about the Seventh Plan be of a more basic genre? The Five-Year Plans have been sought to be given the character of attempts at development of the national economy in the interests of the people as a whole. Thus the Approach to the Seventh Plan once again describes the strategy of the Plan as being "built around higher agricultural growth and creation of employment, improvement in efficiency and quality of production and technological upgradation in industry and infrastructure, the use of less capital-intensive and more labour-intensive techniques and shifts in investment priorities towards items of mass consumption and measures to improve the quality of life". These objectives, it is unnecessary to emphasise, presume rigorous social control over investment, production and other major economic decisions, whereas the actual trend in the government's economic policies has been in the opposite direction. The government has been in the process of relaxing and removing many of the controls and regulations which had been devised precisely to secure the sort of social control over economic decision-making in a largely private enterprise economy which the objectives of national planning had presumed. It must be said, of course, that the departure from these controls comes after it has been sufficiently demonstrated that they have not achieved—and, it is clear in retrospect, could not have been expected to achieve—the desired social control.

But the logic of this acknowledgment and the relaxation of the concerned regulations must to be extended to a recognition that the Five-Year Plans cannot achieve the objective of development of the national economy in the interests of the people. Consider, for instance, the objective of altering the pattern of investment and production in favour of items of mass consumption so that the level of living of the large majority of the people can be improved. The industrial licensing regulations have, it is true, failed to achieve this objective; what they have achieved in most cases is the creation of oligopolistic situations in industries producing goods of upper class consumption with concomittant shortages and monopoly profits, black money, political corruption and what have you. Now industrial licensing controls are being progressively relaxed, accompanied by suitable changes in the rates of direct and indirect taxes, for the explicit purpose of encouraging the production of goods and services which are demanded by the relatively small segment of the population in whose hands the bulk of incomes and purchasing power are concentrated. Or take again the objective of securing the use of less capital-intensive and more labour-intensive techniques. The controls on industry and other means of influencing the choice of techniques and technologies, it is true once again, have not been successful. And recent economic policy statements have explicitly spelt out that, in the pursuit of modernisation and the adoption of the latest technology, enlargement of employment cannot be an objective, at least as far as industrial sector is concerned. A specific expression of this approach is to be found in the new textile policy announced earlier this month in which large-scale displacement of labour has been accepted as both inevitable and necessary for the reorganisation of the industry on a more viable basis.

There has been some speculation that with these changes in economic policies, planning as we have known it has lost much of its rationale and that, therefore, a sort of plan holiday may be on the cards. It is true that the social objectives of planning, some of which have been referred to above, are likely to get even shorter shrift in the days to come than they have in the past, but precisely for that reason the need to formally and symbolically adhere to planning may be stronger from the point of view of the classes who are the real beneficiaries of planning. For them the Planning Commission and the Five-Year Plans serve the important function of clothing class-oriented development in the garb of development for the people. The appearance has to be kept up that the economic activity of the government is carried on in the interests of development of the national economy and for the betterment of the condition of the people. The need to sustain this appearance is the greater as the government's economic policies and the actual investment and production operations in the economy become more closely tailored to the profitability/calculations of businessmen and industrialists.

## *Textile Policy*

### Many Question Marks

LEFT entirely to itself, the Indian Cotton Mills' Federation which is concerned almost exclusively with championing the cause of the organised mill sector, could not possibly have formulated a textile policy that could serve its interests better than the one announced by the Union minister of state for textiles, Chandrashekhar Singh, on June 6, understandably enough therefore, the ICMF chief Kantikumar R Podar has hailed the policy as "progressive, pragmatic and futuristic" which should enable the industry "to enter the dawn of a new era". Indeed, the mill sector is being allowed operational freedom it has seldom enjoyed in the past—not over the past decades anyway. The policy has apparently been formulated against the background of chronic sickness in the organised mill sector.

Under the new dispensation mills can spin any fibre and weave any fabric, barring, of course, the items exclusively reserved for handlooms. The industry has been assured supply of requisite raw material—cotton as well as man-made fibre—in adequate quantity at reasonable prices. Fiscal levies on man-made fibres/yarns and on intermediates used as inputs for the manufacture of such fibres/yarns shall be progressively reduced in such manner as to facilitate absorption of increased domestic production so that the benefit flows to the consumers in the form of lower prices of fabrics.

The new textile policy seeks to restructure the industry with a longer term perspective by giving up the compartmentalised approach in terms of various sectors and viewing the industry in terms of stages of manufacture—spinning, weaving and processing. Handlooms are being assigned a distinct role and their growth and development are to be accorded high priority. Mills and powerlooms, which are now required to be registered compulsorily, shall be treated at par and shall have to compete on the basis of their inherent strength and capabilities.

Mills will be allowed to contract and expand capacity to achieve efficient production and economic viability. Potentially viable mills will be provided with a rehabilitation package to be supplemented with a financial package if need be. A nodal agency is to be designated to evolve and manage the package. A national level standing advisory committee on modernisation of the industry is to be set up to identify on a continuing basis the needs of modernisation and the type of modernisation the industry should adopt. It is also proposed to set up a concessional fund for modernisation. Units deemed non-viable will be allowed to close down provided "the interests of workers are protected". The funds needed for payment of retrenchment benefit to labour shall be part of the rehabilitation package and loans needed for such compensation shall be provided on concessional terms.

Elimination of irrelevant controls and structural rigidities and full flexibility in the use of fibres—man-made or cotton—should help increase the production of cloth of acceptable quality to meet the clothing needs of a growing population but it is difficult to say whether cloth prices would also be 'reasonable'. It is extremely doubtful whether the new policy will help achieve the other main objective, namely, augmenting the availability of cloth at affordable prices for the poorer sections of the population. The entire production of controlled cloth is to be transferred to the handloom sector by the end of the Seventh Plan. Handlooms cannot produce as efficiently or economically as mills/powerlooms and nor can they offer quality and finish which is readily acceptable to the common folk. That the cost of production can be subsidised is another matter.

On the government's own reckoning the present crisis of the industry is "neither cyclical nor temporary". But it is not rooted entirely in structural deficiencies as the new policy statement would have one believe. Many of the industry's ills are attributable to management inadequacies. Restructuring the industry, welcome as it is, cannot by itself ensure the natural growth of all the textile sectors in an orderly and integrated manner. The proposed structural reorganisation will no doubt help impart vigour to the ailing industry but much will depend on how expeditiously and efficiently this is carried out. The restructuring of the industry, rehabilitation of sick but potentially viable mills and closure of economically unviable units is certain to raise many formidable issues.

Because of the emergence of a large public sector in the textile industry as a result of the take-over of sick units, the government will soon be on trial. The National Textile Corporation has been incurring heavy losses year after year. Nearly a fifth of the 125 mills have been continuously losing and eight very heavily. It will be interesting to know how soon the government decides to close down the non-viable units and how the trade unions react to it. The rehabilitation fund for workers may not be able to meet the workers' demands and labour unrest may well have unpleasant political consequences. Implementation of the modernisation programme also is likely to raise many ticklish issues.

Not much need be read into the assurance held out in the new policy that cotton growers shall "always be assured offtake of their produce at remunerative prices" and that cotton needed by the industry "would be made available in adequate quantity and at reasonable prices". Reconciling conflicting interests of growers and mills is not all that easy. This is amply borne out by the manner in which the government has handled the cotton situtation this season. Cotton prices are on the decline and the three major state and co-operative marketing agencies—CCI and Maharashtra and Gujarat marketing federations—have strongly opposed the import of short and medium staple cotton as they are willing to meet fully the industry's requirements. Even so, New Delhi has permitted import of two lack bales of short-medium staple cotton, apparently under strong pressure from the powerful industry lobby. The various measures taken by the government so far have failed to correct the varietal imbalance, resulting essentially from the relative abundance of long and extra long staple cotton.

Considerable interest centres on the government's assurance in regard to progressive reduction in fiscal levies on manmade fibres/yarns and on the intermediates used as inputs for the production of such fibres/yarns. The reduction will have to be very steep indeed to bring synthetic and blended fabrics within the easy reach of the masses and check smuggling of synthetic fibres and fabrics which is known to have assumed disquieting proportions. The demand and supply position being what it is at present, it is highly unlikely that the industry will pass on the full benefit of reduction in fiscal levies on man-mad fibres/yarns to the consumers of fabrics.

The intentions behind the new textile policy are quite laudable. It is one thing to hold out assurances but quite another when it comes to translating them into concrete programmes of action and effective implementation of these programmes. Even if one were to take the view that Rajiv Gandhi's government is really earnest about pushing ahead with its policies and programmes, nothing can be taken for granted. The new textile policy seeks to do away with the compartmentalised approach in terms of different sectors. But the cloth production targets for the Seventh Plan have been fixed in terms of the three sectors: organised sector 4,500 million metres, powerloom sector 5,400 million metres and handloom sector 4,600 million metres. Different targets for mills and powerlooms accord ill with the new policy under which mills and powerlooms are to be treated at par and they have to compete on the basis of their inherent strength and capabilities.

## *Sri Lanka*

---

## The JVP and the Eelamites

---

*M S S Pandian writes:*

THE Janata Vimukhti Peramuna (JVP), the ultra-left Sri Lankan party which led the 1971 abortive armed insurrection in the island, has expressed its stance on the Tamil militants in its May Day resolution. The four page resolution characterises in no uncertain terms the Tamil militants as CIA agents trying to create a separate bourgeois state in the northern and eastern Sri Lanka. At the May Day rally, one of the JVP speakers compared the Tamil militant groups to the Nicaraguan Contras and indicated that all armed struggles need not be revolutionary in character.

Contrary to the claims of the JVP, there is no evidence so far to show that the Tamil militants are receiving support from the CIA. In fact they are supported by Libya and the PLO which are opposed to the US. Further, all the militant groups are unequivocal in condemning the economic and political involvement of the US in Sri Lanka. On the other hand, the present Sri Lankan government, which the militants are fighting against, is whole-heartedly pro-US. Apart from the fact that the present government is following an US-inspired open economy policy, one may cite several other instances in support of of this view.

First, in 1980, the UNP government threw open the Trincomalee port, one of the finest natural harbours in the world, to the warships of all countries if they were not carrying nuclear weapons. The ships of the US Seventh Fleet have called at Trincomalee very frequently and made maximum use of the new policy. A Pentagon map went to the extent of portraying Trincomalee as "one of the global facilities available to the US but not to the Soviets". Secondly, in 1981, the Sri Lankan government almost agreed to lease out the oil storage farm at Trincomalee to the Singapore-based Coastal (Bermuda) Ltd, a subsidiary of Coastal Corporation of America, to service commercial vessels in the Indian Ocean. The draft agreement had provisions for servicing US warships after getting clearance from Colombo. Local protests forced the government to scrap the agreement. Subsequently the oil farm was leased out to a consortium of three foreign companies, including the Coastal (Bermuda) Ltd, and the new agreement did not provide for servicing of US warships. On the new agreement, the Jaffna-based *Saturday Review* (April 14, 1984) rightly remarked, "what is there to prevent a tanker from Trincomalee going outside our [Sri Lankan] territorial waters and servicing US warships? Or even supplying oil to the Diego Garcia base?"

Thirdly, the Sri Lankan government has granted more than 1,000 acres of land near Chilan for a Voice of America (VOA) radio station, though an ordinary radio station does not require more than a few acres of land. According to the agreement which was concluded in December 1983,

**SUBSCRIPTION RATES**

**Inland**

| | | |
|---|---|---|
| Institutions | One year | Rs 250 |
| | Two years | Rs 475 |
| | Three years | Rs 700 |
| Individuals | One year | Rs 200 |
| | Two years | Rs 375 |
| | Three years | Rs 550 |

**Concessional Rates**

| | One year |
|---|---|
| Teachers/Researchers | Rs 150 |
| Students | Rs 100 |

Concessional rates are available only in India. To avail of concessional rates, certificate from relevant institution is essential.

**Foreign**

| | One Year |
|---|---|
| Surface mail (all countries) | US $ 50 |
| **Air mail** | |
| Bangladesh, Pakistan and Sri Lanka | US $ 50 |
| Other Asian countries | $ 65 |
| Africa, Australia, Europe | $ 75 |
| South and North America and New Zealand | $ 90 |

Remittance by money order/bank draft/postal order preferred. Please add Rs 7 to outstation cheques for collection charges.

All remittances to **Economic and Political Weekly**.

VOA will establish six transmitters with a total capacity of 2,500 KW. Moreover, the agreement permits the VOA "to install associated communication and operation facilities", the implications of which are still unknown.

Given this unquestioned loyalty of the Sri Lankan government to the US, the JVP's theory about Tamil militant groups does not stand the test of reason. It is well known that of late the JVP is trying to shed its previous identity of being committed to armed struggle and plunge into electoral politics in the island. Painting the Tamil militants as terrorists backed by the CIA is one way by which the JVP can communicate that it is no more interested in the path of armed struggle.

## *Nicaragua*

### Counter-Productive Embargo

THE US President's order of May 1, imposing a trade embargo on Nicaragua, declares a national emergency to deal with the "unusual and extraordinary threat" posed by "the policies and actions of the Government of Nicaragua" to "the national security and foreign policy of the United States".

What exactly have the Sandinistas done in recent days or weeks to provoke the US action? The US President's message to Congress hardly mentions anything concrete except (a) the Nicaraguan rejection of the US peace initiative asking Sandinistas to negotiate with the rebel forces, generally referred to as 'contras', if the US was to abstain from assisting the latter, and (b) the current visit of Nicaraguan President Ortega to the USSR. But practically everyone knows that the underlying purpose of "the hastily ordered" trade embargo was, as the *New York Times* has put it editorially, "to blot out Congress's embarrassing refusal to keep financing the CIA war" in Nicaragua.

The Administration officials themselves have been reported as justifying the trade embargo in terms of the need not only to send a strong signal to Nicaragua, Cuba and the Soviet Union but also to "put Congress on notice that the White House would continue to seek changes in Nicaragua, with or without Democratic backing". Regardless of how the US Congress in general and the Democrats in particular respond to the signal, which the President's order is thus meant to convey, it is difficult to see how the Nicaraguan response to the US trade embargo cannot but go counter to the US objectives.

Nicaraguan trade with the US has already declined from close to 50 per cent of its total trade in the late 1970s to less than 20 per cent. During this period, Nicaraguan trade with the Soviet bloc has gone up from about one per cent to 20 per cent and with Western Europe from 18 to 26 per cent. "The United States has", as the Nicaraguan Foreign Trade Minister, Martinez Cuenca, puts it, "become a market of last resort". In this context, it is well to remember that when the US slashed the Nicaraguan sugar quota by 90 per cent in May 1983, it was possible for Nicaragua to find alternative markets for its sugar in Iran, Algeria and Libya.

Nicaragua's exports to the United States consist principally of bananas, beef and shrimp but they are nowhere near the levels which once obtained. Nor is Nicaragua's dependence on the US for major imports now as critical as it possibly was some years back.

While the trade embargo is therefore unlikely to push Nicaragua to the brink of economic disaster, it will certainly create some immediate problems for that country, problems that might well "propel the regime to depend still more heavily on Soviet bloc aid" and trade, as the *New York Times* fears. So the danger clearly is that the US action will have exactly the opposite of the intended effect. It will also have been demonstrated to the world that the US leadership can resort to obviously counter-productive measures, if only to reassert its authority in the face of frustrating inability to have things its own way.

## BUSINESS

# Who Owns the Companies?

WHO owns the companies? The people, or almost, a study of the ownership pattern of shares of companies assisted by the Industrial Development Bank of India (IDBI) seems to say. In the sample of 447 companies with a capital of Rs 1,584 crore covered by the study, individuals were the single largest category of shareholders and accounted for 31 per cent of the total equity of the companies. Financial institutions came next with 24.7 per cent of the equity, followed by joint stock companies (22.8 per cent) and government and semi-government bodies (20.4 per cent). The sample consisted of 296 private sector companies, 68 joint sector companies and 83 public sector companies. In terms of the total capital of the sample companies, the shares of these three sectors were 56.5 per cent, 18.4 per cent and 25.1 per cent, respectively.

Individual shareholders accounted for 38.7 per cent of the equity of the private sector companies in the sample. Their share of the equity of joint sector companies was slightly lower at 35.5 per cent and, understandably, it was the lowest (10.3 per cent) in the case of public sector companies, in whose case 64.7 per cent of the equity was provided by government and semi-government bodies. The IDBI study points out that, interestingly enough, the share of individual holdings in MRTP companies at 37.3 per cent was considerably higher than in non-MRTP companies (26.8 per cent) and from this draws the conclusion that "this is perhaps indicative of the assets preference of individuals in favour of well established industrial houses". It would appear, however, that this conclusion needs to be modified if we consider only the private sector companies in respect of which the share of individual holdings is substantially higher in the case of non-MRTP companies (42.5 per cent) than in that of MRTP companies (36.5 per cent). The reverse, curiously enough, is true of the joint sector companies: here individual holdings account for a much higher proportion of the shareholding of MRTP companies (41.2 per cent) than that of non-MRTP companies (34.1 per cent). If any conclusion can at all be drawn from these figures, it may be that the association of government and semi-government bodies with and even their large shareholding in joint sector companies do not by themselves inspire much confidence among individual investors.

Among individual shareholders in the private sector companies in the sample, almost one-fifth were those described as 'persons engaged in household work'. These shareholders, it is reasonable to assume, were women, though there would have been more women shareholders in other categories of individual shareholders such as 'professionals and self-employed persons' and 'salaried persons'. Thus women, it would appear, are an important shareholding group in the Indian corporate sector. However, before any hurried conclusions are drawn from this about the position of women in society, it is as well to consider that very few, if any, of these women 'shareholders' would have had anything to do with the decision to invest in the shares and most might not be even aware of the details of the shares which stand nominally against their names in the share registers of companies.

It comes as no surprise that almost all individual shareholders came from urban areas and from urban occupations. The share of farmers in individual shareholdings in all the companies in the sample was just 7.5 per cent and this figure too was boosted by the efforts of promoters of joint sector units in the fertiliser industry to encourage farmers to purchase shares in these units. The IDBI study feels that the "message of industrial securities" can be spread in rural and semi-urban areas "by encouraging and building a good network of sub-brokers who command good standing in their respective areas and would, therefore, be the right persons to convince rural investors about the benefits of corporate securities". However, the study is not unaware of the dangers of such efforts as is seen from its warning that "while cultivating investors from rural and semi-rural areas adequate caution needs to be exercised and such investors should be encouraged to go in for only safe and profitable corporate securities . . .".

Financial institutions accounted for 24.7 per cent of the shareholding of all the companies in the IDBI sample. Their share in private sector companies was 27.3 per cent, in joint sector companies 28.5 per cent and in public sector companies 16.1 per cent. In the case of the financial institutions it can be said that they showed a distinct preference for MRTP companies and this was true of both private sector and joint sector companies. Their holding in MRTP companies in the private sector was 29.1 per cent and in MRTP companies in the joint sector 37.6 per cent—significantly higher than the proportions of their overall holdings in the two sectors.

The separate information provided for companies promoted by existing entrepreneurs and by new entrepreneurs shows that the financial institutions accounted for a larger proportion of the shareholding in the latter category of companies. But this was due entirely to the development finance institutions at the all-India and state levels. The state level financial institutions particularly had contributed as much as 24.1 per cent to the equity of new joint sector companies. On the other hand, the investment finance companies (LIC, GIC and UTI) had stuck faithfully to MRTP companies and to companies promoted by established entrepreneurs. Among private sector companies their share of the equity was 21.9 per cent in the case of MRTP companies and 8.4 per cent in the case of non-MRTP companies. Even more pronounced was their preference for companies promoted by established entrepreneurs: their share of the equity of these companies was 18.1 per cent compared to a mere 3.2 per cent of that of companies promoted by new entrepreneurs.

The information on the manner of acquisition of equity by the financial institutions once again confirms that the hue and cry about the so-called convertibility clause was vastly exaggerated. Only 7.3 per cent of the total equity holdings of the financial institutions in the sample companies had been acquired through conversion of loan to equity. Even if only the IDBI, ICICI and IFCI are considered, less than 10 per cent of their equity holding in the sample companies had been acquired through conversion.

Inter-corporate investment continues to be the standard means of retaining and exercising corporate control. In the private sector companies in the sample, among the large shareholdings (defined as holdings in excess of Rs 50,000) which are what are relevant for control, inter-corporate investment accounted for as much as 41.3 per cent and, if the holdings of the financial institutions are excluded, for nearly two-thirds. Who then owns the companies, after all?

## *Electronic Components*

### No Growth Strategy Still

THE new electronics policy announced in March this year has set an ambitious production target of Rs 10,000 crore worth of electronic goods for the year 1989-90 as against the estimated production of Rs 2,165 crore in 1984-85. This will call for creating a strong base for the electronic component industry. For achieving the targeted level of output worth Rs 10,000 crore by the electronics industry, the value of production by the component industry will have to increase to at least Rs 2,000 crore in 1989-90 from the present level of about Rs 310 crore.

With a view to providing a boost to the growth of the component industry, it has been delicensed vide a press note issued by the Ministry of Industry and Company Affairs on March 16. The government has also decided to de-reserve some of the components which are at present reserved for the small-scale sector since these are required to be produced in large volume. Normally, manufacture of components is not permitted from intermediate stages. However, in the case of bipolar, linear and digital integrated circuits requiring heavy investments, the units will be permitted to assemble the items from the intermediate stages to begin with provided they make an initial investment of at least Rs 5 crore.

The Electronic Component Industries Association (ELCINA) is of the view that given the present state of the industry, achieving a six-fold growth over the next five years so as to achieve the target of producing Rs 2,000 crore worth of components by 1989-90 will be a difficult task. According to ELCINA, it is also difficult to visualise production of components in the country at international prices during the Seventh Plan period.

Referring to the government's proposal to reduce gradually the import duty on components to 25 per cent by the end of the Seventh Plan, the association has expressed the view that it will seriously affect the domestic component industry. It has pointed out that the recent reduction of customs duty on components to 75 per cent has already put the domestic producers of components under a serious financial strain. It feels that the component manufacturers have to follow irksome rules and procedures to avail of the facility of importing the raw materials required by them at concessional rates of duty. This, according to the association, is in contrast to the situation facing the equipment industry which is not governed by such procedures.

ELCINA has cautioned that any long-term policy of import-led growth for the electronics equipment industry will not succeed and measures will have to be initiated to ensure that the domestic component industry grows at the rate of 45 per cent per annum over the next five years. However, according to the assessment made by the Department of Electronics (DOE), it may not grow by more than 35 per cent per annum.

According to the report of the Seventh Plan working group on electronics set up by the Planning Commission, the investment requirement of the components industry during the Plan is about Rs 800 crore. The working group feels that to encourage this magnitude of investment, the rate of interest on loans advanced to entrepreneurs setting up units for the manufacture of components will have to be brought down by about 5 per cent to 8 to 9 per cent. It feels that the interest subsidy should be made available for a period of five years from the date of disbursement of the first instalment of the loan.

With a view to implementing this suggestion, the Department of Electronics is expected to make a fresh bid to create a

Rs 75 crore Electronic Component Development Fund (ECDF) to provide concessional credit to the component industry. The idea was originally mooted at a seminar organised by ELCINA in February 1983. It was subsequently supported by the Planning Commission working group.

Unfortunately, the latest annual report of the Department of Electronics for 1984-85 has not spelt out any strategy for the growth of the components sector. In view of the ambitious Seventh Plan target fixed for the electronics industry, there is an imperative need to formulate a detailed strategy for the development of the component sector on sound lines.

---

## LETTER TO EDITOR

# Ahmedabad Riots

"AHMEDABAD has not seen a worse week" is how Sujata Patel begins her article titled "Collapse of Government" (April 27). Neither has Ahmedabad seen such an armchair report on the issue of reservation. The report in part is factually incorrect, incomplete, misleading, formulistic and ignorant of the social forces at play. Sujata Patel is like a mythical Sanjaya narrating the Mahabharata war to the blind king Dhritrashtra far away from the battle field. In this case, it seems, the waves carrying information from riot-hit areas like "Asodia, Gomtipur, Rakhial", travelled to your correspondent. Albeit they got distorted before reaching her.

(i) Let us first look at her factually incorrect reporting. On page 749 she writes, "ultimately a rumour about the lynching of a police constable by a mob led to a section of the police leading a revolt". That was not at all a 'rumour'. A police constable by the name of Laxmanbhai Desai was in fact stabbed to death in Khadia. The poor fellow was escorting an enquiry committee appointed by the High Court to gather information on the alleged police excesses.

During the whole agitation rumours ran amock—rumours let loose by the people and the press. Rumours were turned into reality by some and reality was turned into rumours by others like Sujata Patel.

(ii) Her report is misleading on several counts. All the while in her article when she sheds crocodile tears over so-called police excesses, she conveniently forgets to mention even a word about the communal carnage at Bapunagar which left 15 dead, around 50 injured, about 40 missing and 400 houses burnt. It was by far the worst affected area anywhere in Gujarat. It was not just police inaction but direct involvement of four police officers in connivance with caste Hindus and Congress(I) local leaders who also happen to be professional union-breakers which led to an orgy of killing and burning in the Muslim neighbourhood for nearly 20 hours from April 21 afternoon to April 22 morning. Actually the title of the article would have been more apt for what happened in Bapunagar, had she but mentioned it.

But it is not accidental that she forgets to write a word about Bapunagar. Nor did any newspaper in Ahmedabad including *Gujarat Samachar* for which her heart pours out so much on page 749. "Police mob burnt the offices of the newspaper that had exposed their excesses ..." Following are a few of the police excesses reported by *Gujarat Samachar* in front page headlines with concocted photographs and equally provocative captions. (Some of these false reports went a long way in worsening the already tense situation.)

Khadia: A few determined police officers did break open a house to nab a band of well trained rioters—of the BJP variety. Much hue and cry was raised over this by the middle class but high caste residents of Khadia with the help of ever obliging *Gujarat Samachar* blowing up the incident as another "police excess".

Gomtipur: *Gujarat Samachar* reported a naked police parade which was not witnessed by a single soul in the area. It carried photographs of "molestation of women". But the fact is that the women who had posed as the victims were immediately identified by the young men of the area as women of easy virtue.

*Gujarat Samachar* was thus not burnt for "exposing police excesses" as Sujata Patel would want us to believe but for its own excesses of malicious reporting. It is a known fact that the owner-cum-editor of *Gujarat Samachar* has a personal axe to grind against the Congaress(I) and Madhavsinh Solanki.

(iii) The point that Sujata Patel's article has missed is that the middle class but upper caste Hindus were infuriated because of the role of the state as an equaliser. The treatment that was so far meted out to the minorities, tribals, dalits and workers by police was this time also extended to a very tiny section of the middle class/caste Hindus. It was this anger which was reflected out of all proportions in *Gujarat Samachar*.

(iv) The formulistic approach towards the analysis of the agitation is glaring when she writes on page 750: " ... and the agitation shifted to working class localities where upper castes but lower classes live together with lower castes". In itself this statement might be true but the fact is that in all the working class localities the caste Hindus live in pucca multi-storeyed houses surrounded by the jhuggies of dalits or Muslims. One just has to throw burning rags or stones from the height of these multi-storeyed houses Force of gravity will do the rest. No amount of heroic determination on the part of the lower castes and Muslims can defeat this advantage. To illustrate our point better, on one of our visits to Jogeshwari chawl in Asarwa which is a small dalit locality surrounded by caste Hindu housing societies, we saw a pulley on the terrace of one of the houses fitted to transport stones. Laws of mechanics were at the service of "meritorious and efficient" caste Hindus. Our departure from the chawl was greeted by a flurry of stones from the caste Hindus in the presence of policemen. The arrogance of the caste Hindus would have sent shivers along the spinal cord of armchair correspondents.

(v) Sujata Patel reveals her ignorance of the spontaneous realignment of social forces taking shape during this agitation. On page 750 she writes, "in this case the use of police by Congress(I) for political gains has ultimately led to caste and communal clashes and for this the government has to accept responsibility". Police atrocities and excesses may aggravate a situation but in fact the clashes were the direct outcome of the anti-reservation stir. The communal clashes were the result of terrorising the Muslims in order to warn them not to be on the side of the backward and scheduled castes. Muslim shopkeepers, throughout the agitation refused to down their shutters in response to the bandh calls given by the anti-reservationists. In a flight of her imagination Sujata Patel divided Muslims from backward and scheduled castes and, not content with that, she also saw divisiveness amongst themselves. "The victims of the riots, both lower caste Hindus and Muslims, are in a vulnerable situation. They have solidarity neither with the backward caste nor within themselves." In comparison to 1981 the unity between these groups have anything but hardened.

NIMESH SHETH
NEERAV PATEL
ROOPA MEHTA

Ahmedabad.

# Government at Siesta

**Romesh Thapar**

NOTHING really makes political sense these days. We seem to be carrying on without a coherent government. As for details about those who are supposedly involved with decision-making, rumours hold the stage. In fact, no one really knows who is concerned We keep hearing about this or that initiative. The materialisation is zero.

Maybe, we are not understanding the real thrust of this generational change. The present still represents a massive public relations phase to reassure us that, dynastic politics notwithstanding, we have been blessed with a remarkably clean, sensitive 'leader' who is learning fast and will begin the action any day now. The Budget? Textiles? Loose ends galore.

Well, we will at least have to wait until Rajiv Gandhi returns from his foreign touring. The cynicism is so thick that you could cut it with the sort of blunt, indigenous, lowest-tender knives they use in five-star hotels of the ITDC type. Yes, he's gone to a 'mela', they say. Isn't that what they call this festivalising? And just when the country is exploding here and there, they say.

The public relations is bad, very bad. Why should the PM's visitation of the West be linked to *melas* of all things, and the 'dirt' associated with them? He is on a critical assignment to change US thinking on India. It will not amount to much admittedly, but it will, it is expected, open the way to sizeable extra aid and an entry into military purchasing *via* the Pentagon network. We will then rub shoulders, as it were, with neighbouring Pakistan. Boring, but that is the focus of the tour.

However, the excitement and euphoria in western diplomatic circles is matched by the undercurrent of amusement in the coterie around the Soviet Union's Gorbachev. The Rajiv Gandhi call on Moscow was ritual, despite the red-carpeting, the 'breaking' of protocol, the exchange of flowers during private walks, and the escorting of Sonia Gandhi by Raisa Gorbachev, but it confirmed earlier alignments. Whoever suggested that it would be otherwise?

With all their feverish looking around for revealing information, it is a wonder that the superpowers haven't yet discovered that India's real interest is to develop the European connection—and, for that matter, the Japanese. Mitterand's France is still doggedly consolidating its toe-hold on the sub-continent. It's no simple mirage. And there is the new interest in Italian military hardware!

This is as it should be. We cannot put all our eggs into a single basket, or even two, if the insistence is strong. Diversification in supply points is the slogan of the new era. It supposedly helps lift the old inhibitions, even returns us to some sovereign thinking in the foreign office. But don't expect 'instant' results. Our bureaucracies are skilled in meandering, and could go on skating here and there for some time—at least until thinking in high places develops some focus, and perspectives.

If the current handling of Assam, Kashmir, Punjab, Gujarat and Maharashtra are indicative of our capacities, we are in for a long and tedious wait during which anything could happen. We seem to be passing through extraordinary confusion. Major internal problems are getting inextricably mixed up in our foreign policy play—and are so treated.

Any non-Congress eruption is sought to be treated as if those involved are foreigners. It's rather difficult to indulge in this somersault on Gujarat and Maharashtra. Hence, the variations. But inept political management, bereft of democratic norms and good manners, can recoil and spark those angers which make the Congress culture even more oriented towards the backward, Hindi-speaking heartlands of the Indo-Gangetic region.

Normally, we should not be disturbed by Rajiv Gandhi's absence from India until June 18. We are large enough, and talented enough, not to miss his benign, meditative presence. But when this subcontinent of 750 millions continues to be run from a single office in New Delhi, it is cause for worry. We don't even know who is in command at the moment, nor does anyone else in the power hierarchy. Or is there somethng we don't know?

Mind you, these summer months in the North were not designed for anything but long siestas. Our rulers are grateful. They don't immediately have to show visible results. But some of us are fearful. Rulership is normally through a party machine or a rabble. Here, the most noticeable feature of the situation is that the ruling political formation drifts rudderless.

Some argue that there is a grievous lack of accessibility to the leader. He is hidden beyond endless cordons of security. Others reveal that he has no grip over the rapscallion MPs and MLAs who can unmake him when the time is propitious and the voting public can digest an ouster.

The truth will take ages to emerge. We are not Gorbachevs and Reagans, prepared to say anything while seizing every stratagem to consolidate their power in South Asia. We will settle issues with them, but only when our disarray is brought under some control. The propaganda and misreporting of the media cannot sell us the notion that all is tickety-boo. We know that a heightening of the disarray in our federal polity could bring the whole democratic edifice down, and suddenly.

India, is left with her age and wisdom to devise some kind of stabilising force to neutralise terrorism, reservationism, regionalism and communalism, to break corruption, black marketing and criminalisation, and to end police brutalities, bureaucratic harassments and lawless law-making. This correction cannot crystallise from the confabulations of a tiny coterie enjoying the blessed presence of the PM. It will only gather power from a wider consultation, at the level of a consultatation between equals. We have the wherewithal, as it is called, in this country. Or have we blinded ourselves to this too?

What, then, is holding us up? A national campaign will have to be led along these lines or else we are likely to stagger from crisis to crisis. The failure of the system can be seen at every level.

# Clearing the Decks for Growth

### Hansavivek

*STANDARD MILLS COMPANY's* management structure is being reorganised. It has been decided that it should be a board managed company and the day to day affairs of various divisions be entrusted to the president of each division. Accordingly, Rasesh N Mafatlal has resigned from the office of Managing Director. He will, however, continue to be the Chairman of the board. V Ramdurai and C C Maniar have resigned as whole-time directors and are being employed as executives designated as presidents of the chemicals and textiles division, respectively. Yogindra N Mafatlal resigned as a director from June 11, 1984 and Pradeep R Mafatlal was appointed as a director in the casual vacancy caused by his resignation. Jayantilal D Vasa resigned as a director and Madhav L Apte was appointed in the casual vacancy so caused. In pursuance of a special resolution approved by the members in 1980, the company has been paying commission upto one per cent of the net profits to the directors other than Managing Director and the two whole-time directors. Taking into consideration the contemplated board managed nature of the company's management, it would be permissible to pay as remuneration an amount of three per cent of the net profits to the directors.

The company has got a letter of intent for setting up a cement project with an annual capacity of 10.40 lakh tonnes in Raipur district of MP. The geological survey and prospecting of the site is being undertaken to ascertain whether the right quality and quantity of limestone is available in the project area.

The company has turned in improved working results for 1984. Net sales have amounted to Rs 125.36 crore as against Rs 132.34 crore in the preceding 18-month period, but gross profit has increased from Rs 5.23 crore to Rs 6.20 crore. These figures show a significant improvement in margins. After depreciation, net profit has more than quadrupled to Rs 219 lakh (Rs 51 lakh). There is no tax liability in both the years. Dividend raised by 2 points to 12 per cent is covered 1.81 times even though 2 lakh new equity shares allotted on conversion of partly convertible bonds participate in the dividend distribution for half the year. Nearly half of last year's lower dividend payment was short-earned.

* 18 months.

The textiles division had to contend with disturbing trends. Hardly had the Bombay textile industry recovered from the after effects of the strike, it was saddled with chronic problems of surging costs and depression in the textile market. Accumulation of stocks adversely affected liquidity, and extended credit had to be allowed for marketing of goods. Unchecked proliferation of power looms, with their distinct competitive edge on account of very low labour costs and overheads, continued to pose a threat to the organised mill sector. Export sales amounted to Rs 513 lakh against Rs 463 lakh during 1982-83. As a part of the modernisation programme, 20 Sulzer looms were installed, making a total of 104 such looms. Additions and replacement of plant and machinery, etc amounted to Rs 4.73 crore. Research and development efforts are directed towards standardisation of dyeing recipes on polyester blends by use of computerised colour matching equipment. Cost and energy saving practices are also being implemented on the basis of scientific studies.

The chemicals division experienced a squeeze on margins due to steep increase in power costs and the sagging market. By the end of the year, market conditions stabilised and the plant continued to operate at 70 per cent of the installed capacity. All steps have been completed to bring down power consumption in one of the plants. This has resulted in saving of about 400 units of power per tonne of caustic soda. Efforts are in progress to study various alternatives for power saving in the Uhde plant. Additions and replacements of plant and machinery, etc, in the division amounted to Rs 1.88 crore. The R and D wing completed the plant for the manufacture of 1.1.1 trichloroethane (methyl chloroform) and trial production has commenced. The quality of the product has been approved by the consumers. A plant for the manufacture of sebacic acid and its esters based on castor oil has been visualised and the company has applied for a licence for the manufacture of sebacic acid. Meanwhile, the product made in the laboratory has been approved by consumers abroad. Negotiations are afoot with BARC for licensing the technology for manufacture of sulphur hexafluoride. Agreements for the technology transfer from BARC has been signed. The company's joint venture in Indonesia, P T The Standard Mills Industries Indonesia, has started trial production of cots and aprons for the spinning industry and industrial rubber rollers. Full production is expected to commence in the near future.

*ANIL STARCH PRODUCTS* has fared so well during 1984 that the board of directors has stepped up dividend by three points to 18 per cent which is well covered by earnings. Although net sales increased only modestly from the previous year's Rs 22.65 crore to Rs 23.49 crore, gross profit has nearly doubled, reflecting an impressive rise in profit margins. Net profit is also higher at Rs 127 lakh against Rs 58 lakh and the enhanced distribution is covered 5.77 times as against 3.05 times previously. With a view to reflect the actual cost of fixed assets, the company decided to capitalise the interest on term loans/debentures raised to finance the fixed assets for the entire contracted period of such borrowings availed of during the year. Prices of maize and tapioca declined during the year on account of good monsoon. This helped the company to contain the cost of production. Prices have remained stable even during the current year. But there had been an exorbitant increase in the price of sulphur from Rs 1,284 per tonne in December 1983 to Rs 2,408 per tonne in January 1985. Moreover, the quality of some of the consignments was very poor, which adversely affected the efficiency of the plant and yields, and also resulted in frequent shutdowns and high maintenance costs. The cost of rock phosphate was higher by about 15 per cent as compared to the previous year. Besides, there was an increase in the cost of sulphuric acid. Accordingly, the cost of superphosphate increased.

There has been an improvement in the overall power supply position, but the average cost of power per KWH has risen from Re 0.77 in 1983 to Re 0.90 in 1984. As a power intensive industry, the company had to contend with this substantial increase in cost. Prices of coal were also increased by 30 per cent from January 1984. There has been no improvement in the quality of coal which contains considerable amount of moisture and ash. Besides, heavy transit shortages are also experienced. The imposition of a 10 per cent surcharge on freight in the Railway Budget for 1985-86 and heavy imposts on crude petroleum will further increase the already high costs of coal and electricity. The organised textile industry continued to pass through one of the worst crises yet encountered. This resulted in closure of about 67 mills. In Ahmedabad alone 17 mills have closed down. This has not only affected the demand for starches but is posing serious problems for the recovery of debts. In spite of adverse and highly competitive market conditions, the company has been able to sustain its sales on account of its well established reputation for quality products. The directors say that demand recession and highly competitive conditions prevail for starches and glucose. Markets for other processed foods and for sulphuric acid have improved. The demand for superphosphate throughout 1984 was very sluggish and, in spite of best efforts, the company was not able to step up sales. As a result, there has been a heavy accumulation of stocks. The demand is now picking up and concentrated marketing efforts are being made to increase the sales. The forgings division continued to suffer because of a demand recession and inordinate delays in payments by major customers, forcing the division to curtail its production. The sulphuric acid and sorbitol plants have been commissioned with the new improved technology. Both the plants are working at rated capacities. The sulphuric acid plant at Bhavnagar is being modified to achieve the emission standards with a view to arresting air pollution. The modification is expected to be completed by mid-1985. The average dearness allowance increased from Rs 606 in 1983 to Rs 658 in 1984. As a result, the wage bill increased substantially. The Industrial Court gave its award on demands of workmen of the Bhavnagar factory, raising wages from April 1, 1983. The workmen, being not satisfied, have moved the High Court of Gujarat. The industrial relations continued to be harmonious. Shantanu N Desai has been appointed as a director by the board to fill the casual vacancy caused by the resignation of B K Daphtary. In order to provide relief to the preference shareholders, the directors have decided to cancel the existing low yielding preference shares and issue instead to the preference shareholders redeemable secured non-convertible debentures bearing interest at 13.5 per cent per annum.

*PHILLIPS CARBON BLACK* has turned in poor working results for the year ended November 1984 despite higher production and sales. The directors attribute this outcome to the surplus installed capacity in the carbon black industry. There are now seven carbon black plants in the country with an annual licensed capacity of 1,55,000 tonnes and can produce 1,94,000 tonnes in a year. The current demand is around 90,000 tonnes and all plants are therefore operating well below capacity. Letters of intent for new plants for another 27,000 tonnes capacity are being converted into licences. According to the company's management, demand even in 1990 is not likely to exceed 1,30,000 tonnes. It strongly urges the government not to consider issue of any further licences. During 1983-84, the company produced 29,213 tonnes against 23,497 tonnes in the previous year and the licensed capacity of 36,000 tonnes. Sales volume too increased from 25,708 tonnes to 28,702 tonnes and sales realisation from Rs 33.48 crore to Rs 38.03 crore, but gross profit fell from Rs 4.11 crore to Rs 2.89 crore, reflecting the impact of erosion of margins. Saving in taxation has helped to narrow the gap and net profit is Rs 1.22 crore against Rs 1.38 crore. Dividend has been slashed from 25 per cent to 15 per cent. In addition a two per cent payment is recommended by the board in commemoration of the company's silver jubilee. Distribution is covered 1.37 times by earnings as against 1.45 times previously.

The company has not been able to export any quantity, as international prices would not even cover the cost of feedstock. Although feedstock prices did not change, the cost of feedstock per unit of carbon black went up substantially, mainly because of the limited availability of phenol extract, a higher yielding feedstock, and the necessity to purchase larger quantities of CBFS-72, a lower yielding feedstock. Petroleum feedstock prices continue to be far higher than international prices for much better quality material. Considering the difficult times faced by the automobile tyre industry, the company did not increase its selling prices and the major customers expressed their appreciation of this restraint. The company, however, has increased its selling prices in the current year consequent upon the prices of the raw material having been substantially raised by Indian Oil Corporation. In order to augment its long-term resources for meeting working capital requirements, the company proposes to issue 15 per cent secured non-convertible debentures upto Rs four crore to financial institutions and by private placement. The company has revalued its fixed assets to bring them in line with current costs and the surplus of Rs 10.11 crore has been credited to Revaluation Reserve Account.

**NEW DELHI**

# Seventh Plan: Going through the Motions

### BM

THE planners in Yojana Bhavan expect to finish writing the draft of the Seventh Five-Year Plan by end July or early August and to present it to the Union Cabinet thereafter. According to this time-table, the National Development Council will be convened to consider the draft Plan in September. This has been possible because the planners were able to persuade the Prime Minister to hold a meeting of the full Planning Commission to determine the overall size of the Plan before leaving for his foreign tour with which he was evidently very much preoccupied. Earlier the Prime Minister had twice postponed the scheduled meeting of the Planning Commission because of more pressing preoccupations. Development planning cannot after all have a very high priority on the Prime Minister's agenda when liberalisation of the economy, so as to give private enterprise and market forces freer play, is the credo. However, the making of a development plan has its own uses and there is no question, at least as yet, of formally abandoning planning.

It was no surprise when, at the end of the meeting of the full Planning Commission over which the Prime Minister presided, it was announced that the Rs 180,000 crore outlay for the public sector, as originally stipulated in the Approach Paper adopted last year under the direction of the late Prime Minister, Indira Gandhi, had been approved. The announcement was made through a brief press note. It was not considered convenient to give the press more details at a press conference as has been customary in the past. The planners were evidently not ready to face awkward questions.

The Prime Minister had told the recently held AICC(I) session that there would be no cut in the size of the Plan. This was part of the famous leftward lurch staged at the session. The planners too had been told to work on that basis. The decision on the size of the Plan has been quite frankly a political one. The planners have also been told that they would have to project a respectable rate of growth of the economy for the Seventh Plan. This too is considered politically essential. The political directive is that the growth rate to be projected for the Seventh Plan should be close to the 5.5 per cent per annum which is claimed to have been achieved in the Sixth Plan. The planners have formally opted for a growth rate of 5 per cent in the Seventh Plan for which an outlay of Rs 320,000 crore—Rs 180,000 crore in the public sector and Rs 140,000 crore in the private sector—is estimated to be required.

It is not known how the gap in resources which was earlier estimated to be as large as Rs 40,000 crore for the public sector part of the Plan has been or is proposed to be filled. Some smart exercises have been undertaken to show that the gap may be reduced to Rs 11,000 crore by assuming better tax compliance and better returns from public sector undertakings through improved efficiency and productivity in the Central and State sectors. These optimistic assumptions too would appear to have been made primarily on grounds of political expediency. What is their relevance to the reality on the ground is a different matter altogether. In any case, even if there are large lags and shortfalls in the implementation of the Plan, that will not be anything new. There was no point, therefore, in being squeamish about making optimistic assumptions at the stage of drafting the Plan. 'Sights must be set high' has been a good watchword for planning in the past and must not be discarded!

But even the most cursory enquiries reveal that the assumptions which have been made to prepare a politically respectable Plan have given cause for many misgivings among the planners themselves. The Finance Minister is reported to have asked in the meeting of the full Commission whether the resources assumed for the Plan would hold good in the face of the needs of security and the demands of the Defence Ministry. The query was evidently addressed to the Defence Minister who is a Member of the Commission and was present at the meeting. He is reported to have responded by pointing to the need to improve pay and perks in the armed forces which would require more money. Though the question of larger provisions for the para-military and police forces did not apparently attract attention at the meeting, the need under this head is also large. The Planning Commission in any case is precluded from having any say on defence expenditure and expenditure on internal security and law and order.

In the resources scheme for the Plan as now drawn up, it appears that the planners feel they are on far firmer ground about the position of the states than that of the Centre. While a scheme for eliminating the state's overdrafts on the Reserve Bank has been set in motion, the revenue deficit of the Centre remains an intractable problem. There is no way by which the revenue deficit of nearly Rs 6,000 crore in the Central Budget for the current year can be considered acceptable. The overall Budget deficit of the Centre is expected to grow to Rs 5,000 crore compared to the Budget estimate of Rs 3,400 crore.

The problem, according to the planners in Yojana Bhavan, is that 1984-85 was a very bad year so far as fiscal and financial management was concerned. The election-eve Budget of the Union government last year and the reckless spending spree during the year have caused much damage. There was, in these conditions, no alternative but to make a very modest start in the implementation of the Seventh Plan in its first year. But this will have repercussions for the Plan in the coming four years.

It is in this context that the planners look upon the Budget for the current year, especially its feeble resource mobilisation effort for development, with misgivings. They have no option but to go along with the politically preferred fiscal philosophy embodied in the Budget and the concessions given in direct taxes on personal incomes and profits of corporations. The Finance Ministry's claim that the losses in revenue on this account will be made up by better tax compliance is taken with a pinch of salt in Yojana Bhavan.

The planners are in no position, however, to challenge the facile claims and assumptions of the Finance Ministry. They have to take a wait and watch stance. They have raised in a general way the issue of improving the ratio of tax receipts to incremental incomes, especially in the area of direct taxes under the auspices of the Union government. They do not find any scope for further lowering of the rates of direct and indirect taxes during the rest of the Seventh Plan period if serious erosion of the resources assumed to be available for development is to be avoided. But they will leave it to the Finance Ministry to demonstrate in practice its ability to make up the loss of revenue from cuts in rates of taxes by improving tax compliance and tax administration. If the Finance Ministry fails to make good its promises on this score, which is most likely, the planners may be expected to cry a halt to the so-called liberalising philosophy of the current year's Budget in the area of fiscal policy. As matters stand, it is easy to see that relations between the Finance Ministry and the planners are rather cool. This is not a very good augury for making a Plan, much less for implementing it.

Another area of anxiety for the planners is export performance which is far from adequate to sustain the import liberalisation policy without getting into serious balance of payments difficulties. The growth of exports in volume terms has been only two per cent during the Sixth Plan. The problem can only worsen, if, in addition to liberal imports in the name of securing high tech inputs for upgrading domestic production capacities, there are imports, as for instance in the case of sugar, for augmenting supplies for current consumption in the name of holding the price line and easing inflationary pressures. The planners have considered it wise that the level of foreign financing of the Seventh Plan should be modest. Even so, it is proposed to be 10 per cent of the Plan outlay which will be higher than that in the Sixth Plan which was seven per cent. However, considering what is euphemistically called deterioration in the climate for foreign aid flows and the rising cost of servicing foreign credit, even the modest level of foreign financing proposed for the Seventh Plan will involve onerous repayment liabilities. In the absence of any visible signs of a breakthrough in exports, the viability of the policy of import liberalisation is bound to remain in question. In this context Yojana Bhavan circles are intrigued that the Prime Minister has not so far found suitable Cabinet Ministers to take charge of even such important ministries as Commerce and Industry. They are also worried about the dragging of feet on the question of improving the management structures of public sector enterprises which continue to suffer from bureaucratic and political interference. The fact indeed appears to be that except for a few enthusiasts of liberalising, the Planning Commission as such is not that close to the economic policy preferences of the government. Nor does it enjoy the confidence of the political authority as is necessary for making the Commission's advice effective and its work purposeful. While, therefore, the Seventh Plan will be prepared with all the usual frills and pretensions, the planners themselves seem to be uncertain about the direction of the government's economic policies.

The planners have, it would appear, tried in a circumspect way to caution the government against impetuosity in economic policy and management. The estimate of the saving rate which in the Approach Paper had been pitched as high as 26 per cent, which would imply an incremental rate as high as 30 per cent, has been revised downwards. The savings rate which is now estimated to be achieved in the Seventh Plan is 22/23 per cent with the incremental rate expected to be about 25 per cent. A more realistic capital-output ratio is also proposed to be assumed, which shows that the planners are rather skeptical about expectations of dramatic improvements in productivity and efficiency. On the contrary, it is pointed out, the improvement in the capital-output ratio observed in the Sixth Plan period, which came about because of the spurt in agriculture and in oil production, cannot persist in the Seventh Plan. The Planning Commission is also cautioning against too much centralisation of development responsibilities in such areas as education, health and rural development. More dispersed and decentralised activity with responsibility vested mainly at the level of the state governments is favoured. But the strong, almost-reckless, urge of the political leadership at the helm of the Central government for showing dramatic achievements has resulted in sharply tilting the financial allocations under the Plan in favour of the Centre. The states are to be allocated only Rs 80,000 crore and the rest of the Plan outlay of Rs 180,000 crore is reserved for the Union government. This will be a major issue of dispute when the National Development Council considers the Plan.

In spite of the enlarged role assumed by the Centre, the inevitable dissatisfaction among Central ministries over the sectoral allocation of resources remains. There has been a sharp cut in allocation in particular under the head 'Industry and Minerals'. The allocation is only Rs 24,000 crore as against Rs 19,000 crore in the Sixth Plan. The fact is that no major new start in this sector is planned in the Seventh Plan. This will amount to a sharp deceleration of the rate of growth of investment in public sector industrial enterprises with all its implications. The idea obviously is that the private sector will take up these areas with its vaunted efficiency. This after all is what liberalisation is really all about. But will the private sector be able to come up to these expectations about its enlarged role in industrial development?

The energy sector gets the largest allocation of about Rs 50,000 crore, with power development being allocated Rs 30,000 crore. Irrigation gets Rs 17,000 crore and agriculture, including rural development, Rs 9,000 crore. Social services are allocated Rs 30,000 crore. The Centre has been allowed a larger say in the implementation of programmes in sectors ranging from power to education in which the states have hitherto played the leading role.

## BIHAR

# Teaching the Santhals a Lesson

### Umesh Sinha

THE small town of Sahabganj, headquarters of the district of the same name, was humming with activity as usual. But just 15 km away amidst the forests and hillocks of the Rajmhala hill range, an eerie silence had gripped the adivasi village of Banjhi. In this village a week ago 15 Santhals had been killed and many injured by the police. Since then the village has been cut off from the rest of the district. No passenger vehicles had been passing through the village, except for an occasional jeep packed with visitors.

On April 19 talks were in progress in the Panchayat Bhavan between the SDO and a delegation of Santhals led by Father Anthony Murmu. The delegation had gone to the SDO to ask him why non-tribal Mahajans had fired gun shots in the morning. According to Babulal Murmu, who served as a bodyguard for Father Murmu and was present at the talks, "the SDO denied there had been any firing and said that what the tribals had heard was the sound of crackers". Father Murmu refuted the SDO's claim saying that he could prove there had been firing. In the meantime, Gopal Bhagat, a 'dalal' of the police, entered the room and interefered in the talks. An altercation followed with Father Murmu. According to Babulal, "The talks ended and we were about to go. But all of a sudden the Bihar Military Police posted there started indiscriminate firing on the defenceless crowd. People began running for their lives. I too ran away."

Tension had been simmering between the Santhals and the Dikkus (Santhal term for non-tribals) since March 25 when the Santhals had fished out the body of Mutru Murmu from the village pond. There had been no trace of Mutru for the last 15 days. The village pond had been auctioned for fising to Moti Bhagat, a forest contractor and big moneylender of the area and a strongman of the Congress(I), by the administration for Rs 2,200 for three years. It is customary for the Santhals to fish in the pond during their hunting season which begins after the harvesting of the rabi crop and continues till the onset of the monsoon. Moti Bhagat, however, forbade them to fish in the northern corner of the pond. The Santhals protested that this would mean that they would not get enough fish. Against this background, when Mutru Murmu's body was found in the pond, the Santhals suspected foul-play. They informed the Boreo police station. The body was kept near the pond for two days, but the police did not take any notice and even refused to register a case. The Santhals then held a meeting and resolved to deal with the situation in their own way. The meeting awarded the punishment of 'Bithlaha' (the Santhal edict to destroy a person's house as the minimum punishment for his crime) to Moti Bhagat. The sentence was executed and a part of Bhagat's house and a thatched godown were damaged. The same day some Santhal women were assaulted by a group of young Dikkus at the haat. The Santhals decided to boycott the haat and to hold a separate one at Saviaya village.

The incident of firing by the Dikkus on the morning of April 19 about which Father Murmu had sought to complain to the SDO has to be seen against this background of provocative acts by the Dikkus against the Santhals. It is now apparent in retrospect that the Dikkus had resolved to teach the Santhals a lesson in a much bigger way with the help of the Bihar Military Police.

After the massacre by the BMP, the Santhals were so terrified that those who had been injured in the firing preferred their own methods of treatment to going to the hospital. They feared that they would be killed in the hospital by the Dikkus or that the police would arrest them and shoot them dead. This correspondent was told that 40-50 Santhals were lying injured in the nearby villages. Only four injured Santhals had been admitted to the dilapidated Sahabganj district hospital.

The district authorities continued to maintain that only six persons had been killed and six injured. In fact 15 persons, including two children, had been killed, according to the Santhals. There are also good reasons for believing that the Dikku Mahajans had taken part in the attack on the Santhals along with the BMP. It is difficult otherwise to understand how so many casualties could have been caused by the 25 shots fired by the police. Three of those injured have gun shot injuries which could not have been caused by shots from police rifles.

The authorities have also claimed that Father Murmu and Madan Murmu, brother of the village Pradhan, had been killed in police firing while leading a 10,000 strong violent mob. The Santhals, however, maintain that they had been tortured and killed by the police. The nature of the injuries found on their bodies tells a tale of police brutality. Both had been shot dead at point blank range. Besides, they had rifle shot injuries on their palms as though they had raised their hands instinctively to save their lives. Father Murmu's left arm had been nearly severed by a sharp weapon. Who had attacked him with a sharp weapon: the police or the Dikku Mahajans? The district authorities did not inform Father Murmu's wife of his death nor did they return his body to her. Instead they handed over the body to Father Murmu's brother at Bhagalpur. The bodies of the other 14 Santhals who were killed were also not returned to their families. Contrary to the Santhal custom of burying the dead near their houses, the bodies of the Santhals killed by the police were cremated by the authorities.

In a bid to justify the police firing, the Dikku Mahajans have alleged that an enraged Santhal mob had set two houses on fire. What is difficult to understand is why the Santhals should have decided to set fire to a house belonging to a Muslim widow and to the village post office. Enquiries suggest that the Dikku had themselves set fire to the buildings to create evidence of a Santhal mob having gone on a rampage.

The age-old exploitation of the tribals continues unabated in this area. Usury is widespread. The interest rate is such that Rs 100 lent becomes Rs 150 in a year. The farm wage of Rs 4 or Rs 4.50 is much below the prescribed minimum wage, but there is no movement among the tribals on this issue. Besides farming, the Santhals depend on the forests. Dikku traders and contractors purchase firewood and forest produce from the Santhals at throw-away prices. Santhal women who go into the forest to collect kendu leaf, fruit and firewood are molested by Dikkus and by forest officials. The contractors indulge in illegal felling of trees and smuggle out the wood. A Santhal forest guard, Eric Hansda, had sought to oppose these illegal activities and had complained to higher officials and even lodged a case with the police. Later he was involved in a false case of carrying illegal arms and arrested. Hansda eventually got himself transferred.

The government too has emerged as a formidable exploiter of the tribals. The Bihar Minister of State for Welfare and Jails, Thomas Hansda, has admitted as much. The Forest Department auctions kendu trees belonging to the Pahariyas and Santhals, but the tribals are yet to receive compensation amounting to lakhs of rupees. Such cases are common in the Boreo and Barhet areas.

A significant aspect of the tension between the tribals and the Dikkus is the involvement of youth on both sides. The sons of the Mahajans have formed a gang at Banjhi haat to restrict the entry of Santhal youths into business. Santhals are stepping into business slowly. Madan Murmu had started timber business. Bhagat and Sheikh had taken this as a challenge to their monopoly. They started to use their influence to hold Madan Murmu back.

Father Anthony Murmu had been working to arouse consciousness among Santhals since 1975 when he left the church. He contested the parliamentary by-election unsuccessfully in 1975 as a Hul Jharkhand candidate. In 1977 he was elected to Parliament as a Janata party nominee. Later he came close to Congress(I) politics. In the last two elections—parliamentary and assembly—he had been counting agent of the Congress(I). But whatever his political affiliation, Father Murmu was wedded to the Santhal cause. He had been working tirelessly to revive their past glory. In this pursuit he had been organising a fair every year at Barhat, the old capital of Santhal Pargana, with exhibitions, dramas and cultural shows. The fairs have had a tremendous appeal for Santhals, attracting them from far off places.

Just three days before the massacre of Santhals by the police and 21 days after the March 25 incident, the Jharkhand Mukti Morcha (JMM) leaders had organised a meeting in Savaiya village. Sibu Soren and other leaders addressed the gathering and exhorted the Santhals to launch an agitation against the Dikkus. The meeting demanded immediate transfer of the Boreo police station in-charge and punishment for those involved in Mutru's murder. Simon Marandy, the JMM MLA, assured the Santhals that he would talk to the district administration about these demands. But later, even a week after the ruthless killing of Santhals, none of these leaders turned up in the area. Ther were busy manoeuvring for the assembly by-election slated for April 24.

Chief Minister Bindeshwari Dubey, who visited Banjhi, had to yield to the demand of several democratic organisations and opposition parties for a judicial probe. His ministerial colleague, Thomas Hansda, too confessed, before visiting journalists at Sahabganj, that there had been high-handedness on the part of the administration. In the meanwhile, Bibiyana Baski has, in a letter to the Supreme Court, prayed for justice and an impartial enquiry into her husband's killing.

# Social Tensions and Protest Movements in Maharashtra

### D N Dhanagare

GROWING social tensions have become an inseparable part of modernising societies and have been an important source of a variety of protest movements—a social reality that sociologists encounter practically everyday. These tensions and social movements emanate from the ever-widening gap between rising aspirations of the people and limited resource-base as well as limited capacities of social systems to fulfil them. In other words, certain structural conditions and institutional inadequacies in bringing distributive justice to diverse but competing interest groups or pressure groups give rise to tensions and protest movements which in turn contribute significantly to social dynamics and change. For far too long sociologists in India had neglected study of social and political movements and although in the last decade and a half some sociological studies and researches on social movements have taken place, no attempt has been made to bring this theme on the cognitive map of those engaged in the teaching of sociology at the undergraduate level.

The need of sensitising sociology teachers to their immediate social surrounding and social reality must therefore be acknowledged. With a view to make under-graduate sociology teaching more purposeful and relevant by enriching its content through illustrative material drawn from immediate life situations, a ten-day long workshop on "Social Tensions and Protest Movements in Maharashtra" was organised by the Department of Sociology, Poona University from March 18 to 27, 1985. The workshop formed an integral part of the Department's activities initiated under the University Leadership Programme (ULP) of the UGC. From time to time different seminars, symposia and workshops had been organised by this Department for orientation and training of sociology teachers from colleges affiliated to the Poona University. It was felt that the benefit of such an innovative exercise should go to sociology teachers from other universities in Maharashtra too.

The workshop was inaugurated by Ram Joshi who stressed the need for studying social protests and movements from a more analytical and a more sympathetic point of view. He went into the question of concepts and definitions of 'social movement' in his inaugural address. In yet another lecture Ram Joshi highlighted the social tensions arising out of the rapid and somewhat indiscriminate expansion of education (higher education in particular), the growing inequalities in higher education (particularly professional education), the falling standards and quality of academic excellence, and the failure of the educational system to bring higher education within the reach of the disadvantaged sections of society.

A number of topical themes were selected and on these lectures were arranged by guest-speakers consisting of social science scholars, social reformers and activists. D N Dhanagare gave two lectures spelling out a proper conceptual and analytical framework and typologies for studying social protests and movements. On the very first day Sharad Joshi, the ideologue of the Shetkari Sanghatana in Maharashtra elucidated the ideology, organisation, agitational strategies and tactics of the recent farmers' movement for remunerative prices for agricultural produce. On the theme of women's liberation movement Neelam Gorhe an active worker of the Nari Samata Manch, Pune, highlighted the ideological streams and shades represented by different women's organisations and recapitulated the main demands of the women's movement today. Sharad Kulkarni, an activist engaged in the work of tribal conscientisation talked to the workshop participants on the tribal movements in Maharashtra. He focused attention on the questions of forest-lands, bonded labour, and rehabilitation of tribals affected by the newly constructed dams. Related to the theme of tribal protest movements, yet another lecture was delivered by R K Mutatkar of the Anthropology Department, Poona University.

In recent times the Dalit movement in Maharashtra has attracted considerable attention of social scientists, politicians and activists alike. There are many thought streams within the Dalit movement and these were searchingly discussed by Baba Adhava of the Mahatma Phule Samata Pratishthan, Pune. He not only explained the legacy inherited by the present day Dalit movement from Mahatma Jyotiba Phuley and Babasahib Ambedkar but also stressed the need for a dialogue between the Dalits and the non-Dalits (caste Hindus) since confrontation would lead both of them nowhere except to growing distrust and disaffection. The reflections of this discontent are increasingly seen in Dalit literature. In fact one can talk of a Dalit literary movement in Maharashtra. On this theme V G Pundlik delivered a lecture elaborating the various protest themes and their sensitive nuances as they have been reflected in various literary forms—novels, autobiographies, short stories, plays and poetry. Apart from these Anil Awachat spoke on the *Devadasi pratha* (the tradition of temple-women) and problems arising out of this custom. Prabhakar Mande of the Marathi Department, Marathwada University, talked to the workshop on the theme of 'superstitions, folkways and beliefs of people in Maharashtra'.

The working class movement was discussed in three separate sessions. In one session M K Singh, Department of Sociology, Poona University, lectured on the problems of the working class movement today. Vijyendra Kabra from Aurangabad spoke on the changing nature of the labour/trade union movement, and different labour laws in Maharashtra. This was followed by the third session in which Malanibai Tulpule narrated her experiences while working as an activist in the workers' movement, specifically in the engineering, chemical and bidi industries. She totally rejected the view that the leadership of professional 'outsiders' is largely responsible for the problems of working class movements today.

The Hindu-Muslim tensions, the problem of Muslim identity and roots of communal riots were discussed by U B Bhoite, Sociology Department, Poona University, in his lecture, while the problems of rural-urban-migration and the social tensions in urban slums were critically analysed by A Bopegamage and A Ramanamma. The latter attributed the rise of the Shiv Sena movement primarily to inter-state migration and competition among ethnic groups for scarce opportunities.

Social tensions and protest movements arising out of regional disparities and developmental imbalances are burning issues today. The rise of the movement for a separate Vidarbha state and growth of a separate identity and consciousness among the people from the Marathwada region are cases in point. These were discussed by Vijayendra Kabra. He put forward the case of the Marathwada region very poignantly and criticised the recent Dandekar Committee's report which had bypassed the question of regional disparities as such by selecting the district and the taluka as units for assessing development. In the next session a counterpoint was presented by V M Dandekar who was chairman of the Committee on Regional Imbalances. He brought out the political motives and undercurrents of the hue and cry over regional imbalances. Through statistics Dandekar showed that often some talukas within a district have received most of the benefits of development while other talukas—for example, in Sangli district—have remained dry and drought-affected in spite of massive capital inputs in irrigation schemes in that district. Dandekar enumerated such instances of unevenness of growth both in the infrastructure (such as roads, transport, industries and irrigation) and in social welfare schemes (i e, education, health services and the like) and strongly defended the methodology adopted by his Committee in calculating the backlog of developmental expenditure districtwise, instead of regionwise. The two presentations, by Kabra and Dandekar, giving opposite viewpoints helped participants in the workshop in understanding the complexities of the problem of regional disparities, in separating myth from reality and also in seeing through the motives of the political elite who have vested interest in promoting the 'regional identity'.

A massive and somewhat indiscriminate expansion of education (higher education in particular) has not only created its own problems but has led to intensifying educational inequalities in recent times. Social tensions arising out of such disparities manifest themselves in agitations and protest movements both for and against the reservation policy. The recommendations of the Mandal Commission in general and its retention of 'caste' as one of the important criteria for determining social and economic backwardness in particular have sparked off such agitations and protests in certain parts like Gujarat, Madhya Pradesh and Bihar. The root causes of these social tensions and protests were discussed in a symposium in which six teachers representing different universities participated. The symposium was conducted by T N Valunjkar.

Some 10 teachers from Amravati and Nagpur universities, one each from Shivaji and Bombay Universities, two from the SNDT Women's University, seven from Marathwada and 13 from Poona University participated in this workshop. The workshop was in the form of a follow-up on a month-long Winter Institute which the Poona University's Department of Sociology had organised in November 1981 on 'Maharashtra—Society and Culture'. The exercise enabled sociology teachers to perceive and to bridge the gap between the arm-chair musings of social scientists and the grassroots level social realities as well as the problems faced by social reformers and activists working in different spheres. The nature of interface between social analysis and social action, the strength and limitations of both, and above all the need to bring effectively both of them into teaching and research priorities were revealed by the workshop with some measure of success.

# Fidel Castro on Third World's Foreign Debt

### Firdaus Jhabvala

TOWARDS the end of March, Fidel Castro, Cuban President, was interviewed by Regino Diaz Redondo, Director of *Excelsior*, one of Mexico's leading newspapers. At the time of writing this report, the interview was still being serialised. In the interview, Castro deals with a range of issues, including Central America, the Reagan Administration, Castro's own early years as a conspirator in Mexico in preparation for the overthrow of the Batista regime, etc. However, the first three parts of the serialised interview deal with the foreign debt of the Third World in general, and Latin America in particular. In three taped sessions that lasted 16 hours and three more conversations that went well into dawn, Castro sets out what he himself terms an 'Economic Proclamation'. His basic theses are that the foreign debt of the Third World is so large that it is not repayable; that the effort to extract just the interest on the debt is converting the deep social crisis of the underdeveloped world into a revolutionary problem; and that a just solution to the problem would be for the creditor nations to pay off the foreign debt of the Third World employing 10 to 12 per cent of the resources that go into armaments.

In what follows, I have translated excerpts from the Spanish text published in *Excelsior* and have attempted to select those parts of the interview that bear on the problem of foreign debt. Even so, for reasons of space, what follows is a sample of the interview.

Castro's first thesis develops out of the following question: "Could there be unity in Latin America among governments so dissimilar?"

Fidel Castro: "I think so. The economic crisis and the debt are what is going to unite Latin America, and it's going to unite it much more than the Falklands War (between Great Britain and Argentina). In this case, the Latin American people united because of a problem, we might say a sentimental, moral and political family relationship. We were dealing with the fight against a fellow people originating in a colonial pretension, a historical booty, an unjust act when England was the most powerful empire on earth. They saw in the Falklands War a European country against a Latin American one, but it was not something that affected vital patriotic interests for the Latin American countries. That is to say, except for this patriotic Latin American aspect and the political aspect of the question, they didn't have anything to gain or lose economically. This solidarity was really disinterested. However, given the relationship between the economic crisis of Latin America and its foreign debt, the solution of this problem is a question of survival for the Latin American countries.

"They talk of the crisis of the thirties. The present crisis is worse still. If oil is left out, the purchasing power of Latin America's export products is inferior to that of the crisis of the thirties. But without going back to such a distant date, calculating the prices of our products 24 years ago, the purchasing power of the principal traditional articles of export in many cases, among them sugar, is three to four times less at this moment . . . Now, we have a bigger crisis, accumulated social problems incomparably greater, and a debt of 360,000 million dollars [md].

"An arithmetical analysis of this situation shows that this debt is not payable, whether you analyse the situation of all the countries together, or of any one of them. In some cases it is more serious; but in all, without exception, it is serious.

"Brazil, according to the latest data compiled by the Economic Commission for Latin America and the Caribbean of the UN, owes 101,800 md; Mexico 95,900 md; Argentina 48,000 md; Venezuela 34,000 md; . . .

"Some countries, like Argentina, are utilising 52 per cent of their exports to pay interest on the debt; Bolivia uses 57 per cent; Mexico 36.5; Peru 35.5; Brazil 36.5 and Chile 45.5. It is considered that 20 per cent of the total exports for the payment of the foreign debt is in itself an unsustainable percentage."

Regino Diaz Redondo: "What do these figures signify?"

FC: "That the development of any country is impossible under these conditions, because the GNP of the Latin American countries as a whole has diminished between 1981 and 1984. In Uruguay, for example, by 13.9 per cent, in Argentina by 6 per cent, in Chile by 5.4 per cent, and in Venezuela by 6.1 per cent, despite the enormous economic resources of this country. As population increased in these years at the same time, the GNP per inhabitant was reduced even more. Thus, in Bolivia by 24.6 per cent, in Costa Rica by 14.1 per cent, in Chile by 11.2 per cent, in Mexico by 6.3 per cent, in Argentina by 11.8 per cent, in Venezuela by 16.2 per cent, and in Uruguay by 16.2 per cent. ... Some countries are making truly impressive efforts to face the situation."

RDR: "Can you cite three of the biggest, of the most important?"

FC: "Yes. Brazil, in 1982, had exports of 20,172 md; in 1984, exports were 26,960 md; imports, which in 1982 were 19,395 md, in 1984 were reduced to 14,360 md. Mexico, which in 1982 had exports of 22,081 md, raised exports in 1984 to 23,500 md; imports were reduced from 14,434 md in 1982 to 10,000 md in 1984. Argentina exported in 1982, 7,622 md and in 1984, 8,700 md; on the other hand, it reduced imports from 4,859 md in 1982 to 4,270 md in 1984. Through this great effort, these countries obtained favourable commercial balances. Brazil achieved a commercial balance of 12,600 md, Mexico of 13,500 md and Argentina of 4,430 md. All this balance, product of an extraordinary effort, using and practically exhausting the stocks of raw materials, and affecting possibly the maintenance and reposition of productive installations, has been invested exclusively, in each of these three countries, to pay the interest on the debt.

"The result is that only in two years, 1983 and 1984, the net flow of financial resources from Latin America abroad rose to 56,700 md. That is to say, the set of underdeveloped countries of Latin America are financing the development of the richer industrialised countries of the World with impressive sums of money. This is a real fact. And that money has escaped forever, no return is possible.

"In Bolivia, where the economic situation is more serious, between 1981 and 1984, GDP fell 16.1 per cent and GDP per capita 24.6 per cent in only three years. The value of Bolivian exports diminished, between 1982 and 1984, from 826 to 730 md. Its modest imports increased from 429 md in 1982 to 460 md in 1984, truly puny figures. It is practically impossible that a country with a population, the problems, and the needs of Bolivia can sustain itself with imports of only 460 md. The 270 md of favourable commercial balance obtained by that nation last year has had to be employed in paying interest on the debt. In Bolivia, in the Dominican Republic, and in Panama, the measures of the International Monetary Fund, or the attempt to apply them, have started serious political and social conflict, because the people are totally determined to oppose the imposition of new reductions of the living standard and new sacrifices."

### FOREIGN DEBT AND POLITICAL UPHEAVALS

This is Castro's second thesis: The attempt to squeeze interest on the debt out of the Latin American countries will lead to political explosions.

FC: "A democratic opening has been produced in the countries of South America and received with enormous interest and great sympathy in the region and in the rest of the world. The opening was produced almost simultaneously in Argentina, Uruguay and Brazil ... Then, the US Administration declares and almost presents this situation as one of the successes of its policy, that democracy is advancing in Latin America, when what is really advancing is the crisis.

"These democratic openings have taken place, of course, in part due to the struggle of the people and their resistance to dictatorships, but what has contributed considerably is that the economic crisis is so deep that the military, demoralised and stunned, do not feel themselves capable of managing the situation any more."

RDR: "With these conditions, could new civilian governments consolidate themselves in the region?"

FC: "We maintain that if the economic problems derived from the debt are not solved, these democratic processes will also inevitably enter in crisis. One cannot conceive the leaders of Uruguay, Brazil and Argentina, who have headed the democratic process in the face of long years of military dictatorship, hurling the army and the police to the streets to shoot people, in order to apply the measures of the International Monetary Fund and pay up the last cent of the debt. These leaders have said three things with total clarity: that they are not willing to lay upon the shoulders of their people the consequences of the debt; that they are not willing to apply recessionary policies; and that they are not willing to sacrifice the development of the country. That is to say, they have framed these three basic premises. What is still not answered is the form in which these premises can be applied if there is no solution found to the problem of the debt."

Castro explains that the crisis has overtaken the requirements of the IMF and so these are impossible to satisfy.

FC: "The IMF demands, first, the reduction of the rate of inflation and of budgetary deficits, restrictive measures of a social character that increase unemployment and aggravate the problems that have been accumulating and multiplied during long years.

"The reality is that if in 1983 consumer prices in Latin America as a whole rose 130.8 per cent, in 1984 they rose 175.4 per cent. With these levels of inflation it is practically impossible to manage the economy.

"How is it possible, in these circumstances, to demand from the set of Latin American countries whose economies have not only stagnated in the past years, but have actually receded, at the same time that population has increased at a high rate, that they extract from their economies 40,000 md every year, and that in 10 more years, they prepare to hand over the colossal sum of 400,000 md, only due to interest on the debt? What types of new sacrifices and restrictions will have to be applied in these countries in order to achieve the objectives of paying this fabulous sum in interest, and at the same time, reducing inflation and developing? ... This is a practically impossible task.

"In some cases, the levels of inflation are really amazing, as in Bolivia, where it reached 2,300 per cent; Argentina 675; Brazil 194.7; Peru 105.8, and so on. How can we ask that in one year they face these problems, reduce inflation, adjust the budgets and pay moreover astronomic quantities of money for interest on the debt?"

With facts and figures, Castro examines four different scenarios where Latin America attempts to pay its foreign debt, holding down the interest rate to under 10 per cent. Nevertheless, the arithmetic is such that in each of the four cases, Latin America pays up close to, or over, a trillion dollars in a period of 10 to 20 years. In other words, "the debt and its interest are unpayable".

### NON-PAYMENT WILL NOT AFFECT FINANCIAL STABILITY

RDR: "If the debt is not paid, what would be the consequences?"

FC: "It has been said that if the debt cannot be paid it would destabilise and sink the international financial system. It is not at all necessary that this occur. We propose that the industrialised creditor countries take charge of the debt of their own banks. As a norm, the public debt of the industrial countries grows, it is a historical law that it tends to grow; what the industrial states would do is simply respond for the interest on that growing public debt.

"The public debt of the US in 205 years reached the figure of a trillion dollars. When I speak of a trillion, I refer to the US trillion, equivalent of the Spanish billion, that is to say, one million million dollars. Well, then, in 1981 the public debt of the US reached that figure. Between 1981 and 1984, that is to say in only three years, it increased by 650,000 md more, and in 1986 it is supposed to reach or pass the second trillion. This, nevertheless, is hardly mentioned in the US. It does not appear to be a big thing to worry about. On the contrary, they emphasise that the economy grows and in fact they inform us that in 1984 it grew by 6.8 per cent. That is to say, if we stick to the official economic concepts and theory, the growth of the public debt has not ruined the economy, nor has it impeded growth, nor the optimism with which some US economists speak of the future development and growth of their economy. If the US, and other industrial powers, were to respond to their own private banks for the debt of Latin America and the rest of the Third World, this would imply an additional increment of their public debt.

"But where could the resources come from to respond for the interest derived from increases of this debt without in the least affecting the economy of the country?"

RDR: "From where, Commander?"

FC: "It's quite simple: from military spending, and not from all military spending, but rather from a small percentage, 10 per cent of those expenses, and if interest rates continue so high, from a maximum of 12 per cent. With that modest percentage of military spending, all the industrial powers can respond to their own banks for the foreign debt of Latin America and the rest of the Third World. Even so, military spending would continue to be fabulously high and worrisome.

". . . As is well known, at the present time, investment in military spending in the whole world is one million million dollars every year. And if the arms race does not cease, which the conscience of the universe considers absurd and unacceptable, in a world with more than a hundred underdeveloped countries and thousands of millions of people suffering from food, health, housing and educational needs, such spending would continue to increase until it lets loose a nuclear catastrophe, a risk that is even more worrisome than the economic catastrophe that a great part of humanity is already suffering."

RDR: "As regards military spending, President . . ."

FC: "It would be truly sensible and wise that a reduction of military spending were to be a beginning to the solution of international economic problems. All economists have proposed that with a part of military spending, they could solve the problems of underdevelopment and the problems that lash the world. This problem of recent military spending and the dangers it holds for humanity were at the centre of a recent meeting in New Delhi, where figures of such international prestige and authority participated as Rajiv Gandhi, Julius Nyerere, Raul Alfonsin, Miguel de la Madrid, Andreas Papandreu and Olof Palme."

RDR: "How would the US government respond before the creditor banks?"

FC: "This is the complete idea: The US, utilising the mechanism of Treasury Certificates, expiring in 10 years, and Treasury Bonds with expiry periods of upto 30 years, could respond to their creditor banks, for the amount of credit authorised to the Third World. This would not affect in the least the present contribution by US citizens to the budget. The banks would recover the capital invested, US export firms would increase their sales, and foreign investors their profits. What is much more important, such a solution would increase employment in all the industrial countries; their factories would use a higher percentage of capacity and international trade would expand.

". . . One should bear in mind that the fundamental problem of the industrial countries at this moment is not the internal public debt nor the foreign debt, but rather the whiplash of unemployment that grows constantly in the greater part of the Western countries, reaching the figure of 3 million in England, in spite of her new oil resources; 2.6 million in the FRG, a postwar record; 3 million in France; 2.8 in Spain, and so on."

RDR: "Then the benefit is mutual . . ."

FC: "The solution of the problem of the foreign debt of the underdeveloped countries could be an important step to get out of the prolonged international economic crisis that is very far from having been resolved in spite of the optimistic forecasts that some wish to present. The economy of the European Economic Community grew in 1984 only 2.4 per cent and better results are not expected in the present year. What does grow constantly is unemployment. According to very recent data, the US economy itself is facing difficulties with its growth in the first trimester of this year.

"The solution to the debt of the Third World, even though it would constitute without doubt a relief for many countries, would be far from resolving the problems of development. In a few years, the situation would be the same or worse than now if we do not overcome once for all unequal exchange, protective measures, dumping, monetary policies based on the economic power of a few countries, excessive interest on loans and other factors that integrate the unjust system of economic relations and of exploitation imposed on the countries of the Third World; that is to say, if a new world economic order is not established."

Several other points are made by Castro in his interview, and I shall try to sum up the most important ones. First, individual countries, acting on their own, cannot solve their debt problems, "precisely when the creditor countries are closely united in the IMF and the Club of Paris". Second, popular support will always be lacking for measures recommended by the IMF. " . . . The population does not understand it, nor can it. There is no other sacrifice for it other than a sterile sacrifice. It has been made many promises from a long time back and it sees things worsen every day. It doesn't understand any of those technicalities, they don't tell it anything, they don't offer it anything when it gets up every day and looks for work, or sees its salary diminished every morning and the goods costlier all the time. Remember what Lincoln said: 'You can't fool all the people all the time'." Third, attempts to create clubs of debtors, such as the Carthagena Group (of 11 Latin American countries) should not be limited to a few countries. Fourth, Castro's interest in the problems of the foreign debt is not, he points out, prompted "to reflect a problem of Cuba. We are fortunately today the only country of Latin America and the Caribbean immune to the crisis. Our debt in convertible money is minimal, hardly 300 dollars per inhabitant. We do not have any type of problem in our financial relations, nor in our trade with the socialist community, with which we realise fortunately 85 per cent of our trade. From 1981 to 1984, our gross social product grew 24.8 per cent and the product per inhabitant 22.6 per cent; our plans of economic and social development in the next 15 years are assured—which constitutes a true privilege in a stage like this for any country." Finally, the size of the foreign debt of the Third World is a pittance for the rich countries. "... Ever since the OPEC countries succeeded in raising oil prices from approximately 2.5 dollars to 30 dollars a barrel, the industrial countries, Europe, the US, Japan and others, in only eleven years, paid up for those additional oil prices sums that pass a million million dollars, much more than all the accumulated foreign debt of all the Third World, without ruining their economies nor even affecting their large military expenditures. Ninety per cent of that money came back to the banks of the same countries from where it had left. They picked up, moreover, the money spent on oil imports by the countries of the Third World that do not produce it. The prices of their exports multiplied. Numerous Western firms did fabulous business in view of the new acquisitive power of their oil clients, amongst them, arms manufacturers. Many technological innovations were made and many measures adopted to save fuel. New and old sources of energy were utilised. Waste diminished considerably. Only the non-oil producing underdeveloped countries suffered the catastrophe in all senses, and a new unequal exchange had arisen for them."

## RESPONSE TO CASTRO'S SUGGESTIONS

The response to Castro's remarks has been mixed. On the one hand, people like Jose Carral, Vice-President of the Bank of America, termed the proposal "utopian". Their argument may be termed the "honour factor": honourable people pay off their debts. On the other hand, people directly linked to the welfare of the Mexican masses termed the proposals as being realistic. Raul Alfonsin, Argentine President, on a state visit to Mexico, declared that "there cannot be discrepancies" with Castro's statement. Asked if Latin America had the arms, in the pacific sense of the word, to achieve the sensibilisation of the developed countries, Miguel de la Madrid, Mexican President, answered: "We have the arms of Reason and Right and the specific weight of the subcontinent of Latin America, its economic power; even though we are in difficulties, we influence the world economy. And we have the institutional and democratic tradition that is fortunately being reborn at this moment in a very vigorous manner."

The debt problem occupies the energies of Latin America as nothing else. Much more dependent upon the world (mainly the US) economy than, say, the Indian economy, the Latin American economies are straining to breaking point to pay up truly spectacular amounts to the world banking system. In some countries, outflows have surpassed 10 per cent of GNP. A country that grew five or six per cent when it received capital from abroad obviously cannot grow if it is drained of 10 per cent of its product. With the closing up of the few avenues to social advancement that existed, the middle classes are being quickly liquidated in most Latin American countries, placing severe pressure upon the fragile social order. From without, the bankers and their allies in classic Shylockian fashion want to be paid their pound of flesh: interest on interest on the debt. The governments of Latin America are rapidly using up their political capital to hold down the often miserable living standards of many of their people, and at the same time putting off Payment Day as far as is allowed by the banking system.

However, the less fortunate countries, such as Bolivia, are virtually flat out on their backs. They are busily fending off creditors without even the possibility of postponing P-Day. A few years ago, when the depth of the current world crisis had not been properly assimilated, some hoped that oil prices would pick up again (in the exporting countries such as Mexico, Venezuela and Ecuador). Others expected an upturn of the world economy, so that they could export more and ease their debt problems with the extra income (Brazil, Argentina, etc). Today, no such easy panacea to the debt problem is forecast. In all of Latin America prevails the idea that the creditor nations cannot collect the amounts involved. This final illusion has been slowly giving way to reality in the face of unrelenting economic pressure by the industrial countries when the Latin American economies most need their understanding.

In the light of sustained economic, social and political difficulties in Latin America, Fidel Castro's proposals would be the most humane and rational way of helping ease the region's terrible burdens. What is true of Latin America would be even more true of the near-starvation levels prevalent in much of Asia and Africa. For all the foreign debt problems of the region, Latin America is better off than most of Asia and Africa. For example, Mexico and India have virtually the same level of GNP, but Mexico has only 11 per cent of India's population. Therefore, per capita income is nine times as high in Mexico. Still, living standards are a relative proposition, and a sustained period of diminishing living standards would increase instability in Latin America. Unfortunately for the region, neither humanity nor rationality enter the calculus of the world banking system.

# Population and Environment

**Anil Agarwal**

CONSIDER the bare figures. Between 1901 and 1951, India's population grew from 238 million to 361 million, an increase of about 52 per cent over 50 years. Between 1951 and 1981, it expanded from 361 million to 685 million, a whopping increase of 90 per cent in just 30 years. India literally added a second India in the 35-odd years of its independence.

In 1967, William and Paul Paddock wrote a book called "Famine 1975—America's Decision: Who Will Survive?". They classified developing countries, based on their population growth rates and food production potential, into three categories: 'can't be saved', 'walking wounded' and 'should receive food'. India suffered the ignominy of being classified as 'can't be saved' with the comment that it "is the bellwether that shows the path which the others, like sheep going to slaughter, are following". India was a country, according to the authors, to which the US should not have bothered either to provide aid or food.

Fortunately, India's food production managed to keep ahead of population growth, which helped it through some of the most critical drought years like 1979. But the apparent stagnation in agricultural production—though in 1983-84 a new record foodgrain production of over 150 million tonnes was recorded—once again created despondency.

The 1981 census results turned out to be even more of a shocker than usual. The Planning Commission had just put the finishing touches to its Sixth Five-Year Plan when the registrar general of census announced that the country had some 13 million more people than the number estimated by the planners and that the birth rate was not 33 per 1,000 people but around 36. The Planning Commission had to hastily restructure the Sixth Plan to bring it into line with the new figures.

The key question for expert and layperson is: can India's lands support such a large and growing population? This is where the 'carrying capacity' comes in. It is the number of people or animals that an area of land can support on a sustainable basis. Unfortunately, not one expert in the country has attempted to quantify the carrying capacity of the area under a single development block, leave alone the whole country.

Indeed, it is an extremely complicated and uncertain business trying to set a figure to the number of beings a piece of land can support. Take the case of Fiji where, in 1973, UNESCO and the United Nations Fund for Population Activities (UNFPA) launched a pilot project to study the population-environment relationships in the eastern islands. The number of ecological variables were found to be enormous, putting paid to all efforts to put a figure on the small islands' carrying capacity. Only specific inferences were possible. For instance, eastern Fiji is caught in the stranglehold of the declining copra industry and is suffering from poverty and emigration. If the colluvial soils which have been planted with increasingly unproductive coconuts for copra export were converted to farming of taro, a root crop, it was estimated that upto five times more people could be supported with this economy than if they continued with copra. Any talk of carrying capacity must clearly be marked with great caution.

In a modern interdependent world, where trade plays a major role, the population supporting capacity of a particular area can in fact be increased enormously by importing a few critical items like plant nutrients from outside. Densely populated Europe today is heavily supported by the production of a range of items outside European countries, especially in the developing countries. The UN has never dared to estimate how much land in the developing world is today producing food and other items like timber for the developed world and how the quantity of this land has been changing over time. If such a study were undertaken, it would clearly show that, despite decolonisation in large parts of the Third World over the last three decades, many times more land is being used in developing countries to meet the needs of the developed countries as compared to 1950, and today this land use is a major cause of environmental destruction across the Third World. For instance, the first major attack on India's natural forests came with the demand to establish tea plantations to satisfy colonial Britain.

## INDIAN PROSPECTS

But what of India? It is useful to ask just what our land is physically capable of producing on a sustainable basis, without going into the thickets of social organisation and land reform. In late 1983, the Food and Agriculture Organisation (FAO) released an extensive study on the subject, 'Potential Population Supporting Capacities of Lands in the Developing World', the result of almost a decade's work that began with the preparation of a world soil map.

The picture of India that emerges is both exhilarating and sobering. Simply put, India has enormous problems but also has an equally enormous natural resource base to solve them with. Assuming a low level of inputs: local low-yielding varieties, no fertiliser use or chemical pest, disease and weed control, long fallow periods, no long-term soil conservation measures, high rates of soil erosion, steadily declining soil productivity, manual labour with hand tools as the only power source, high labour intensity, subsistence production and fragmented landholdings, the study reports that the population supporting capacity of the irrigated and rainfed areas together was 1.56 persons per hectare in 1975 compared to the 1.93 that existed in reality. In other words, in 1975, India had 119 million—or 19 per cent of the population—more people than its lands could support.

But assuming high and intermediate levels of inputs, the potential population supporting capacity of India's lands shot up to 6.84 and 3.53 persons per hectare: India's lands could have fed as much as three and a half times the existing population in 1975.

TABLE 1: INDIAN FOOD SITUATION OVER THE 1970s

| | Average 1969-71 | Average 1978-80 |
|---|---|---|
| Population (million) | 552.5 (1970) | 684.5 (1980) |
| Population index | 100 (1970) | 124 (1980) |
| Food production index | 100 | 127 (1979-81) |
| Food production per capita index | 100 | 102 (1979-81) |
| Calories per capita per day | 1999 | 1998 |
| Protein per capita per day (gm) | 49.5 | 48.5 |
| Fat per capita per day (gm) | 29.2 | 29.5 |

*Notes:* 1 It is important to note that the quantities of food available indicated in the Table relate to the quantities of food reaching the consumer but not necessarily to the amounts of food actually consumed, which may be lower than the quantity shown depending on the extent of losses of edible food and nutrients in the household.

2 The figures represent only the average supply for the population as a whole and do not indicate differences amongst socio-economic groups and ecological zones and seasonal variations.

*Source:* 1981 FAO Production Yearbook, Vol 35, Rome, 1982, FAO.

By the year 2000 the picture changes for the better because of the country's massive irrigation development plans. That year, India is expected to have a population of 1036.7 million and a population density of 3.23 per hectare. Because of the increased output from irrigated lands even at a low level of inputs, India's lands can support a population density of 3.24. At intermediate and high levels of inputs, the corresponding figures would be 5.62 and 8.18. If India can keep to its irrigation targets and manage its lands properly, by the year 2000 it can feed a population of upto 2,621 million, two and half times the projected population by that year.

To get a good idea of the crucial challenges ahead—if the basic food needs of such vast numbers of people are to be met—it is useful to understand the complex methodology of the FAO study. The first step is an inventory of the country's land resources as indicated by the 1:5 million FAO/UNESCO Soil Map of the World. The map indicates 26 major soil units which have been grouped into nine major soil classes. A separate assessment of the country's climatic patterns provides further information on major climates and lengths of growing period zones. A normal growing period is defined as the period in which rainfall exceeds evaporation and a growing period of less than 75 days is considered to be inadequate for crops. Data on the climate also provides information on whether the temperature poses any serious constraint on crop growth.

By integrating data from the land and climate inventories, it is possible to get a quantification of the land resources of a country in terms of soil and climatic conditions which can then be matched to the soil and climatic requirements of crops. In other words, this exercise results in hundreds of agro-ecological cells, each quantifying the extent of each individual soil (further broken down by soil phase, slope and texture class) as it occurs in each major climate and in each length of growing period zone.

Table 2: Potential Population Supporting Capacity of India's Lands

| | Year 1975 | Year 2000 |
|---|---|---|
| Actual population (million) | 618.7 | 1036.6 |
| **Low inputs** | | |
| Potential supportable population (million) | 499.7 | 1298.1 |
| Contribution of irrigated lands (per cent) | 56 | 87 |
| **Intermediate inputs** | | |
| Potential supportable population (million) | 1130.2 | 1800.1 |
| Contribution of irrigated lands (per cent) | 25 | 63 |
| **High inputs** | | |
| Potential supportable population (million) | 2191.0 | 2619.9 |
| Contribution of irrigated lands (per cent) | 13 | 43 |

*Source:* "Potential Population Suporting Capacities of Lands in the Developing World", FAO/IIASA/UNFPA, Rome 1982.

In the case of India, for instance, nearly 85 per cent of the land (270.5 million hectares) has a climate suitable for agriculture, where both rainfall and temperature conditions are adequate for crop growth. But only 57 per cent of this land (155 million hectares) has soils with no inherent fertility limitations. Of this land, too, about 60 per cent (95.6 million hectares) has a very short growing period of 75-179 days. On this land irrigation can lead to greatly enhanced production as water availability is the only constraint on production.

But slopes will also pose limitations. India's soils have been divided into three slope classes: slope A, level to gently undulating, where dominant slopes range between 0 and 8 per cent; slope B, rolling to hilly, where dominant slopes range between 8 and 30 per cent; and slope C, steeply dissected to mountainous, where dominant slopes are greater than 30 per cent. No soil unit in slope class C and only half of the soils in slope class B are considered fit for cultivation. These lands would best be under forests or well-managed grasslands. Nearly 51.3 per cent of India's land is in slope class A, 35.5 per cent under slope class B, and 13.2 per cent under slope class C. A large part of India's soils with no inherent fertility limitations are under slope classes B and C (together 87.9 million hectare).

Irrigation plays a very important role in boosting food production in India—more so than in most other developing countries. In its study 'Agriculture: Towards 2000', FAO points out that nearly three-fourths of the Third World's additional irrigation capacity will arise in the Far East between 1980 and 2000, and about three-fourths of this will arise in India alone.

In 1975, when India's land could feed only 500 million people using low inputs as against an actual population of 619 million, irrigated lands were meeting the needs of 280 million, that is, 56 per cent of the potential population that could be supported. By the year 2000, the study estimates that irrigated lands will be supporting 87 per cent of the potential supportable population of 1,298 million in that year. In other words, irrigation plays and will have to continue to play an extremely important role in the years to come if India's population is to be fed. And this irrigation will have to take place in a manner that is sustainable and not destructive of land through waterlogging and salinity.

To get an estimate of the land that would be under rainfed production, FAO experts subtracted the land under irrigation and land under non-agricultural uses To get an estimate of the land under non-agricultural use, the study takes an average figure of 0.05 hectare per person of non-agricultural land. This means that in 1975 India needed 31 million hectares of non-agricultural land (10 per cent of the total land area) and by 2000 it will need 52 millión hectares (16 per cent of the total land area).

### PRODUCTIVITY EXERCISE

In this way, the study obtains a number of agro-ecological cells available for rainfed cultivation. After selecting the input level (low, intermediate or high), each agro-ecological unit is then analysed separately for 18 different crops, including grasslands, to get an estimate of the livestock potential. Thus, the study obtains the crop which is most productive under the unique circumstances of the soil and climatic conditions of each agro-ecological unit. This gives the total productivity of each agro-ecological unit.

But a number of restraints are also applied to ensure productivity on a sustainable basis. Limitations on production are imposed by phase, slope and texture of the soils in each agro-ecological unit. Fallow requirements pose yet another constraint. The earth must rest, lie fallow between periods of cultivation—so that it can regain its normal vigour. The extent of the necessary rest period depends on the level of inputs, soil and climatic conditions and crops.

With low levels of inputs in the humid tropics, cultivation of Arenosol soils (2.4 per cent of India's lands) is only possible one year out of 10 if productivity is to be maintained and land degradation avoided. In contrast, Gleysol soils (2.6 per cent of India's lands) may be cultivated six years out of ten with the same level of inputs and climatic circumstances.

Probably the most important factor in agriculture is land degradation. Land degradation resulting from soil erosion/soil loss by water and wind, salinisation and alkalinisation, waterlogging, depletion of plant nutrients/organic matter, deterioration of soils structure and pollution, can lead to partial or even total loss of productivity, argues the FAO study. It is, therefore, very important to take this into account for calculating future productivity and population supporting capacity. Whereas it is possible to estimate the rates of soil loss under specific climatic, soil and land use circumstances, there is still no definite method to calculate the impact of soil loss on productivity. The FAO has used certain interim relationships between rates of soil loss and loss of pro-until further studies can show more accurate relationships.

An extremely important aspect of the FAO study is the fact that it considers soil conservation an important aspect of agricultural management. The scenarios dealing with low levels of inputs assume that no soil conservation measures are being undertaken and hence a full rate of soil loss and loss in productivity takes place. Intermediate levels mean some conservation measures and 50 per cent rate of soil loss, and high level of inputs means complete conservation measures and acceptable rates of soil loss with no impact on land productivity.

The FAO study does not publish separately any data for rates of soil loss in India but the study does show that the Southeast Asia region (which includes India) is the most susceptible region in the world to soil loss. Given the fact that India has large arid and semi-arid lands and also large tracts of land under higher slopes it would be correct to surmise that soil loss is a serious problem for India. If soil erosion were to continue unchecked, rainfed crop lands in Southeast Asia would decrease by 35.6 per cent by 2000 and rainfed crop productivity by 38.6 per cent.

TABLE 3: AREA COVERED BY DOMINANT CLIMATES IN INDIA ACCORDING TO SUITABILITY FOR AGRICULTURE

| Type of Climate | Area Covered (Million Hecatres) | Per Cent of Total Land |
|---|---|---|
| A Cold (severe temperature constraints) | 17.97 | 5.62 |
| B Warm/cool (no severe temperature constraints) | 301.64 | 94.38 |
| *Of which:* | | |
| Dry all year round (0 days) | 6.46 | 2.02 |
| Inadequate growing periods (1-74 days) | 24.67 | 7.72 |
| Short growing periods (75-179 days) | 172.77 | 54.06 |
| Long growing periods (180-365 days) | 97.73 | 30.58 |
| | 319.61 | 100.00 |

TABLE 4: EXTENT OF INDIAN SOILS BY SLOPES

| | Area (Million Hectares) | Per Cent of Total Area |
|---|---|---|
| Slope A | 163.70 | 51.30 |
| Slope B | 113.23 | 35.48 |
| Slope C | 42.18 | 13.22 |

*Notes:* Slope A—Level to gently undulating; dominant slopes ranging between 0 and 8 per cent.
Slope B—Rolling to hilly; dominant slopes ranging between 8 and 30 per cent.
Slope C—Steeply dissected to mountainous; dominant slopes are greater than 30 per cent.

*Source:* FAO.

The study also takes into account land that would have to be allocated for seed production and assumes 10 per cent harvest and post-harvest losses. The final variable is the choice of crop. At the low level of inputs, the study assumes that presently grown mixture of crops will be cultivated, regardless of the total calorie-protein production. At the intermediate level of inputs, the mixture of crops grown changes partly towards the crop giving the highest calorie production in each agro-ecological unit, and at the high level of input, only the optimum mixture of crops is grown. At the high and intermediate levels of inputs, a minimum protein requirement is also built into the optimal cropping mixture. In this way, the maximum possible production is estimated and matched with the requirements of the country's population.

## STUDY LIMITATIONS

There is no doubt that the study has many shortcomings and despite its complicated nature can only be called a first approximation of the carrying capacity of India's lands. Firstly, the scale of the soil map ought to be enhanced in any detailed study of India, which will provide better data on the extent of India's agro-ecological units. Secondly, the study does not earmark any land for production of cash crops. All areas under higher slopes have been kept aside as fit for forests for reasons of soil and water conservation, but no estimates have been made for lands that would be needed to produce firewood and timber near villages. Thirdly, the study does not take into account the possibilities of producing fish and products like algae from freshwater bodies and along the coast. Fourthly, the study assumes that irrigated lands will produce as expected which, given the past production record of irrigated lands, is highly optimistic especially in the case of India; a separate assessment is needed on sustainable productivity from irrigated lands. Fifthly, the higher inputs scenario assumes much larger use of fertilisers and pesticides and this could lead to serious environmental consequences. It would be better to assume a high input scenario based on biological nitrogen fixation, use of organic resources and integrated pest management techniques.

On the other hand, this rigorous exercise does show that in principle India should have no difficulty in meeting the food needs of its population for at least a century. The challenge lies in removing the socio-economic constraints to agriculture and moving towards higher levels of environmentally acceptable inputs. Indeed, in all areas where agricultural inputs have increased, agricultural production has increased and kept ahead of population growth. But because of environmental neglect a word of caution is necessary: whether even the high-input areas will provide sustained yields remains an open question.

The FAO study shows that a significant part of the increased production must come from its irrigated lands. Unfortunately, not only are yields from India's irrigated lands dismally low, nearly a quarter to half are threatened with waterlogging and salinity. In most areas, organic manuring is neglected. In the high production areas of Punjab, the problem of micro-nutrients is growing rapidly and soil fertility is being rapidly depleted. The drylands of India have been completely neglected and few measures for water harvesting and soil and water conservation have been promoted. R J Dudal, director of FAO's soil and water division points out that probably the most important input immediately needed is soil conservation measures: the land resources base cannot be taken for granted.

Madhav Ashish, environmentalist, has argued that good management of crop lands will require an equally good management of forest and grazing lands. For instance, the destruction of forests means shortage of firewood and greater use of cowdung as fuel which affects the fertility of the crop lands. The indiscriminate expansion of crop lands into marginal areas earlier used for grazing, means that not only grazing lands deteriorate but that cattle are pushed into forests for grazing, preventing regeneration and creating a perpetual firewood famine.

In sum, what the FAO study shows clearly is that the key factors that will determine future success are good soil and water management measures. Unfortunately, both elements are completely lacking in our agricultural management system. If India's people were to go hungry, it can be said with authority that it would not have anything to do with their number but with the callous mismanagement of the country's natural resources. Probably more than family planning programmes, India needs national 'ecodevelopment' programmes.

Ultimately, it is the nature of Indian society that will determine the carrying capacity of India's lands. Clearly, in a society where co-operation plays a major role in the use of natural resources as opposed to competition and personal acquisition, the carrying capacity will be much larger than what it is today.

# ZUARI AGRO CHEMICALS LIMITED

JAI KISAAN

## STATEMENT OF THE CHAIRMAN SHRI K. K. BIRLA AT THE SEVENTEENTH ANNUAL GENERAL MEETING HELD ON JUNE 12, 1985

Shri K. K. Birla

Ladies and Gentlemen:

I have the privilege to welcome you to the Seventeenth Annual General Meeting of the Company. You have already with you the Annual Report with the audited accounts and the Directors' Report for the year ending December 31, 1984. I seek your permission to take them as read.

At the outset I must express, on behalf of the shareholders, the Board of Directors, the employees, and myself, profound sorrow at the death of Prime Minister Indira Gandhi, who guided the destiny of the country for nearly two crucial decades in the formative years of our young democracy. With rare vision, indomitable courage, dedicated commitment to the unity of the country and boundless love for the common people of our country, she not only captained the ship of state ably but also contributed in great measure to international peace and harmony. The most appropriate tribute to her would be to continue to work hard and endeavour to further the causes for which she so valiantly lived and died. Our country is fortunate that the people have chosen, with an unprecedented mandate a youthful and dynamic leader, Mr. Rajiv Gandhi, who now leads the nation as Prime Minister.

The progressive and pragmatic policies of the Government are reflected in the budget proposals presented by the Finance Minister. This budget recognises the need to revitalise the economy. It also reflects the Prime Minister's approach to liberalise economic policies and take the country into the technological and industrial culture of the 21st century. People in all walks of life have welcomed the budget proposals. The reduced burden of taxation, incentives to industry, liberalisation of the licensing policy, and the benefits provided to various sections are, illustratively, some of the salient aspects of the new deal. In the perspective of the progressive policies of the Government and the healthy economic environment, the coming years offer new opportunities to business and industry for growth and service, and we can look forward to a period of accelerated economic progress, prosperity and social justice.

A review of the economy at the end of the Sixth Five Year Plan indicates that the country has done well in the agricultural sector with bumper crops in two successive years. The production of foodgrains during the last three years of the Sixth Five Year Plan increased significantly from 129 million tonnes in 1982-83 to 151 million tonnes estimated in 1984-85. Undoubtedly this is a good performance, but there is no room for complacency, especially in view of the need for providing food for a growing population. In the industrial sector also, there has been considerable improvement in the output of goods and services. The economy as a whole is gathering momentum.

The need to improve food production would necessitate higher production of chemical fertilisers. It is estimated that the fertiliser production in the country has to be increased from the current level of about 7.5 million tonnes to nearly 20 million tonnes by the turn of the century to achieve self-reliance in the availability of this vitally needed input. The Government has already initiated steps to meet the challenge. A number of projects to build giant fertiliser complexes based on proven reserves of off-shore gas are already under implementation and plans are under review for additional capacity. As you know, your Company has been entrusted the responsibility of setting up one of these plants near Sawai Madhopur in Rajasthan, to which I shall revert later.

When the new plants in Gujarat, Madhya Pradesh, Rajasthan, Uttar Pradesh, Andhra Pradesh and Orissa are commissioned, the fertiliser production in the country is expected to go up to over 12.0 million tonnes. The demand for fertilisers will continue to outpace supplies, and at the end of the Seventh Plan period we will still have a gap of nearly three million tonnes. The targets in the Eighth Plan will be still more ambitious in view of the need to further boost the production of foodgrains. The current production of 151 million tonnes of foodgrains will have to be increased to over 225 million tonnes by the turn of the century to meet our needs. The challenge can be met primarily through increased use of irrigation and fertilisers. All this gives us some idea of the gigantic task before our industry in the years to come.

Let me now turn to the performance

of the Company which has by all standards been excellent. The gross profit rose from Rs. 15.80 crores to Rs. 21.90 crores. The profit before taxation also showed a substantial increase from Rs. 8.84 crores to Rs. 14.85 crores. The net profit stood at Rs. 10.48 crores compared to Rs. 4.94 crores in the previous year.

These results were achieved mainly because of the marked improvement in the performance of our Ammonia and Urea plants during the year compared to the previous year. The capacity utilisation of Ammonia and Urea plants was 90% and 94% respectively as against 83% and 86% in 1983. Our new project to manufacture Di-Ammonium Phosphate (DAP) was commissioned on schedule and within the budgeted cost in December 1984. The DAP plant is presently operating at the rated capacity. This project has enabled us to more than double our capacity for the manufacture of phosphatic fertilisers. The performance during the first five months of the current year has been very satisfactory. The production of Urea and Complex fertilisers at 201,256 tonnes is higher than the production achieved during the same period last year.

Last year I had referred to the proposal to set up a gas-based fertiliser plant near Sawai Madhopur in Rajasthan. I am happy to inform you that this project is now under implementation. Your Company has promoted a new company "Aravali Fertilisers Limited", to put up this large fertiliser complex near Sawai Madhopur in Rajasthan. The proposed complex will be designed to manufacture 1,350 tonnes of Ammonia per day and 2,250 tonnes of Urea per day. The Letter of Intent for the Rs. 750 crore project was received in the last quarter of 1984. The site for the complex has been selected and action initiated for acquisition of land. Acquisition formalities are expected to be completed shortly. The pre-construction activity has gained momentum and I am confident that the project will be commissioned as per schedule.

After a careful review of available technologies, the Company has selected the catalytic steam reforming process based on Haldor Topsoe technology for the Ammonia and Snamprogetti's ammonia stripping process for the Urea plant. These technologies are well proven both in India and other countries.

Your Company has also applied for an industrial licence to set up a one-million-tonne per annum capacity cement plant at Mandalgarh in Rajasthan. The Letter of Intent for this project is expected to be received soon. Meanwhile, prospecting of limestone deposits in the Mandalgarh area is progressing satisfactorily.

It has been already mentioned in the Directors' Report that the Company plans to acquire a bulk carrier for transporting Phosphoric Acid from North Africa and U.S. Gulf to India. The raw material is needed by our expanding fertiliser industry, and we feel that this avenue offers good opportunities for growth.

In our endeavours to keep pace with high technology, which is assuming greater significance, we are seriously considering diversification into the field of manufacturing telecommunications equipment.

The Directors' Report has referred to the Company's achievements in marketing. It stands to the credit of our marketing staff that our sales have crossed, for the first time, the half-a-million-tonne mark. Our enlarged marketing area includes parts of Madhya Pradesh and Uttar Pradesh in addition to the existing areas of Goa, Andhra Pradesh, Karnataka and Maharashtra. The Urea produced at the proposed plant of Aravali Fertilisers Limited will be marketed in Rajasthan, Madhya Pradesh, Uttar Pradesh, Haryana and Punjab to meet the increasing demand of fertilisers in that region. This will give you some idea of the challenge we will have to meet in the years to come. I assure you that our people in the far-flung marketing regions will deliver the goods and while maintaining our high professional standards.

I now refer to your Company's efforts in the field of environmental conservation. I would like to reaffirm that the management continues to accord priority to its responsibility of maintaining not only high but exemplary standards of environmental conservation. It would be no exaggeration to say that our plant is one of the cleanest in the country and we will continue to maintain the highest standards to preserve and improve the environment around us.

The Company's safety record has also been excellent. At the plant, the most rigorous and stringent safety measures are followed. Our employees deserve compliments for a high level of safety awareness. I have no doubt that this record of safe and accident-free operation will be maintained.

In the past, at this very forum I have pleaded for a review of the fertiliser pricing policies. Frankly, such a review is long overdue. I hope that the pricing policies will be re-oriented to ensure adequate return on investment and encourage modernisation and growth.

As we look back, I can say with a great deal of pride that Zuari Agro Chemicals has put in a commendable performance over the years. More than anything else, we have succeeded in building a professionally managed organisation which has earned a reputation for excellence. Looking ahead, I believe that the professional competence of our people will enable us to shoulder the new responsibilities in our journey towards the new frontiers of growth.

I would like to place on record my appreciation of the dedicated efforts of our employees and their valuable contribution to the success of the Company. I take this opportunity to thank them most sincerely for their support and cooperation.

In conclusion, I express my gratitude to the Government of India and the Government of Goa, Daman and Diu for their guidance and continued support. I must also thank our technical collaborators, Messrs United States Steel Corporation for their whole-hearted cooperation.

Thank you.

*Note: This does not purport to be a record of the proceedings of the Annual General Meeting.*

# Towards a Macro-Economics of India

**Amit Bhaduri**

**The Labour Surplus Economy: A Neo-Keynesian Approach** by Mihir Rakshit; Macmillan India Limited, 1982; pp ix + 295, Rs 110.

THIS book bears the mark of sustained reflection over the years by one of the most distinguished teachers of economic theory in India. Any serious teacher of economics in India cannot escape a certain feeling of despair. Macro-economics, as it is normally taught, has at best only marginal relevance for an underdeveloped country like India and, at the worst, we mislead students about the utter irrelevance of fashionable high theory of the neo-classical variety. It goes to the credit of Mihir Rakshit that he has the intellectual courage to face this challenge honestly. He does not tread the path of least intellectual resistance, either by relying on empty left-wing slogans or by taking recourse to the usual right-wing mystification of the market mechanism as the best available cure for all economic evils. Instead, he carefully develops his argument more or less from the first principle, in search of the essential ingredients for a relevant macro-economic theory for India. The book deserves our grateful and serious attention, if only for that reason.

The book is quite ambitious in its theoretical scope; too ambitious, some (including the present reviewer) might say. Instead of starting with a few structural and institutional characteristics of an economy like India's and a few 'stylised facts' to be explained in that institutional context, Mihir Rakshit starts at the other end. His theoretical enquiry spans a whole historical spectrum, starting from a pre-industrial society in the image of the physiocrats with landlords, peasants and artisans (chapters 2-4 especially) to a 'dual' economic structure with a modern, capitalist manufacturing sector coexisting with some form of pre-capitalist and capitalist agriculture. This forces the author not to build his formal models around one central insight or idea, but a series of specific models, mostly exhibiting short-period adjustments to macro-economic balance ('equilibrium') conditions in a variety of institutional contexts. This way the book gains in range, but I suspect, loses in the depth which could otherwise have come from the author's pursuing a central idea as the 'organising principle' of his entire analysis.

Rakshit begins (in chapter 2) his analysis by demonstrating how the level of non-agricultural output may be demand-determined even in a pre-capitalist economy. If the relative price of the product of this artisan sector is assumed fixed in terms of agricultural produce ('corn'), then the level of demand for artisan products by agriculture in terms of corn is simply the marketable surplus of agriculture. This yields the balance equation,

$$\beta Y = X_s, \text{ or, } Y = \frac{X_s}{\beta} \qquad \ldots (1)$$

[**Rakshit's** (2.5)]

Where $\beta$ = artisans' propensity to spend on corn, $X_s$ = marketable surplus of corn, and Y = level of output of the artisan sector.

Note that marketable surplus $X_s$ plays the same role in (1), as does investment in the Keynesian theory of output determination.

However, instead of treating $X_s$ as autonomous, at least in the short period (which would have been akin to Keynesian theory), Rakshit endogenously determines $X_s$. This is the weakest part of his basic model, where he takes recourse to the dubious, neo-classical marginal productivity relation [his equation (2.1)] to determine agricultural output. Given landlords' and peasants' propensities to consume out of that agricultural output, the marketable surplus $X_s$ becomes a residual variable [see his (2.2) to (2.4)] and non-agricultural output is determined by virtue of (1) above.

When he introduces government (in chapter 3) or international trade (in chapter 4) or even money and inventory holding in a rudimentary form (in chapter 5), we basically have successive stages of modification in equation (1) through changes in the level of marketable surplus $X_s$ [see his (3.2), (4.5a) and (5.5) in particular]. The most interesting point he makes in this context is about export of corn: The more corn is exported, the less is the level of agricultural marketable surplus $X_s$ and, therefore, the lower is the level of non-agricultural output from (1). This suggests the operation of a *negative* foreign trade multiplier through the export of primary products (p 55) and perhaps contains an important ingredient for an analysis of economic imperialism and neo-colonialism. Rakshit however touches this issue only tengentially with a few passing observations on 'de-industrialisation'.

The argument reaches a more complex level (in chapter 6) when the model of a dual economy is explicitly considered with flexible terms of trade. Somewhat suddenly, there are too many changes in economic assumptions in this chapter and it would have been better to call it Part II of the book. Now we are in a capitalist economy with prices determined by the historically given money wages and the degree of monopoly. This, in turn, determines the relative price or terms of trade [equation (6.4)] between wage and non-wage goods. But before this scheme can be applied to an underdeveloped country like India, the author also finds it necessary to break up the total output of wage goods into that produced by a capitalist sector and the remaining produced by a non-capitalist sector (p 136). The basis of the subsequent analysis is formed by the assumption that the non-capitalist sector is supply-determined, while the capitalist sector is demand-determined. On this basis an elaborate set of market-clearing conditions are set up where demand equals supply in individual markets. Finally, we are prepared for 'dynamic' analysis, where the non-wage good (Y) market has quantity adjustment while the capitalistic sub-sector of the wage good market (X) undergoes price adjustment. This class of models with partly price and partly quantity adjustment are widely gaining acceptance (e g, Lance Taylor, "Structural Macroeconomics", Basic Books, New York, 1983, chapter 3). Rakshit's systematic analysis based on the usual *local* stability analysis (using Hurwitz condition that the real parts of the roots are negative) leads to a set of interesting comparative static results (*via* the so-called 'correspondence principle', see especially pp 151-153). And the same line of enquiry is further extended both by considering alternative hypothesis about the adjustment process of the agricultural/wage goods sector (pp 159-166) as well as through detailed classification of the possible character of the operative constraint on the non-wage goods (Y) sector.

One of the most ambitious and refreshingly novel aspects of this book is its attempt to model (in chapter 8) the dualism of the organised and unorganised credit market and then try to integrate the analysis of the credit market with the rest of the economy (i e, the wage and non-wage goods sector) in the final chapter 9. If this sounds like the 'dichotomy' between the 'real' and the 'monetary' aspects *a lá* the IS-LM apparatus, the novel aspect is to be found in the author's insistence also on the 'flow' equilibrium in the credit market. This was introduced as early as in chapter 5, where, for example, the possibility of the flow of consumption credit affecting the level of marketable surplus (X) and hence the level of demand-determined output in the non-agricultural sector (see equation 1 above) was indicated. Such a simple conclusion is largely lost in the more complex analysis (of chapters 8 and 9) and the elaborate adjustment equations of chapter 9 (especially pp 252-255) provide heavy algebra without many further clear-cut economic results. At this final stage, the book seems to suffer from the usual syndrome of neo-classical 'general equilibrium'-type analysis where 'everything depends on everything else' and unambiguous results become hard to obtain! The book ends with a long (pp 256-286) and interesting appendix on the much debated issue of tenancy in agriculture.

Any reader who carefully goes through the argument of the book will naturally find many points of disagreement about how to model a complex economy like India's. There can however be no doubt that he would also learn an enormous amount from the careful step by step analysis through which Rakshit guides him. In particular, it is to be hoped that the builders of computable, econometric models of India would pay a lot of attention to the analysis presented in this book for fresh insights about the 'relevant' macro-economic relations. (I have often wondered whether the 'stability conditions' which play such an important role in theoretical discussions could not serve as a criterion in deciding which econometrically estimated parameters are especially sensitive for the model being used.) However, in spite of my admiration for the serious intellectual attempt made by Rakshit to take some steps towards a macro-economics of India, I am left with the awkward feeling that this book has not entirely succeeded in making the right theoretical simplifications necessary. In particular, the analysis would have gained a lot by introducing 'an ordering of markets' in terms of their *relative* speeds of adjustment (e g, 'adiabatic approximation', as it is called in mechanics). This method, I believe, was essential for Keynes' treatment of historical time in the General Theory, but it got lost in the subsequent neo-classical 'synthesis' of the IS-LM variety. Second, the relation between marketed surplus and commerce remains largely unexplored in this work. Yet it is my guess that one of the distinguishing features of underdeveloped capitalism is the peculiarities of its commercial system. Rakshit touches this point tangentially at several places, but it does not get formally integrated with his main argument. It is probable that neither quantity nor price adjustment induced by excess demand/supply (which constitute the basis of Rakshit's dynamic processes) would tell us the essential story until we learn how demand and supply conditions are moulded by the commercial relations. It is in these areas that bold, imaginative advances are necessary before any real success can come in modelling the Indian economy.

# Ford, Chrysler and I

### H T Parekh

**Iacocca: An Autobiography** by Lee Iacocca with William Novak; Bantam Books, 1984; pp 352, $ 19.

THE US automobile industry is of course the first and largest in the world. Lee Iacocca's autobiography, published in 1984, became an instant best seller in the non-fiction list. It provides a deep insight into how the US auto industry grew, what types of problems it had to face from time to time, and what innovations it was required to make to expand the market, to reorganise itself and to remain viable and profitable. The book is highly stimulating and provocative and, in my view, essential reading for managers, executives, bureaucrats and economists. The author is forthright, pungent and unsparing. His style is racy, so the book makes easy and lively reading.

The book easily divides itself into two sections. The first section is the Ford story, because the author spent the first over 30 years of his career in the service of Ford Company, but after reaching the position of President of the company was fired by his boss Henry Ford II. Lee joined Ford Company as a young engineer, but rose rapidly in the first ten years by proving his salesmenahip and marketing skills. When MacNamara left Ford to join the Kennedy administration in 1960, Lee got his chance by proving his other managerial skills, to reach the top executive position of President in the next ten years.

Henry Ford I pioneered the auto industry, but managed the company in his own personal way as was the way with business tycoons in those days. After World War II, his grandson Henry Ford II came in charge. He found the company in a shambles, but revived it by taking on a new team of bright young men with fresh ideas of management. The list included dynamic persons like MacNamara and Lee Iacocca, fresh from World War II, representing the new executive class who ushered in the management revolution. A group of ten young men joined the Ford Company as a team under the leadership of MacNamara who had a computer mind and succeeded in reorganising the company from old style management to modern management in keeping with the needs of the twentieth century.

The Chrysler story constitutes the second part of the book. Lee joined Chrysler soon after his dismissal in 1978, when that company was rapidly sinking, and poured new life into it with the force of his many-sided personality. It is this success story which made him famous.

Both stories make fascinating reading and for Indian executives in the private and public sector many lessons can be usefully drawn from the Chrysler story, especially when sickness in industry is the refrain one hears all the time from government, industrialists and financial agencies, without much comprehension that sickness can be cured through leadership, personal determination, application, innovation and of course government assistance at the right time and in the right manner and with the active co-operation of and equal sacrifice by all parties, particularly labour and banks.

Competition is the soul of progress and even an oligopoly of three competitors, of varying sizes, in the auto industry can contribute a great deal to advance an industry, quantitatively and qualitatively, as the US auto industry has demonstrated. General Motors made and sold 5 million cars, Ford half that figure and Chrysler half of what Ford sold. And yet each company had its strength and weakness and as each fought the others at the plant level and in the market place, each learnt something from the other in technical, organisational and marketing fields. They all passed through difficult phases and had to face choices in regard to big *versus* small cars, cheap *versus* luxury cars, a car for each need and for each class of earners. Though Chrysler was the smallest of the three, it led the others in engineering skills, in bringing out fuel-economy cars and in other technical achievements such as being the first to introduce hydraulic brakes, electronic ignition, etc. This ultimately accounted for Chrysler's revival after touching a near-bankruptcy stage, by introducing the K-cars, compact, light, solid, comfortable, fuel efficient, front wheel drive, four cylindered and at the same time stylish—and other models, where it could steal march over the others.

The book shows that Iacocca is self-centred, egoistic, full of himself, somewhat difficult to deal with, over-ambitious and yet his remarkable success at Ford and Chrysler is attributable to his innovativeness, enormous energy, quickness of decision, foresight and, above all, his high degree of salesmanship. His management style is well organised but also highly personal, as against the multiple committee style management at General Motors, but he proves his capacity to look ahead, to manufacture what people want in a fast changing market. Henry Ford I's first model made USA car-conscious. He had the imagination to pay wages which were twice the prevailing levels because he felt that the masses must be enabled to own a car, cheap, simple, utilitarian. After him, his successors came up with the Edsel model which failed miserably. MacNamara produced Falcon in the old Ford style and succeeded. Iacocca produced the Mustang which was an instant success because it appealed to the younger generation. With the growing prosperity in the US in the sixties and with the two-car family and the coming on the scene of women as car purchasers, the car market expanded feverishly. Lee later produced Mark II and revived the expensive car division of Ford, Mercury/Lincoln.

Lee depended on market research into changing tastes and fashions and he believed that there must be a model for people at every level of income and for every type of need. People bought a cheap car but were willing to spend more on new frills.

In the sixties, petrol was cheap and the fashion was to have big, roomy cars. OPEC turned the tide in the seventies when oil prices rose steeply, almost ten times, which gave a big jolt to US car manufacturers and made possible the coming in of the economical Volkswagon and the Japanese cars. That forced US car manufacturers also to make sub-compact cars to fight imports. The fortunes of the US auto industry fluctuated widely in the seventies and it took a decade before it came out of the woods in the early eighties but not before it was rudely shaken by the Japanese who brought out quality cars at cheaper prices and made life hell for the US auto industry. The strong US auto industry was forced by competition to adopt new ways of manufacture with the help of robots and to emphasise cost cutting. Ultimately it was even forced to seek partnership with Japanese and other foreign manufacturers.

So far as the dismissal of Iacocca is concerned, it was perhaps the result of a clash of personalities—the determination of Henry Ford II to keep the company in the family and his fears that Lee might someday become too powerful and snatch the company away from the family. Ford accepted professional management, but only under family domination. He was an autocrat—King Henry—and also a spendthrift and easy-going. Yet he showed his shrewdness and acumen in selecting the right men, such as MacNamara and Lee, early in his life, when he took over the responsibility of the Ford Company, and did not interfere in the day-to-day management of the company, leaving it in able hands.

## THE CHRYSLER STORY

Lee is at his best when facing a challenge, which his new job as President of Chrysler provided. He took over his new job in 1978, immediately after his dismissal from Ford. He found a different management style, lack of team-work, acute financial stringency, an uncoordinated management structure, as also steep rise in oil prices which brought down sales of big cars, and sharp rise in interest rates which went against purchases of cars on credit. He was faced with a large inventory of unsaleable finished cars and used cars and loss-making overseas Chrysler joint ventures, all leading to an impending threat of bankruptcy. He rose magnificiently to meet these challenges. He fired old executives and selected his own team out of old Ford executives and retired executives; he took bold decisions to sell loss-making plants, foreign ventures, even earning units like the tank unit to mobilise cash, he liquidated the unwanted inventory at a heavy loss to have more funds, he revived confidence in his dealers and buyers by wide, forceful publicity, took a $ one salary and induced his executives and workers to accept a cut in their salary, as the only alternative was to face unemployment.

Ruthless cost cutting was his strength. Financial control was his strong point and he succeeded in bringing order, discipline and system in the Chrysler organisation. His slogan was people, products and profits in which the first was responsible for the rest. Quality and productivity were two sides of the same coin and he stressed both these equally.

He succeeded in obtaining government guarantee for $ 1.2 billion without which he could not have got more funds for his new models and for working capital. He had to fight US business and US banks who worked against his obtaining the government guarantee and finally won. He never lost heart and proved himself an outstanding leader by putting Chrysler back on its feet and even paid back his creditors and the government in three years.

He believed in free enterprise, but also revised his thinking to seek government aid to keep up competition in industry and to avert unemployment.

Even when Lee had got over the initial hurdles, 1980 and 1981 proved full of problems and the company incurred huge losses due to the simultaneous operation of recession, energy crisis and government regulation. He nonetheless worked to produce what they called K-cars, stylish from outside, with a seating capacity of six persons, fuel economy and, at the same time, strong and light so as to give a higher mileage than the competing cars. After two anxious years, Chrysler began to make profits in 1982 and 1983. It was a spectacular recovery which enabled him to prepay his debts, raise more equity and capture 20 per cent of the compact car market.

Iacocca has a lot of praise for the Japanese cars but he is strong in his belief in the need for protection or a quota system for imports and against total free trade in a world where different degrees of protection is the order of the day. Towards competitors his policy is that when you are not able to fight them face to face you outflank them by producing new models such as the Mini van convertible, etc.

It must be said to his credit that in less than five years he changed the face of Chrysler by keeping to his promise of modernising car plants, adopting the latest technology, giving all his cars front wheel drives, taking the lead in fuel economy, maintaining employment and coming out with newer products. He achieved the highest production and profits ever by Chrysler in its over 50 years of life.

Iacocca is most bitter about bankers. He had less trouble getting the government guarantee for $ 1.2 billion than some concessions from banks. His criticism of banks is that when they make wrong loans the Federal Reserve protects them but when industry seeks help in times of difficulty, they are hard to deal with. The bank-industry relationship is one of love-hate, but while in other countries such as Japan and West Germany there is a close rapport between them and with the governments, there is no such relationship in the USA.

The work is full of provocative observations which set one thinking, even as the story of Lee Iacocca unfolds in a most readable manner.

## State Protection for Rural Proletariat of South Gujarat

**Jan Breman**

*Gujarat is one of the states in which the government claims to make vigorous efforts to improve the conditions of those who, in official jargon, have fallen behind in the development process. In this context agricultural labourers from an important target group, and several years ago a separate government agency was set up especially for them, to supervise compliance with the law on minimum wages. A Rural Labour Commissioner based in Gandhinagar heads the organisation, which has its own offices and personnel in every district with a high percentage of landless. Surat in South Gujarat is one of these concentration areas.*

*Presented here are the author's first critical observations, based on intensive field research in three talukas, on the government's claim that the special provision introduced offer effective protection for the very large landless class in the South Gujarat countryside.*

### I

### Introduction

'WHERE are you working today? How much do you get?' The agricultural labourer, completely taken aback, hesitates before answering these questions which are put to him so aggressively. We have overtaken him on a country road, and my companion has to shout loudly to make himself heard above the sound of the motor cycle, but we stop our vehicle when we hear that the man earns only five-and-a-half rupees a day. The briefcase is opened to bring out the forms, and now we begin to fill in yet more facts. A stamp pad appears, and the agricultural labourer's thumbprint guarantees the accuracy of the information he has given us. Content at having recorded yet another case of underpayment, we ride on in search of our next victim.

Today I am touring my fieldwork area with a government labour officer. Gujarat is one of the states in which the government claims to make vigorous efforts to improve the conditions of those who, in official jargon, have fallen behind in the development process. In this context agricultural labourers form an important target group, and several years ago a separate government agency was set up especially for them, to supervise compliance with the law on minimum wages. A Rural Labour Commissioner based in Gandhinagar heads the organisation, which has its own offices and personnel in every district with a high percentage of landless. Surat in South Gujarat is one of these concentration areas. According to the last census, in 1981 agricultural labourers comprised 54.6 per cent of the agrarian workforce. With a total number of 281,025 the size of this class is bigger than in any other district of Gujarat state. In the fertile and densely populated agricultural zone upon which I have centred my current research—three talukas in the central plain—their percentage rises to 80 or even higher. Such an over-representation is quite exceptional in India. In twelve out of the thirteen talukas in the district, there is an assistant government labour officer under the command of two senior officers who man the headquarters in Surat city.[1] Most officers have motor cycles, and each of them is expected to spend at least twelve days of every month in the field making a total of 200 inspections. Besides this they hold sessions one day a week in the office of the taluka administration to hear labourers' complaints and farmers' reactions to these.

Within the governmental bureaucracy a division of labour has developed between the officials responsible for industrial labour relations, whose work is mainly limited to visiting the establishments and industries within urban locations, and their colleagues who are almost entirely concerned with agricultural labour in the countryside. This exclusive preoccupation on both sides is not only detrimental to the interests of wage labour in the urban informal sector, but also produces a situation in which employment in large sections of the rural economy escapes any kind of official control. All kinds of activity outside agriculture, but still rural in nature, lie beyond the reach of the labour inspectorate, even where the law has declared a minimum wage for the work.

These are my first critical observations on the governmental claim that the special provisions introduced offer effective protection for the very large landless class in the South Gujarat countryside. Life in these households can only be understood by recognising that work in agriculture is only one of their sources of income and is far from always being the main source. For this reason alone, it would be better to talk of a 'rural' rather than an 'agrarian' proletariat. Certainly where Surat district is concerned, rapid economic growth goes hand in hand with a steadily increasing diversification of the rural economy as a whole.[2] It is clear from my current research into off-farm employment that the government has absolutely no interest in the labour relations prevailing in, for example, brickfields, stone quarries and stone crushing units, road construction, to name but a few of the employment sectors for which legal regulations have been in force for several years.

Admittedly, beginnings are never easy, and one could look on the situation of a separate inspectorate for agricultural labour as a promising step towards better control of labour conditions in the rural milieu. In that case I am all the more interested in the way this agency works and in the results achieved. With this in mind I have made repeated visits to the head office, and whenever the opportunity has arisen, I have gratefully accepted invitations to accompany the government labour officers on their rounds in the district.

We had already met several times before today's trip. Although this has gone some way towards allaying my companion's suspicions, he still does not quite know how to behave in my presence. I do my best to leave the initiative entirely to him, and show myself perfectly willing to follow in his footsteps keeping as low a profile as possible. 'Please go ahead and do what you would normally do, as if I weren't here.' My fellow traveller clearly has reservations about this; the idea that I shall be monitoring all his actions at rather close quarters for several days does nothing to put him at his ease. The tension never entirely disappears, although he becomes accustomed to my presence after a while.

Once on the road I ask him about the current wage rate in this prosperous area. 'Yes, well—it's somewhere around the official minimum wage, and at the moment that's nine rupees for an eight-hour working day, sometimes even a bit more in the peak periods.' My guide tells me that at present the farmers pay six rupees in cash, supplemented with two meals, or else seven or eight rupees with some food, a cup of tea, and a few cigarettes thrown in.

It soon becomes clear that these figures are incorrect, and in fact on this particular day we will not meet a single agricultural labourer who receives as much as he should for his work. In passing, it is interesting to note that in their first contacts with outsiders, labour officers tend to maintain that there is hardly any discrepancy between what is legally prescribed and what is done in practice.

## II

## Control among the Landless

The inspection has something of the nature of a raid into hostile territory. The GLO selects his clients at random, but those we stop on the road are seldom anything other than agricultural labourers. His long experience enables him to identify members of this class even at a distance. After first putting a few opening questions he makes himself known. 'I am the government labour officer . . .' As a rule those with whom he is talking do not seem to be very happy about the encounter. Any contact with a representative of the government, especially by the roadside, unprepared and outside any kind of a group situation, is best avoided. Still, most of them answer the GLO's questions meekly and to the best of their ability. The government official radiates authority in his bearing and gestures, and he acts in a manner calculated to compel respect. From the road he beckons to labourers working in the field. If they dawdle as they come over to us, he urges them irritably to hurry up.

Right from the beginning the conversation is conducted on a footing of inequality and takes the form of an interrogation. Sometimes the questioner turns abruptly to another worker, paying absolutely no further attention to his previous respondent. The vast majority of agricultural labourers say they earn five or five-and-a-half rupees, or even less if they are given a meal as well, Their accounts are invariably consistent with the data I collected during my current fieldwork in this region. The GLO never questions the information given, but now and then shows irritation if respondents are unable to answer any of his queries. Some cannot give the father's name of the farmer for whom they are working, while others do not have even the vaguest idea of their own ages or of how long they have been working for the same boss. Yet almost everyone can tell me exactly how much the official minimum wage is, whenever I ask this in the margins of our conversation.

At the end of every interrogation the GLO unceremoniously grabs each informant's thumb and presses it, inked, on to the completed form. Their illiteracy is taken for granted. Without another word, let alone with any kind of explanation to the labourers, the GLO gets back on his motor cycle. Yet not all of our respondents resign themselves to the confrontation so meekly. One boy herding a few cattle is so unnerved by the questions being fired at him that he takes to his heels after a few minutes. With one leap he is over the hedge and running away as hard as he can across the field without once looking back, escaping from his protector. It strikes me that the agricultural labourers who have had the chance to prepare themselves for the interview with us are somewhat more reserved about giving information, yet an answer that is obviously meant to be evasive is not necessarily less reliable, for all that.

Q How much do you earn?

A That depends on the season.

Q Yes, but what is the daily wage at present?

A Today I'm working on contract (*udhad*).

Q With which farmer?

A That depends. Sometimes with one, sometimes with another.

Q How many hours do you work?

A Sometimes from before dawn until after sunset, but sometimes only half day or no more than a couple of hours.

This kind of detail, although it gives a very realistic picture of the agricultural labourer's day-to-day life, is too complicated to be caught accurately in a straightforward questionnnaire. The GLO soon abandons his attempts to record this case. Without co-operation you can't do much, he sighs.

Farm servants in permanent employment are remarkably loyal to their masters. One of them, a tractor driver, gives the figure of 200 rupees for his monthly wage without realising that this is still less than he should be paid on an annual basis. Grumbling, he 'signs' his statement. He vainly tries to prevent us from questioning his co-driver by telling us that it has not yet been decided what this casual labourer will be given at the end of the day. Although I know that this is not unusual, the GLO refuses to accept the story and the co-driver, a seasonal migrant from another state who keeps silent because his Gujarati is not very good, also gets a summons. This is meant quite literally, because the way in which we are working unintentionally gives the impression that it is the agricultural labourers rather than their employers who are at fault. At all events, the reactions of the people we are interviewing foster this assumption.

After we have been on the go in this way for a couple of hours, my guide suggests that we visit the agricultural labourers in their own neighbourhood. The next village which we enter is in the centre of his official domain, but he tells me that he has never been into the slums where landless labourers live. Only the wife is at home in the first hut we visit. She says that she earns five-and-a-half rupees a day—when there is any work for her at all. Her neighbours' answers are no different, and the forms are filled in one after the other. When a respondent is unable to answer the GLO's question about age, a rapid glance suffices for a rough guess at this.

The arbitrary classification into a few age categories—twenty, thirty, forty-five year olds, and so on—that is found in so many government statistics, is taking place before my very eyes. We are sitting on the *charpoy* (a rope-bottomed bedstead), the only piece of furniture in this one-room dwelling. A government official definitely does not sit on the floor, eye to eye with his audience. Meanwhile the man of the house has arrived. After we have been through his own testimony, he is assigned the job of arranging for a steady stream of respondents from this locality. One by one they enter through the hole serving as a door and remain standing as they submit to the interrogation, then disappear again as soon as they have signed the form. In a few moments the GLO manages to create an office atmosphere in this small dark space, behaving like a senior officer summoning his subordinates before him to present their reports. No one dares to ask what all this is about.

Naturally, in the neighbourhood we are big news. The landless have assembled in small groups. No one dares to count on deriving any benefit from our presence. The majority of those talking it over afterwards think that the information they have given could well be used against them. After all, isn't that always the case? It is a rather disturbing prospect because who can afford to be marked down as a trouble maker? Others, especially the women, who are fiercer and more embittered than the men, reason that there is nothing to be gained by hiding the truth.

The hutment colony is rather crowded at this time of the day. The usual interruption in the work between twelve and two o'clock only partly explains this. Even if we were to come earlier or later in the day, we would find many of the landless at home. The peak period of the agrarian cycle has passed, and when labourers report for work early in the morning, at this time of the year (January) they are often turned away by the farmers, because there is no work for them to do. The casual labourers are told this, day after day in the quieter winter months. Moreover, it often happens that the local landless are excluded from the work which is still available. A large proportion of the cultivable land is planted with sugar cane, and the co-operative sugar factories have brought in a great number of labourers from far away for the duration of the harvest campaign lasting from the beginning of December until May. These migrants live and work in gangs. Their temporary camps consist of tent-like shelters made from a few woven mats; they are spread over the entire region and are a marked feature of the landscape around this time of the year. They will disappear again at the end of the cutting season.[3]

The sugar harvest workers constitute only part of the huge army of migrants. The individual farmers can also count on the labour of a great many additional workers, coming from other parts of the district or far beyond it, who have made the trek to the plain to profit from the plentiful supply of work in the peak period of the year. They move around in gangs of between five and twenty workers, both male and female. Many of them appear to have settled down indefinitely in the villages on the plain. Lacking dwellings of their own, they bivouac in the immediate vicinity of the farmer's house—in the compound, in the byre with the cattle, in the loft—where they are employed as farm servants or maids. The migrants who are given shelter in a pump house or a field shed far outside the actual village, remain completely invisible. The local landless trace a direct link between both their own underpayment and their chronic unemployment, and this reserve army of cheap labourers which has invaded the region in ever-increasing numbers over the past two decades.

Even though in principle the outsiders also fall within the purview of the minimum wage legislation, the government leaves them undisturbed and unprotected. However clear it may be that the arrival, temporary or permanent, of several hundreds of migrants in each village has sharply increased the vulnerability of the local rural proletariat, policy-makers and bureaucrats do nothing to put a stop to this influx of migrants. One of the agricultural labourers we are interviewing openly questions the point of filling in so many forms when nothing ever comes of them, and dares to suggest that we would do better to spend our time on the problem created by the presence of so many migrants. This persistance earns him a sharp reprimand from the GLO. How could anyone who is illiterate think of taking an official to task, telling him how he should be performing his job? It is obviously time to leave.

## III

### Visiting the Farmers

The GLO confides to me that in half a day he has filled in enough forms to complete more than his week's quota, and he suggests that we should pay a visit to the farmers in the village. He impresses upon me that it is unwise to place too much reliance on information deriving from one party alone. For the sake of objectivity it is necessary to get to know the other side as well, and develop understanding for the employers' viewpoint.

We go straight to the house of the village headman, whom my companion has already met on earlier visits. The sirpanch himself is not at home, and his wife invites us in, without much enthusiasm, to wait for him. A small boy is dispatched to fetch the police patel, who materialises a few minutes later and is given the task of bringing several farmers to us. The GLO reads out their names from the forms he has just filled in. We stay behind, alone, in our host's front room. The lady of the house returns to her kitchen, and neighbours who otherwise turn up very quickly when strangers are visiting the village, keep away on this occasion. Our halt at the landless labourers' part of the village, located on the outskirts, has not gone unnoticed by the employers. The identity of these uninvited visitors was undoubtedly conveyed to them while we were still talking to the labourers. The farmers can well do without a meeting, particularly as we have violated the unwritten rules by not presenting ourselves to them right at the beginning. Who is this official who has taken it into his head to overlook the landowning elite and to establish direct contact with rural poor, going in search of the landless who are hidden away in the inaccessible parts of the village?

To kill time I chat with the farm-cum-house servant who is bringing us tea and snacks. He is all praise for his master and begins to catalogue all the extras he receives. Besides the tea, and food that he is allowed to take home with him at the end of each day, he is also given old clothing and shoes, money for the doctor and medicines in case of sickness, or when his wife is giving birth, small loans when he asks for them, and so on. Nonetheless, calculating all this on annual basis, his wages and bonuses together still add upto less than the Rs 3,200 which a farm servant ought to be earning, in accordance with the minimum wage legislation. At this point in our conversation the GLO begins to fidget restlessly on his chair. He tries in vain to suggest that the employer might not be paying out part of the daily cash wage, but is keeping note of it as a balance in the servant's favour. On the contrary, quite the reverse is true; it is the farm servant who has been in debt to his boss for many years. I wonder out loud if we are not confronted here with a case of bonded labour, according to the letter of the law. The GLO hastily brings out a new questionnaire, to record this umpteenth case of underpayment—in duty bound to do so, even though we both know that he will do nothing further with it. Yet it is a painful moment to be enjoying hospitality. The lady of the house appears from the kitchen to ask indignantly what all this is about, and makes sure that the servant leaves the room.

After half an hour of waiting the police patel comes in, herding a couple of farmers before him like cattle gone astray. None of them is on the GLO's list. All the listed farmers just happen to be absent from the village today or have pressing business. However, the replacements the police patel has found are prepared to talk with us in a general way about government regulations on labourers' wages. In their view, this kind of interference has an absolutely negative effect on agriculture, since it is not the landless but the landowners who are the weaker party. It's a pretty upside-down world in which the government protects the worthless ones of society who have no sense of responsibility, rather than taking the producers' side. I suggest cautiously that nine rupees for an eight-hour working day is really not very good pay. It is barely possible for one person to survive on it, let alone to share it with the non-working members of a household, who also have to live. Two kinds of argument, mutually conflicting, are advanced against this view. In the first place there is the denial that labour is grossly underpaid. Totally at variance with the statements by agricultural workers with whom we have spoken, the farmers continue to maintain staunchly that the wages they pay do entirely conform with the legally prescribed rate. Admittedly, they do not give the full amount in cash, as the law says they should, but even the labourers themselves do not want this. If one were to add up all the payments made in both cash and kind, one would arrive at an even higher total figure than the nine rupees a day. They are providing their subordinates with nothing less than total care! In that case, why is it that the majority of agricultural labourers in this village are in such a miserable state, in spite of this guaranteed livelihood? Well, say the farmers, that is their own fault. It is what comes of immoderate drinking and other vices, but particularly of their refusal to work in the way they should.

And here we have the second argument heard among landowners in every conceivable variation. Whenever the agricultural labourers have to make ends meet on so little money, this is only the consequence of their own careless behaviour. You can never rely on them. A farm servant who comes one day, stays away the next day without giving any reason. Isn't it therefore logical that the farmers in their turn send labourers away if there is no need for them? Apart from the fact that they arrive late and leave early, it cannot be said that they work even reasonably well during the few hours they spend in the fields. They are always complaining; it is too cold on winter mornings, too hot on summer afternoons, and in the monsoon it rains too hard for their liking. Any employer who still pays the full daily wage is not only injuring himself but is also putting a premium on behaviour that cannot be tolerated. It does not help matters when I remark that it is strange to hear this censure of the labourers' boundless laziness from the lips of landowners. *Their* fathers were accustomed to working hard themselves on the land alongside their labourers, in contrast to the present generation, who shun any form of physical labour. My comment falls on stony ground with these members of the dominant caste in the region. Their prosperity and upward social mobility has been achieved to no small degree by exploiting their subordinates to the full and they have no qualms about their anti-labour stance.

The GLO has remained largely aloof from the conversation, but when he does join in, it is to supplement and illustrate the farmers' point of view. He feels clearly much more at home in these surroundings than he did a short while ago in the labourers' company. The attitude he adopts is that of an ordinary official who is only carrying out his superior's orders. Is it his fault if his instructions conflict with the big farmers' interests? To the latter he represents a government that does not have their interests at heart, yet they do not seem to hold this against him on a personal level. Where his social background and outlook are concerned, he shows that he is closer to the landowners than to the labourers. They tacitly appeal to him for approval, and he indicates cautious agreement with some of their rhetorical judgments by gestures of the hand or head.

What, for instance, is the use of ordering the farmers to keep records of the labour they employ? Inquisitively I ask one of them to fetch me his labourers' wage slips. He hesitates but finally gives in. The daily wage shown is invariably four rupees, for half a day's work according to his own notes in the margin. He is legally covered to the extent that he has obtained his labourers' thumbprints, but only the first pages of the book have been filled in, and the last entry is many months old. He has 'forgotten' to keep his administration up to date, he says with a challenging look in the direction of the GLO, who pretends not to have heard. Why should he spoil the atmosphere with formalistic objections? A fresh round of tea is brought in, and gradually the conversation moves on to other, less sensitive topics. There is no mention of any kind of infringement as we leave. We shall be most welcome to come again, and next time we must stay for a meal, and even stay the night if we can. The guest is king here, after all.

Our road out of the village runs alongside the hutment colonies of the landless, but this time we take no notice of them. Some of the labourers watch us from the door openings of their ramshackle huts, in silence. They know where we have been.

## IV

## The Due Course of Law

What happens next? In theory matters take the following course. The farmers suspected of infringing the law on minimum wages are summoned to the GLO's office. Even in the cases where this point is reached, no further action is taken. Largely due to the arbitrary way in which statements are drawn up, these often remain incomplete or incorrect. In theory it would be quite easy for an employer to dispute the legal validity of the complaint against him. Objections of this kind are nevertheless rarely heard, since it is always possible for the GLO to adjust the original statement. The farmer has to prove, by means of wage slips and a daily register of the labourers employed, that he has paid the minimum wage. If he is unable to produce these proofs, he is given the chance to reach an amicable settlement. When the inspector has listened to both sides he determines the arrears of wages due to the labourers over the foregoing period, for a maximum of six months, assuming a working month of twenty days. But when the farmer promises to pay the minimum wage in future and to keep a daily record as well he is allowed to go scot-free.

However, if the employer continues to deny that he had broken the law, or if he refuses to abide by the settlement reached, the GLO can file a suit, at all events where the labourer has not withdrawn his original statement in the meantime. The case now goes before the local court, which determines the sum that the farmer must pay the labourer. This includes a fine, which can amount to ten times the arrears of wages. As we can see from the Table, only in very exceptional cases does the GLO actually resort to prosecution, and of the cases actually brought against farmers, only a few reach the stage of a formal charge, and even then they seldom result in a penalty. In other words, the employer caught breaking the law runs little risk of having a legal case brought against him. There is even less chance that a labourer would have the opportunity of registering a complaint against the farmer. A total of 12,000 to 15,000 inspections a year (see Table) means that scarcely more than four per cent of the agricultural labour force in the district is approached by a GLO for the required information. Yet what can one official do in a *taluka* with twenty to thirty thousand agricultural labourers, sometimes even more than that?

Nevertheless the plea that more staff would be needed for enforcing compliance with the minimum-wage laws, simply does not hold water. It is not only the (assistant) GLO's who are officially authorised to inspect and prosecute. On the strength of a special clause in the law, various other officials in the district administration can also act as labour inspectors. These are the Deputy Collectors, Deputy District Development Officers, Mamlatdars, Taluka Development Officers, and Soil Conservation Officers. To my knowledge these bureaucrats seldom if at all exercise their right as law enforcement officers. The figures stated in the Table imply that out of every 10,000 agricultural labourers in South Gujarat, scarcely 250 are contacted each year. Only in ten cases out of this number is there a decision to prosecute, and of these no more than a single case is finally brought before the local court. There is a good chance that even this will end without a verdict being brought or sentence being passed.

To the picture that has thus far emerged, we must add that only a handful of employers comply voluntarily with the law on minimum wages. Underpayment is a universal phenomenon. Judging by my own data, the loss of wages per agricultural labourer per day averages two and a half rupees, even allowing for extras in kind, and the partial or total failure to repay money advanced. If one estimates the average number of working days in the agrarian year at two hundred, the labourers receives approximately five hundred rupees a year less than the sum prescribed by the government. According to my calculations, the landowning elite withhold 15 crore rupee a year from the landless class in the form of an extra-legal surplus. We would do well to bear in mind that although this sum is only a fraction of the bigger landowners' costs and ultimate profits, it constitutes a very substantial proportion of the labourers' total earnings. I would estimate that it amounts to between a quarter and a third of their annual income, a sum that makes the difference between the life of extreme poverty which for very many of the landless is something to strive towards, and their actual, utterly pauperised existence.

In view of this background it is hardly surprising to learn that the agricultural labourers benefit very little from the help the Government of Gujarat claims to provide so generously and determinedly. When questioned they answer candidly, although not with the intention of registering complaints against their employers. Experience has taught them that the chances of actually receiving the compensation awarded them are extremely slim. Furthermore, even if it were to reach them, it would count for little against the certainty of never again being offered work. Not only would the farmer sack the labourer concerned, but he would also not hesitate to turn the other landowners aginst him. There is no question of a right to work. However low wages may be, what is even worse for the landless than underpayment is that they are regarded as troublesome and unreliable, and are therefore no longer considered for regular employment. Although no one talks about it, the employers do maintain a blacklist. Anyone finding his way onto that list would do better to disappear from the village altogether, or at all events to look quite far afield for employment outside agriculture. Time and again GLOs assured me that fear of this kind of vengeance was the main reason why so few labourers are prepared to stick to their initial statements made in brief and surprise encounters. Only a few of them will continue to maintain that they are underpaid when confronted by their employers. Without a complaint of this nature there is no chance of a prosecution.

Most agricultural labourers have the courage to talk openly in the safety of their own localities, beyond the reach of the farmers' eyes and ears. Their account is always the same, as we are able to confirm later that day, while visiting yet another village. Serious underpayment, little work to be had, and this is diminished still further by migrants who are content to take even less wages. Maidservants in farmers' households constitute a separate category of workers. For several hours' work each morning—cleaning vessels, washing clothes, sweeping the house, cleaning out the byre and so on—they are paid only five to fifteen rupees a month in addition to a daily meal which they usually take home. The farmer's wife, who give orders to these maidservants, is often even more of a tyrant and skinflint than the husband.

For the first time we came to know about labourers who have already encountered GLOs. Their experiences have been anything but encouraging. An old man tells how, about a year ago, someone stopped him on the road to ask the same questions we are now putting to him. His questioner had told him that he would hear more about it. Did our visit have anything to do with it, and would someone else turn up next year too? Loud laughter from the bystanders. It is a barely veiled insinuation that all this nosiness never produces any results, not for the victims at any rate. Made bolder by this candidness, another labourer tells us how an official had taken his son's thumbprint. The boy herded cattle for two rupees a day. The farmer did not hold it against the son, but did charge him (the father) the sixty rupees that had to be paid to the

official to close the file'. Besides having his outstanding debt increased with this sum, he was also warned not to give information to strangers in future. He had learned his lesson.

Although many nod their heads in agreement, only a few prefer to remain silent. A labourer steps forward from the circle that has formed around us, complaining that he is being boycotted by the farmers. The master for whom he has been working for many years gave him to understand a month ago that he had to repay his debt of five hundred rupees. But he has never had such a sum in his life, so how could he consent to a deduction of one or two rupees from his daily wage of only six rupees? It is absolutely impossible to survive on even less than that. He never went back after that incident, but since then all the other farmers have refused him work. Out of necessity he is now going to a neighbouring village to hire himself out as a day labourer, but can nothing be done about what has happened to him? Perhaps influenced by the open criticism that he has just heard, the GLO spontaneously suggests seeking out the farmer in question and finding a solution to the dispute on the spot. This will also give me the chance to see arbitration in action.

The three of us get on the motor cycle, the labourer between us. Everything about him shows that he has little confidence in the undertaking once we are on our way. Arriving at the landowner's bungalow, he hides himself behind a parked tractor. He nearly creeps away altogether when urged to come inside the house with us and take a seat on the sofa in the front room. In fact he is not really expected to accept the invitation. It would be quite unthinkable for a labourer to enter the house in the company of people who are socially far superior to him. The GLO shrugs when I say that it might have been better to fetch the master to the servant, instead of the other way round. He would never think of such a thing of his own accord, and he does not want to hear of it from me.

Our appearance on the scene attracts a good deal of attention. The landowner is not there, but his wife says that he could be home at any moment. She takes the GLO on one side to ask him what is going on, and he tells her in a whisper. The neighbours, who are quick to make their appearance, also join in. They discuss the matter among themselves—the identity of the labourer involved in this business, and the pack of lies he has been telling us. His debt has reached five hundred rupees because he asked so often for the loan of small sums in the past few years. Isn't it true that the farmers have to pay back the money they borrow from the bank? Instead of being grateful to his master for giving him so much credit, something most landowners have been unwilling to do for a long time now precisely because they are afraid of bad debts, here we have a labourer who is insolent enough to complain when reminded of his obligations.

The line of argument has now been decided, and the former farm servant is called inside to listen to it. Although he is only one against eight or nine farmers, he defends himself staunchly. The ensuing dialogue makes it clear that a good deal of the money at the centre of the dispute was lent to him for medical treatment. The year before, he had become ill after spraying the standing crops with *deva* ('medicine', i e, a pesticide). The expenditure for treatment, some two hundred rupees, had been paid by his boss but only as a loan, as he found out much later. In view of the nature of his illness and its cause, he refused to accept this as a debt. After all, has he not sustained much greater damage than the farmer, since he received no wages in the weeks he was unfit for work?

At this point the GLO abruptly cuts the conversation short. He has just heard that the master of the house is in fact at a meeting, in his capacity as board member of one of the large co-operative sugar factories in the region. Suddenly he sees no further need to await his return or to continue this claim-and-counterclaim session. Even the suggestion that someone of this calibre might be guilty of labour malpractices cannot be entertained for a moment, and would certainly not be a wise course of action. Haven't I seen with my own eyes how difficult it is to obtain evidence one way or the other? In no time we are standing outside again. The GLO curtly dismisses the labourer he has dragged here virtually by the scruff of his neck. The man has to find his own way back in the dark, accompanied by some of his neighbours, who have been waiting for him. They ran behind us to the farmer's house, not unjustifiably suspicious that we would be unable or unwilling to protect their comrade in the confrontation awaiting him.

## V

## Official Mediation

Next day in an informal meeting at the headquarters we talk over these matters again. The official in question says that he is dependent upon the labourers' co-operation, something they are only willing to give where conflict is acute and has come into the open. And then one has to ask oneself whether the information they give is reliable. Don't the landless tend to exaggerate, on the other hand? His chief backs him up with the remark that there is great resistance to labour inspection. He leaves no room for doubt that this has a great deal to do with the attitude taken by the rural elite. If his staff were to keep to the letter of the law, they would no longer be able to go into the villages'. The dominant landowners would use violence to drive them out, if need be.

Statement of this kind throw the vulnerable position of the landless into glaring relief, and in fact the prevailing social climate is used in this way to excuse the ineffectiveness of government control. It explains the indulgent way in which GLOs turn a blind eye towards farmers' infringements of the law, such as failure to fill in pay slips or failure to keep a daily register of the labourers employed. For the same reason the inspectors are reluctant to press farmers to repay arrears of wages. The officials call this the room for manoeuvre necessary for persuading the employers to make concessions. What I would like to emphasise is that these officials are not implementing the law, only interpreting it. Although this agency has a mandate to enforce observance of the rights of the weakest party, he refuses to give the agricultural workers their due, unconditionally and systematically. Actually the GLOs claim to be impartial and to play a mediatory role between the two parties. It is arbitration that is considered important, rather than advancing the interests of those who are their real clients. The issue at stake is that this office, set up to provide a counterweight to the economic and extra-economic pressures exerted by the dominant farmers, in fact very often confirms the great and increasing inequality between landowners and landless, through its mode of operation.

While institutionally speaking an impartial stance has been adopted, the social background of the officers to whom the task of law enforcement has been entrusted inevitably tilts them further in the employers' direction. At one of the discussions at headquarters I ask an official for his personal views. It is no mere slip of the tongue when he begins saying 'we farmers ...'. Besides working for the government he also farms his own land in the area for which he is responsible. He is speaking from his own experience but most of his colleagues as well, when expressing their opinions freely, have a great deal of understanding and sympathy for the landowners' viewpoint. They have little insight into the landless labourers' existence, even though in their official capacity it is their main task to show concern for this. These bureaucrats may formulate their views in a more refined way than the average farmer but they have the same preconceived ideas about the utter worthlessness of most agricultural workers.

Does this class affinity mean that officials really behave as the landowners' allies, intent on causing them as little trouble as possible? To listen to the farmers, one would hardly think so. On the contrary, they are fiercely opposed to 'state interference', and subject visiting GLOs to a stream of criticism and reproach. Government intervention in labour relations is based on the premise that the rural order consists of two parties, employers and employees each with justifiable aspirations or even demands that have to be reconciled as far as possible, with the help of official mediation. However much distortion in favour of farmers there may be in practice, the terms of arbitration are based on the principle, firstly, that there is more than one interested party, and secondly, that an external authority is competent to settle the differences between the parties. The latter notion in particular irritates the landowners a great deal. In fact they will not tolerate the idea that the landless, whom they have dominated for many generations, can call upon the government for support. The fact that little ever comes of this in practice does little to diminish the landowners' displeasure.

The attitude adopted by the labour inspectors is one of understanding for the landowners' complaints but at the same time making it clear that, as officials they have to satisfy their superiors where both inspections and prosecutions of defaulters are concerned. They hint, however, that something can be done about the latter. Farmers who are called to account on a labourer's statement can buy their way out of trouble. What this really means is that inspectors can use the discretion with which they are officially rested to make money. Rather than being *anti*-labourers or *pro*-farmers, they act largely in their self-interest.

It is one of the many examples of privatisation of public function. The proceeds of this conversion are often greater than the formal salary. This is also the reason why quite a high sum has to be paid for appointments to a post offering prospect of generous 'earnings' on the side. The market mechanism is not limited only to the sphere known as free enterprise, but extends to the state apparatus. There are more inspections made by GLOs than are found in statistics, and more questionnaires are filled in than are included in the monthly report. For the officials in charge, a proportion of these constitute the working capital for their own extra-public operations. Obviously I have not been able to follow close at hand the negotiations with employers, with a few exceptions, but several of my informants among the landowners have talked very frankly about the price they have had to pay to save themselves from prosecution.

Such practices as these reinforce the farmers' negative image of the state bureaucracy. It reinforces their dislike of a useless government that battens on their pockets. Yet in the last analysis it is the landless who are the real victims, since the bribe is always less than the wages withheld from the latter. Even the labourers know quite well that the statements they make are often used for the purpose of extorting a bribe. Some of them were able to tell me exactly how much their employers had paid in hush money, sometimes only an hour or two after they had been obliged to set their thumbprints on paper. It is one more reason why labourers, when approached by GLOs, are not very forthcoming with information.

We have associated the official inability to offer adequate protection to the rural proletariat, with the powerful position of the large-landowner class on the one hand, and with the failure of the agency entrusted with providing that protection on the other. The fact that wages lag far behind the legally prescribed minimum results from the huge supply of available labour, partly from the region itself but supplemented by migrant workers. The farmers' dominance in a non-economic sense as well, adds yet another dimension to the problem of the agricultural labourers, the essence of which is that there are simply too many of them. They have no bargaining power whatsoever. Under these circumstances, so the excuse always runs, a government can do little more than establish a norm by fixing a price for labour, in the hope that this will be accepted as quickly and completely as possible. The question of why so little ever comes of it can be disposed of by pointing to class bias and bureaucratic corruption. Yet in my view resistance by dominant forces in society combined with official misconduct fall somewhat short of providing a complete explanation for the ineffectiveness of government action. One must also analyse the broader economic and social context of which policies for the protection of labour form a part.

There can be no doubt whatsoever that a strategy for capitalist development is being followed and promoted in Gujarat. Slogans and advertisements aimed at enticing entrepreneurs and capital to the state, enlarge at length upon 'the favourable labour climate'. Formulated in a more straightforward way this means low wages and lack of labour unrest, an attractive combination for employers from Bombay, for example. The point I want to make is that a policy in which labour is systematically subordinated to capital allows little room for manoeuvre to an official agency commissioned to compensate the agricultural workers in some measure for their acknowledged inferiority. This handicap can never be overcome even if officials were prepared to range themselves solidly behind (or better, in front of) their clients, rather than being inclined to use the law to fill their own pockets. Such an agency is, like other branches of the government bureaucracy, part of a state order that shows little real concern for the conditions of the rural proletariat. When the minimum wage was raised on an earlier occasion, a minister who came under fire from an audience of landowners while visiting a village in Surat district, told them plainly that some laws were never meant to be implemented. At the very moment he was making this statement in one part of the village, agricultural labourers in another part who seized the opportunity of the bigwig's visit to press for the payment of the new rate, were beaten up by farmers' sons for their insolence. The resulting police case was shelved and nothing more has been heard of it. In the light of such remarks and incidents involving leading politicians, it would seem sensible to tone down strictures on the culpability of government labour officers.

There is another example from which one could conclude that failure to protect the most vulnerable in rural society is connected with forces at work in the political arena. This is the refusal to apply the minimum wage law to the army of sugarcane cutters, who each year are brought in from far away by the co-operative sugar factories in South Gujarat, to work throughout the campaign. Once the government came to know of the conditions under whcih they were working, it was no longer possible to remain aloof from the problem.[4] Here was a clear case of across-the-board infringements of formal regulations. The co-operative factories, belonging to the bigger landowners, were guilty of underpaying harvest workers on a truly massive scale; they did not abide by the regulations governing the use of contract labour; they ignored legal restrictions on inter-state labour migration.

For the sake of brevity I shall only take up the first point. Several seasons ago a committee in which the government was also represented, fixed the harvesting rate at eighteen rupees a tonne. Since this is the exact amount that a work team (*koyta*), consisting of a man and his wife or any other pair, is presumed to be able to cut in one day, the committee's obvious objective was to raise wages to the legal minimum. This decision was acclaimed as a considerable improvement, right up to the highest bureaucratic and political echelons. Yet this is a serious misrepresentation of the situation. Firstly, most harvesting teams consist not of two workers but of two-and-a-half to three, that is, a man and wife and a child aged between ten and fifteen years, who has to work along with the adults. Secondly, a work team usually cuts only two-thirds to three-quarters of a tonne in a day. Thus earnings for an extremely heavy workload, often requiring a return to the fields in the night hours in order not to interrupt the flow of sugarcane to the factory, remain far below the officially prescribed rate. The policy-makers' ignorance of these practices is no excuse. As I have been able to confirm, they are perfectly well aware of what is going on, but they shut their eyes in order to maintain the fiction of compliance with the legal regulations.

Yet where these agro-industries are concerned it would be quite easy to implement the labour laws. We are dealing here with a large-scale, well-administered, and extremely profitable sector of the rural economy. There are none of the organisational difficulties that beset GLOs when they are inspecting the thousands of separate farms that employ agricultural labourers in limited numbers and often on an irregular basis. Nevertheless, governmental control in what can be called the formal sector of the rural econony appears to be essentially just as ineffective. The cause lies not in the system of labour inspection but, as the official in charge confided to me, in the institutional inability of the agency to resist the political pressures from the strong sugar producers' lobby in the state.

The bigger landowners realise that they form a class in itself and have united into a powerful farmers' alliance based on that consciousness. In the past this Khedut Semaj gave particular support to the political opposition, but its dominance is also acknowledged by the ruling Congress Party. Yet it would be wrong to see the public stand taken by the alliance simply as an extension of the established political parties. Right from the time the Khedut Semaj was set up at the end of the 1950s, it has taken a strongly anti-state line, to which a new impulse has been given by an agrarian producers' movement that has recently been spreading very rapidly from Maharashtra over the whole of western India.[5]

In contrast to this mobilisation among the rural bourgeoisie, the landless are still hardly aware of their class identity. Soon after Independence an organisation was set up under the direction of Gandhian social workers for the uplift of the particular tribal caste in South Gujarat to which the vast majority of agricultural labourers in the central plain belong. Imbued with Gandhian ideology, this Halpati Seva Sangh has focused particularly on welfare and educational activities. The efforts of the staff, mainly members of higher castes, have been directed towards training their clients to be better Hindus. Hardly any economic demands are made on behalf of the landless and consequently agricultural labourers were passed over when land reforms were implemented in the region between 1950 and 1970. In the ensuing years, the HSS has mounted no campaign for better wages on behalf of its clientele. Whenever labourers have engaged in local action on their own initiative, calling a strike for instance, the farmers have quite frequently enlisted the aid of Gandhian social workers in ending the agitation. My sketch of the HSS in an earlier publication[6] is still valid, but in the meanwhile the main leader, who himself comes from the class of dominant landowners, has completely lost his hold over the members of this caste of landless. There are still a number of government subsidised activities, but these are very routine in nature and have hardly any impact.

Besides the HSS, an urban politician in Surat has in recent years set himself up as the agricultural labourers' champion. Rather than operating from within a regular organisation, he holds regular meetings that constitute a barometer of his popularity. He is notorious as an outright opportunist who frequently changes political sides and who is on the lookout for a vote bank for whom he can act as a broker in the political arena, mainly with the intention of furthering his own interests.

The aim of the above discussion has been to emphasise the fact that the landless labourers among the working population of rural South Gujarat, forming the largest class, still lead an extremely fragmented existence in social and political terms. The immediate result is the absence of a counter-balance to the landowners dominant position. In the implementation of agrarian policy the agricultural labourers' interests—employment opportunities, earnings, access to public facilities—carry no weight. Their presence in large numbers is even defined as being counter-productive for society at large. To the extent that the labourers have anything at all to do with government, they come in contact mostly with the officials and agencies charged with keeping this class under control (for instance, through family planning) or even with 'conditioning' them in the negative sense. Police behaviour is a telling example of the latter. Finally, since the labourers lack their own organisations, especially trade unions, state personnel at local level are under no pressure to apply official rulings in an impartial way, and to give the labourers even their minimum legal rights.

## VI

## The Government in Action

It is quite openly acknowledged at higher state levels that good intentions, even when converted into concrete measures, have no effect because the proletariat totally lacks the ability to defend itself. The formal reasoning is that official intervention can achieve little as long as landowners continue to evade regulations and the landless are unwilling to complain about it. In 1982 the government in Gujarat set up the Gram Majur Kalyan Kendra (Rural Workers' Welfare Centre) in an attempt to create a counterweight. There was a double aim in this: firstly, the creation of a local platform for all kinds of special social-economic programmes and facilities for agricultural labourers; secondly, to motivate this target group to make use of whatever was offered to them from above.

Briefly, the train of thought behind this objective is as follows. The amorphous mass of landless live in a state of apathy. The misery of their existence derives from their ignorance and, more particularly, from their unfamiliarity with protective and corrective government measures. The absence of social consciousness prevents them from uniting to find their strength in mutual co-operation.

I shall come back to this definition of the problem in terms of a culture of poverty in the final paragraph. First I want to discuss the impact of the action centres set up for them. Has this experiment been successful?

The new approach is still in the trial stage, currently extending no further than one village in every taluka with at least 10,000 agricultural labourers. Thus the programme reaches only a fraction of the households qualifying for it. The Rural Labour Commissioner has been given the responsibility of organising and supervising the programme. While travelling round the South Gujarat plain with officials from this agency, I had the opportunity of visiting one of these centres, quite close to Bardoli.

It is already late in the afternoon when we reach the village. The place in which the centre is housed is locked up, but a startled office boy (peon) opens it up for us. The Rural Organiser who had assumed would be sitting in the centre, has to be fetehced from his home. He has been selected for this post from among a large number of candidates, all unemployed youths with schooling, and owes his appointment to the fact that he belongs to an untouchable caste, which gives him a head start in obtaining a government job. He is considered to belong to the actual target group and receives only a nominal sum for his efforts, yet the monthly Rs 400 he earns is far higher than the agricultural labourers' wages, whether actual or theoretical. Supposedly one of them, someone who acts as their spokesman and champion in the outside world, he behaves in fact as a government agent, the lowest in the hierarchy of officials whose task it is to maintain contact with the landless. The Rural Organiser is assisted by a child minder (ayah) earning Rs 100 a month, and an office boy (peon) who is paid Rs 50 a month. Only the latter comes from among the landless labourers.

What are the duties of the Rural Organiser? Not many; in fact so few that one can hardly talk of a regular daily work routine. He is somewhat nonplussed at my question about the work he actually does. 'The organising of sports and games for labourers in the village', says the instructions, which we all read together. Even his boss, the official accompanying me, jokes about this. No, very little comes of this, it is true. Stacked in his office there are a few cooking pots and pans and other kitchen necessities, which poor households in the village may borrow when there is a wedding feast to prepare, for instance. There are also a few musical instruments for the religious song gatherings called *bhajans*. This equipment is covered with a thick layer of dust, suggesting that it is used infrequently. In contrast, there is no sign of the reading materials with which the centres are provided to help labourers to keep up to date with what is going on in the wider society outside the village. In view of the high incidence of illiteracy, newspapers and magazines would in any case only be accessible to a handful of the labourers. Neither is there any adult education; the evening classes mentioned in the programme of activities are not in fact held, due to lack of interest, the Rural Organiser tells us. From the records he keeps it appears that between 40 and 50 toddlers come to the centre every day, where they are kept amused for a few hours and are given a meal by the ayah. This ostensibly costs Rs 500 a month. If it is prepared at all in the quantities suggested by this sum of money, the food certainly does not reach so many children. There is nothing to show that the building serves as a social meeting place for women or youths. This disposes of leadership training and promotion of communal feelings.

A handful of landless in the village have been given loans to enable them to find livings outside agriculture. In 1983 members of 22 households received an average sum of Rs 1,000—part loan, part subsidy—with which to buy carpenter's or mason's tools, fishnets, a sewing machine, axes and saws for wood cutting, a buffalo or goat, a handcart or bicycle for hawking vegetables, or to stock up a roadside stall, and so on. When I came back to this village a few weeks later and this time on my own, I tried to verify the use made of these loans. In only a few cases was I able to track down the tools or other means of production that had been purchased with loan money. Even then, the recipients quoted markedly lower figures for the sums received than were recorded in the Rural Organiser's account books.

At the time of my research in Gujarat, the state government mounted a publicity campaign drawing attention to the progress the state had made in the agrarian sector, including the introduction of life insurance for agricultural labourers, in mid-1983. For a premium of five rupees a year, agricultural labourers' relatives are entitled to Rs 2,000 in the case of a fatal accident, and Rs 1,000 where the labour has died from natural causes. The actual premium is ten rupees a year, the government making up the deficiency. The proud advertisement suggests that this group insurance scheme is unique and is being promoted in a big way.[7] The reality in Surat district, where the scheme was first introduced, tells us something different. In the centre I am visiting, the number who have taken out insurance under the scheme over the previous year has remained confined to scarcely 300 labourers spread over six villages. This represents only a tiny fraction of the total landless population, and even then they have often only joined the scheme because a sympathetic farmer has been good enough to pay the premium for his farm servants. Few of the rural poor are able to set aside as much as five rupees for this purpose. Finally, I have never found anyone receiving the monthly payment that, according to a new regulation, can be claimed by the aged and by those labourers declared physically unfit for work.

In the first report on the action centres, it is admitted that upto now the work has been mainly devoted to welfare, with the aim of developing social consciousness, and that there have been few tangible results to date.[8] The intention is to shift the emphasis gradually to objectives of a more economic kind and at the same time to make a start with more socially sensitive tasks. The Rural Organisers are supposed to play a crucial role in this, uncovering and rectifying abuses in the treatment of rural labour. They will be expected to inform both landowners and labourers about the law on the minimum wage; to persuade farmers who continue to underpay their workers that they should fall into line; to show concern for migrant labourers and to prevent them from being exploited; finally to summon any employer using sanctions against labourers to break their resistance.

With all this at the back of my mind I ask the Rural Organiser in the centre how much labourers in this village earn in a day. 'Nine rupees' he answers without a blush, and continues to maintain this even when I express doubt. Given his role of local government representative, what else can he say? He is only prepared to amend this figure, cautiously, when his boss intervenes to make it clear that we know better, after talking with labourers of various neighbourhoods in this village. After much hesitation, he gives the figure of seven rupees. After a further exchange in which we establish that even this sum is much too high, he leaves it to us to find out the extent of underpayment. What good does it do to bring all this into the open? He cannot tell us even approximately how many landless labourers' huts there are in the village, where the migrants are staying, how much they earn, and so on. The Organiser ought to identify himself strongly with his clientele—this is at least the underlying assumption of the programme—but he quite clearly feels himself to be a cut above them, because of his middle-school education (twelfth standard failed). It is absolutely naive to think that this young man would want to, or dare to, teach the farmers their legal obligations, perhaps hauling them over the coals and ultimately making complaints about them to the authorities. I would not count on the likelihood of a contest with the landowners initiated by the government. Official publications talk of training for responsible leadership and only permit social action regarded as 'constructive'. It seems to me that a far more important function of the action centres is to keep the growing tension in the countryside within bounds and to provide politicians with a platform that will facilitate communication with the landless, who constitute a sizeable vote bank, without conflicting with the first objective. The centres serve as checkpoints for the allocation of all kinds of benefits and facilities (including loans and subsidies, regular jobs, materials for building huts, admission to education or vocational training) to a small vanguard among the landless who have some influence in their own neighbourhoods. It is possible to recruit an even bigger following through these rank-and-file leaders, who naturally also profit to a disproportionate extent from whatever comes up for distribution. Government programmes such as IRDP and Tribal Sub Plan provide the financial means for this type of public expenditure. Are these 'loan *melas*' the enormous waste of money that some studies seem to suggest? The donations are enough to secure political allegiance, even if they fall short of bringing about genuine structural change. This, in any case, is not the ultimate objective. There is a knack to acquiring ever more new sinecures with which to mobilise and consolidate political support, especially at election time. Thus there will be soon a further rise in the minimum wage for agricultural labour, if only because statistics produced by government agencies show that nine rupees is no longer enough to fulfil basic needs because of the continuous rise in prices. Naturally, the introduction of the new rate does not mean that it will be put into practice.[9]

Policy on landless labourers can be summed up as one of accommodation, but does this strategy work? And if so, for how much longer can it succeed?

## VII

## Acute Confrontation

There has been a sharp increase in rural labour unrest in recent years, not excluding violent conflicts. There was a clash between landowners and landless in this village shortly before the Rural Workers' Welfare Centre was opened. When the landowners ignored the labourers' protests at the preferential treatment shown to the migrants who have settled here in large numbers, small 'incidents' escalated into a full-scale fight. I have not been able to uncover exactly what had happened in this case, but the mood on both sides is one of undiminished aggressiveness. What has struck me forcibly is not so much the farmers' intense enmity towards labourers (I have become accustomed to this) but the labourers' strikingly militant attitude. These outbursts are spontaneous, highly localised, and of short duration, but their increasing number and seriousness is indicative of an acute intensification of rural class antagonisms. To gain a better insight into this escalation, I paid as many visits as possible to villages in the plains where conflicts of this kind were taking place or where they had occurred sometime before. The way government intervened in order to defuse tensions provided a recurring focus of attention in the course of my fieldwork.

Accompanied by a GLO, I spend an afternoon in a village where a longstanding quarrel had ended in a bloody collision a few days after New Year (1985). The village centre where the farmers live is rather deserted. Many of the houses are shut up, and our reception by the remaining residents is lukewarm. They have little reason to be well disposed towards the GLO, since the official sent to the village as soon as news of the conflict became known, served a summons on thirty-three farmers for their failure to comply with the minimum wage law. With this charge hanging over them, few of the landowners see any point in talking to us. The telling of their story, little by little, does nothing to lift the mood of depression. Nine farmers are in hospital, five are in prison. Among them is the son of one of the men with whom we are talking, arrested under suspicion of having used a firearm. The cause of all this was a disagreement starting more than a year ago with the labourers who keep buffaloes. All of them landless, they depend on the village waste for grazing their cattle. They also took them into the farmers' fields without asking the owners' permission, and they were even stealing their crops. The farmers' response was a collective contract made with six field guards (*zim rakha*), strongmen who have come to the village to safeguard their property.

These tactics seem to have been very effective but the labourers, angry at once again having received the dirty end of the stick, went on strike. They would have nothing more to do with the local landowners, and set out each day to look for work in neighbouring villages. This was a nuisance for the farmers but no unsurmountable problem, because a sufficient number of labourers from outside came to the village once they heard about the dispute. The new equilibrium had been disturbed several months ago, when the outside labourers stayed away after being threatened by the local landless. The farmers reacted by intensifying surveillance of their fields and crops so that it became increasingly difficult for the landless to find enough forage for their cattle. Tensions rose still further towards the end of the year, when the current village head, a member of the landless caste, was defeated in the local elections by the farmers' candidate. In order to win, the latter had struck a deal with the village's Harijan households, the price being favours and benefits for these small or marginal landowners. The price was not too great for the bigger farmers from the dominant caste. They felt it was high time that the landless—definitely in the majority, with two hundred households—were pushed back into the lowly position they have always occupied.

Exactly two weeks ago, the bomb exploded. In the evening the field guards apprehended several landless-caste youths in possession of stolen goods. There was a free-for-all fight and farmers who joined in were barely able to prevent the battle from shifting to their part of the village. Fierce blows were exchanged and, although it was some comfort to the farmers that there were higher casualties among their opponents, they were nevertheless shocked that the landless had dared to fight them at all. The labourers even came perilously near to entering the farmers' streets. Rather than keeping this rabble on a tight rein, the government seems to be looking for a compromise, which will be binding on the employers as well. The farmers are very angry about this, and their wrath is vented on my companion. The politicians, even more than the officials, are being made to suffer. Previously the landowners were allowed to manage their own affairs and there were peaceful labour relations in the village. In a milieu like this, one always hears the complaint that politicians are stirring the agricultural labourers up against the farmers. Jinabhai Darji, who belongs to South Gujarat where he has a large following among the rural poor, is the biggest villain of all in the farmers' eyes. He is reported to have said in a meeting held in the labourers' colony during the national electoral campaign a few months ago, that he would be overjoyed at the death of five members of the dominant caste in every village. The GLO does nothing to contradict this kind of insinuation and maintains a meaningful silence whenever the charges become more heated, and extreme. But casual remarks make it clear that he agrees with the general opinion that politicians create incidents of this sort and do nothing to solve them. But his attitude of detachment does not convince all those present. From a distance our conversation is frequently interrupted by a landowner who has refused to join us. Sitting in front of his house across the street, he makes the sarcastic comment 'Don't bother to talk with these guys, they twist everything we say and then use the information against us'. The atmosphere remains strained. After a while the GLO has said everything he wants to say and asks if there is a TV set. The England *versus* India test match is on, and he wants to catch up with it. The only man present who has a set at home is not in the mood for a social visit. He has not watched the TV himself for the past few weeks. How could he do so when his neighbours are in hospital or prison?

The official has the stronger will, though, and soon we are comfortably installed in front of the TV screen. After a short while I suggest that it might do no harm to go to the hutment colonies and talk with the labourers as well. At this, the farmers and my companion all look askance at me. We have already heard and discussed what happened, haven't we? But when I insist, the GLO opts to go with me. Better that than letting me out of his sight in a place where anything might happen, and in fact has happened. As soon as we enter the part of the village where the landless reside we are stopped by a member of the Reserve State Police from the contingent camping here since the disturbances. Five of them are housed in a hut, out of which the occupants had to move to make room for them, and five more are in another labourers' colony. No, they have not been quartered on the farmers. Their orders are to keep an eye on everything the landless do. These have kept in the background since our arrival, although they are not intimated by our presence. When we want to make contact with them, they listen to us, not afraid but certainly in a tense and defensive mood.

Their version of recent events differs significantly from what we have heard from the farmers. A couple of youths on their way home on that evening had been beaten up by the field guards for absolutely no good reason. These landowners' mercenaries who had waylaid them sheered off when other labourers living nearby hurried to their rescue, but the next evening they returned with a large number of farmers who had even driven their tractors to other villages to call up reinforcements. Over a hundred men had begun lashing out at the landless with sticks and sickles and knives, making no distinction between young and old, men, women or children, and had wreaked a great deal of havoc in the landless quarter. Some of the farmers' sons had even used firearms. Dozen of the landless were wounded, some of them seriously, and next day the police had arrested a few of them. Apparently you are not even allowed to defend yourselves any more. An elderly woman shows us a huge wound on her upper leg, inflicted with a farming implement. One of her sons had both arms ripped open and is lying at home now, swathed in bandages up to his armpits. Her second son was taken away by the police, and there is no one left in her house to provide for the family. We walk past huts with their doors kicked in or with their roofs torn apart. Nevertheless, the attackers have not been completely blind in their destructiveness, since the homes most heavily hit are those belonging to the recognised leaders among the landless labourers. Little remains of the former village headman's hut, which you can see right through. I ask him if any of his possessions are missing. No, he answers, but then there was nothing to steal in the first place.

We hear a different story about the background to the conflict, as well. The labourers insist that they graze their cattle only on communal ground, which is after all open to everyone. They cut grass for fodder only along the public road and further point out that, over the years, the village waste has steadily decreased in size. Farmers appropriated some of this area when the coming of canal irrigation made it profitable to level off fallow lands and prepare them for tilling. The labourers say it is not they but the landowners who are the thieves, in extending their property in such an underhand way. Where outside labourers are concerned, there was of course some resentment over these blacklegs, but the local landless labourers piously deny that they have ever used threats to keep these busy-bodies out of the village.

The field guards are the main source of grievance. These farmers' mercenaries terrorise the labourers to the extent that women and children hardly dare set foot outside their own neighbourhood for fear of being raped or at least molested. Incidents of this kind have become familiar here, just like elsewhere on the plain. In the past, local watchmen were chosen from the ranks of the landless, and were paid from the village funds. The farmers put an end to this custom several years ago, dismissing the old watchmen and appointing new men in their place, toughs from outside the area. Even in this, the dominant landowners make it clear that they prefer to to deal with aliens. They refuse employment to the labouring households of the village, yet at the same time deny them access to alternative income opportunities.

The landless admit that they lost the elections for the village panchayat; the farmers bought the votes of the Harijans and even of a minority among the labourers themselves. Yet the Congress Party's huge success in the national elections in December 1984 boosted their morale. They were voting not so much for the majority party as against the opposition supported by the farmers, who are very angry about the election results. That anger has undoubtedly contributed to the violent turn taken by the conflict.

The GLO is intent on a compromise and he tries to make room for this in our conversations with labourers, who do in fact listen to him when he advises them, in a paternal manner, not to force the issue. Their spokesmen say that they are prepared to resume work at the old rate of five-and-a-half rupees. It does not even enter their heads to demand the minimum wage. In the neighbouring villages to which they have scattered in search of work, they are only given five rupees, and by making this concession they hope to be able to once again to collect firewood and to cut grass for their buffaloes or goats, without retribution. Many of their animals have already fallen sick or have died from lack of fodder, and there is nothing else to do except give way. In the circumstances the best solution would be a return to the old state of affairs, but there is one thing over which the labourers will not yield an inch—the *zim rakha* must leave the village.

We carry this message back to the landowners' quarter. The GLO is rather pessimistic but thinks that something might be achieved by offering the farmers exemption from legal proceedings over their infringements of the minimum wage law. This concession, together with the labourers' offer to return to work on the old conditions, might be attractive to the farmers, who indeed listen attentively. Yet as soon as the matter of the *zim rakhas* is raised they become intransigent, branding the labourers as the aggressors. Surely recent events have shown quite clearly that the farmers' safety depends entirely on the presence of this private police force, commanding respect in a situation in which anything may happen at any moment. We leave the village without having effected a compromise.

Several days later there was a newspaper item about a deputation from the Khedut Semaj from Surat district to the Home

Minister in Ahmedabad to lodge a complaint about recent incidents. The delegation includes farmers from villages in which there have recently been violent clashes. It is all the labourers' fault, but the government does not escape lightly either. The trouble the farmers have been experiencing stems directly from the agricultural labourers' purchase of cattle with government money, something that should never have been permitted, because people with no land of their own cannot afford to keep cattle. Out of sheer necessity the farmers have had to bring in their own corps of security guards to stamp out the theft of grass, sugarcane, and other crops from their fields. In villages where the landless have been slow to learn their lesson, there have been fights, sometimes with regrettable results. District authorities are lax in dealing appropriately with trouble-makers, and instead of clamping down on those labourers who have been driving hard-working migrant workers out of the villages, officials have been putting pressure on farmers who do not bother to follow useless regulations. Priority must be given to protecting farmers' property because this is also in the state interests, involving as it does the safeguarding of agrarian production. Further escalation of the situation can only be avoided by mounted police patrols of the rural areas, so the argument goes. According to this type of information published in the local press, law and order itself is hanging in balance.[10]

## VIII

## The Biased State

Landowners in Surat district tend to take the law into their own hands, apparently no longer acknowledging the state's monopoly of violence. This is suggested both by the increasing number of firearms licences issued (although I did not succeed in obtaining more detailed information on this) and by the hiring of *zim rakha* to protect the dominant farmers from the demands and attacks of the maligned landless. Little is known about the background of these hired thugs; the only point upon which everyone is agreed is that they are Muslims, a derivation also suggested by the name of *khanamia*. According to some, they come from the border area between India and Pakistan, where they are usually occupied in smuggling and other illegal activities. The majority probably originates from Jambusar taluka in Broach district, where they are regarded as descendants of *gariasias* (Rajputs) who converted to Islam in the eighteenth century. This information indicates a feudal warrior tradition now carried over into a capitalist context. The *zim rakha* are generally young men of above average height and sturdy build, whose material appearance is emphasised by the weapons they carry—cudgels, knives, and occasionally firearms.

Their leaders operate from urban bases in the region, where they have established a loose foothold. The farmers contract with them for the protection of their property, each village obtaining the services of upto six *zim rakhas* for a sum of Rs 30,000 and 50,000 a year, divided proportionately among the landowners. Part of the agreement is that the leader will, whenever necessary, increase the size of the group he has stationed in a village. Flexibility is a striking trait of these gangs' organisation. When workers from the main sugar factory in the central plain went on strike for a short time last year, *zim rakhas* from villages in the area were mobilised to come and break up the strike. Upto now the law-enforcing authorities have been passive in the face of this competition from private quarters arguing that no one can be forbidden to protect his own property. They prefer to turn a blind eye to infringements of the law accompanying this protection, or to treat them as unconnected incidents when they are actually brought to light. The official reticence should be understood against the background of the links that exist between criminal elements and the aggressive behaviour of pressure groups in the political arena. The social and economic dynamics in rural areas creates a breeding ground for the violence that has come to permeate political life. The fierce antagonism between landowners and landless labourers in Surat district offers abundant proof of this unwholesome trend which also reflects the situation in many other parts of India. Over the past few decades a class of dominant farmers has arisen owing its economic success to land reforms combined with agrarian modernisation. Politically, these farmers behave as a strong lobby prepared to buy, with money and/or violence, the means necessary to strengthen their bargaining power. Although there is more publicity about the extra-legal 'black' economy in urban areas, that of the countryside is just as extensive and active. It would be interesting to investigate whether the political forces underlying this illicit circuit are tending in the same direction as in the cities.

The state does not remain aloof from the struggle between the top and bottom of the rural order. The bureaucrats, both at the district level and above, seem to acknowledge the hegemony of the bigger landowners over their immediate environment. The attempt to soften the misery of the landless labourers' existence is the only governmental modification of this hegemony. To avoid the inevitable clash or prolonged class war that a change-over to a more equal and just society would imply extra facilities and special privileges are granted, based on the assumption that the weaker party's gains is not necessarily the stronger party's loss. This strategy suggests that in a state of expansion, part of the gains can be set aside and apportioned to those segments of the rural population who have fallen behind in the development process.

However, even this purely remedial

APPOINTMENTS

**Institute of Economic Growth,**

University Enclave

Delhi - 7.

Applications are invited for the post of a Professor (scale Rs. 1500-2500) in Investment Planning and Project Evaluation. Candidates with Ph.D. in Economics and substantial published work of high quality with teaching and research experience of guiding research at doctoral level or an outstanding scholar with established reputation who has made significant contributions to knowledge in the area may apply.

It will be open to the Institute to consider the names of suitable candidates who may not have applied for the post.

Applications with curriculum vitae should reach the Director by 31st July, 1985

Director

policy arouses opposition because it lessens the beneficiaries' dependence on their opponents. What one side calls the mitigation of deprivation is seen by the other as an attack on the existing social framework, or even as a downright conspiracy to create a new social order. Viewed in this light, we should understand the landowners' exasperation over the loans made to landless labourers for the purchase of cattle, the allocation of land and provision of material for the construction of better huts, the institution of crafts training courses, giving access to off-farm employment, and similar measures. Yet these correctives are too marginal to bring about any real structural change; they remain half-hearted attempts that bog down in corruption and inefficiency. Even the limited resources made available each year for this kind of programme are not exhausted because of apathy among the agencies involved in combination with obstruction from vested interests. The officials in charge have an entirely different explanation for this failure to reach the target group saying that the landless labourers turn down the opportunity for self-improvement when it is offered. Lack of interest among those eligible for such governmental aid is, according to them, the main factor. They are in fact describing a culture of poverty, a mentality that imprisons their clients in ignorance and apathy. This is also presumably the reason why agricultural labourers do not insist on implementation of the minimum wage legislation. Their argumentation continues along the lines that only edcuation and conscientisation will lead to a widening of social horizons and can break down inertia in the milieu of the downtrodden. This was the stand adopted by several high-ranking officials from the Central Ministry of Labour in Delhi, during a conference on bonded labour in Gujarat, held in Ahmedabad in mid-January 1985. Statements that emphaise the landless labourers' indifference and docility in fact confirm the idea that the rural poor themselves are primarily to blame for their present situation.

This is a gross distortion of the truth, since militancy, rather than passivity, marks the agricultural labourers' attitude. Whenver I ask members of the present generation about changes in living standards, many of them answered that their parents found it easier to earn a livelihood in the old days, while at the same time they are certain that their own children will have a better life. This favourable view of the past *and* future combined with a gloomy view of the present seems to me to demonstrate the overriding spirit of impatience and rebelliousness among the landless today. They are only asking for that emancipation from exploitation and oppression which the government has long since promised them on paper. Yet their complaints go unheard and unregistered. The landowners control the landless with intimidation and, when this fails, with outright terrorisation. Those who, with the courage born of despair, take to overt action, have to pay a heavy price for their audacity and are ultimately liquidated if they remain adamant. The state that takes no action when agricultural labourers are murdered, has lost the right to proclaim itself protector of the largest working class in India.

## Notes

[The research, carried out between October 1984 and February 1985, was sponsored by the Indo-Dutch Programme on Alternatives in Development. Enid Perlin took care of the English translation. I gratefully acknowledge the support received from the Director and staff of the Centre for Social Studies, Surat. The paper, a first outcome of my recent stay there, is dedicated to the memory of I P Desai who urged me to write down my findings immediately on completion of my fieldwork.]

1 The only exception is a taluka in the east of the district—rather infertile, isolated and populated by tribals—where there are less than 10,000 agricultural labourers.

2 Breman (1985), Chapter II.

3 For these cane cutters' life and work, see Breman (1978-79).

4 Some political turmoil arose around the publication of a shortened Gujarati translation of my study on harvest workers recruited by the co-operative sugar factories in South Gujarat. The Rural Labour Commissioner was asked to make investigations and to produce recommendations which would improve work conditions in accordance with existing labour legislation.

5 I have in mind the agitation in rural areas led by Sharad Joshi. The movement which he started has become increasingly popular also in South Gujarat.

6 Breman (1974).

## Ashok Leyland

ASHOK LEYLAND has plans for product improvement and diversification which aims at consolidating existing markets and penetrating new ones with superior product attributes, traditional high product quality and application-oriented design. These, according to the Chairman Mantosh Sondhi, should considerably strengthen the company's market position. The company has already a good product strength in the two areas where the government has recently announced concessions in excise duty—vehicles with three axles and those with turbocharged engines. The company, in fact, is the only one in India manufacturing multi-axle vehicles. Apart from consolidating the product strengths and market standing in the traditional truck and bus markets, plans are afoot to realise new applications. The company's expansion programe to achieve a capacity of 40,000 vehicles by 1987 had to be considerably slowed down in the face of depressed market conditions. This has provided the company an opportunity to reappraise the long-term technological and product options. The management considers that the core of future product development and diversification must pertain to development of modern, fuel-efficient, weight effective and reliable engines which can meet the technological requirements of the 90s. The engine range would pave the way for the introduction of a diversified and technologically up to date product range. The company has entered into a technical collaboration agreement with Hino Motors, Japan, for manufacture in India of its 'W' series of engines. With a power band extending from 70 to 175 HP, these engines would be an invaluable asset in future product diversification. The company is seeking government approval of this agreement. The company will, in due course, firm up investment plans for this project. Sondhi feels that it is of considerable strategic significance that finalisation of this crucial collaboration should coincide with the reactivation of the company's expansion programme.

# Foreign Technology in the Four Modernisations of China

**K K Subrahmanian**

*China has introduced a number of economic reforms during its current phase of developing commodity production and exchange and the opening of the economy to the outside world. The approach has been towards establishing correct relations and modernising industry, agriculture, defence and science and technology. This new development strategy has opened up avenues for the inflow of foreign capital and foreign technology into socialist China from capitalist countries.*

*This paper makes an attempt to capture the increasing size of foreign investment and technology and to reflect upon its compatibility with the avowed objective of self-reliance in technology policy.*

THE economic historiography of New China is marked by different developmental phases. Ma Hong[1] has identified four broad phases, *viz*, (1) socialist transformation until 1956, (2) socialist construction between 1956-66, (3) cultural revolution between 1966-76, and (4) socialist modernisation thereafter. It has also been argued that "left errors" of extreme egalitarianism within, and closed-door approach to the outside world during the periods of the Great Leap Forward and the Cultural Revolution led to imbalances between the relations of production and the development of forces of production. Consequently, technological backwardness and low productivity were the characteristic features of those periods. Also there was no improvement in the material living conditions of the people.

A number of economic reforms have been introduced during the current phase towards developing commodity production and exchange and opening the economy to the outside world, based on the integration of the law of value and the role of the market with socialist planning. The approach has been towards establishing "correct relations" and modernising industry, agriculture, defence and science and technology. The new development strategy, with a thrust on what is called "Four Modernisations", has opened up avenues for the inflow of foreign capital and foreign technology into socialist China from capitalist countries. This paper makes an attempt to capture the increasing size of foreign investment and technology in the Four Modernisations and to reflect upon its compatibility with the avowed objective of self-reliance in technology policy.

## OPEN-DOOR POLICY

Needless to say, the "closed-door policy" followed during the earlier periods has been discarded in favour of "an open-door policy" for importing modern technology and expanding economic and technological exchanges with the capitalist countries. The change in the policy is absolved by taking a leaf out of the "Three Foundations" of Mao's Thoughts and citing Mao's often stated argument, "Chinese modernisation cannot take place in isolation from external technological development".[2] Whatever be the rationale for the policy change, the Four Modernisations favoured inflow of foreign capital and foreign technology on an unprecedented scale within the multi-layer structure of technology policy.

With the adoption of the open-door policy a trend was set for increasing import of foreign technology since the late 1970s, as reflected in the data on foreign investment approvals[3] (see Table 1).

At first, the indiscriminate imports began to tell upon budgetary and trade deficits and also upon the limit of indigenous capacity to assimilate foreign technology. A readjustment was soon introduced to correct the imbalance by emphasising expansion and renovation of existing plants in preference to setting-up of new plants, import of key technology instead of turn-key contracts for complete plants, and integration of imports with exports. Foreign business however, misread the readjustment as a retreat from the open-door policy and so the inflow of foreign investment declined in pace. The government hastened to initiate a number of legislative measures, strengthen the organisational set-up, and extend tax-concessions and other incentives to foreign business. Foreign investment picked up momentum again. Today, China is witnessing a wave of economic legislations and is providing liberal and preferential treatment (with regard to taxes, prices, domestic sales, wages, credit, etc) to improve upon the climate for attracting foreign investment and technology-transfer.

## INCENTIVES FOR 'FOREIGN INVESTMENT'

The legislative measures introduced so far are a long list of more than 40 laws and decrees,[4] such as, Law on Chinese-Foreign Joint-Ventures, Income Tax Law concerning Joint-Ventures, and the Foreign Enterprise Tax Law. In more recent years, the government has enacted the Patent and Trade Mark Law and has taken the decision to join the Paris Convention of Industrial Property and the Madrid Agreement on International Registration of Trade Marks. Attempts are on for the codification and publication of commercial laws and practices concerning foreign investment, technology-import and trade. Along with the legislative measures, efforts have also been made to simplify administrative procedures and to decentralise administrative powers by granting autonomy to the Governments of provinces and city municipalities in matters related to external economic transactions.[5]

The illustrative listing of incentives made in Table 2 underscores the flexible policy framework and liberal incentives being provided to attract foreign investment and to induce transfer of technology. China is now overtly seeking collaboration and expanding external economic rela-

TABLE 1: FOREIGN INVESTMENT APPROVALS IN CHINA

| Year | No of Equity Joint-Ventures | Per Cent | Value of Foreign Investors Share (US $ 10,000) | Per Cent |
|---|---|---|---|---|
| 1979 | 10 | 5.3 | 1437 | 4.4 |
| 1980 | 24 | 12.6 | 7629 | 23.1 |

tions with developed market-economy countries with a view to get access to foreign technology for carrying out the programme of "Four Modernisations".

### TECHNOLOGY-TRANSFER MECHANISM

Foreign firms can now operate through diverse forms and modalities in China. These include technology-contracts, processing/assembly of imported materials and compensation trade, co-operative production, equity joint-ventures, and wholly-owned independent foreign enterprises. The most preferred mechanism for technology transfer has been compensation trade and co-operative production (see Table 3). In these arrangements the Chinese partner provides land, buildings, materials (in the case of compensation trade only) and labour whereas the foreign collaborator provides machinery and technology, which become Chinese property eventually. The end-product (output) is bought back by the foreign collaborators until the original capital outlay is amortised. The major gain for China is the access to proven assembly/processing technology, though the arrangement also ensures access to foreign exchange resources for buying up machinery. This form of foreign operation, however, opens up a large scope for multinational corporations to indulge in "transfer pricing" and other restrictive practices with the result that the net gain to the Chinese economy is unlikely to be large.

Another important mechanism for technology-transfer has been the Chinese-foreign equity joint-ventures. The policy approach of the government towards foreign ownership and control in equity joint-ventures has been very flexible. China is not only charitable to foreign equity investment but even insists on a foreign share of not less than 25 per cent of the registered capital in any equity joint-venture, irrespective of the nature of technology. Investment can be made in cash, in kind, or in industrial property rights. Foreign majority ownership is sought in substantial numbers. Foreign-controlled investment is typical in light-industry products (see Table 4). Even when the majority ownership lies with the Chinese, there is sometimes a practice of making foreign partners' representative as the Managing Director or the Chairman or these posts are alternatively manned by foreign and Chinese nationals.

TABLE 2: INCENTIVES FOR FOREIGN INVESTMENT IN CHINA: AN ILLUSTRATIVE PICTURE

| Tax Conessions | Tariff Concessions | Other Incentives |
|---|---|---|
| Total income-tax exemption from first profit-making year and 50 per cent in 2nd and 3rd years | Reduction/exemption from customs duty and integrated commercial and industrial tax | Exemption from land charges from one to five years |
| Additional 15-30 per cent tax reduction for low-profit operation | 80-90 per cent tax reduction in respect of raw materials, etc, required for export production | Freedom to recruit staff and workers from open market |
| Additional tax reduction of 15-30 per cent in economically backward areas for 10 years | | |
| Carry forward losses for 5 years | | |
| 40 per cent refund of taxes on reinvested profits | | |

*Source:* Based on 'Comparative Investment Incentives', *China Economy and Trade*, July 31, 1983, pp 3-4.

TABLE 3: FORMS OF FOREIGN INVESTMENT IN CHINA: END 1983

| Forms/Mechanism | No of Units | Per Cent | Amount of Foreign Investment (US$ million) | Per Cent |
|---|---|---|---|---|
| Chinese-foreign co-operative oil exploration projects | 31 | 1.2 | 242 | 23.7 |
| Chinese-foreign co-operative production enterprises | 1129 | 45.7 | 323 | 31.6 |
| Compensation trade/processing and assembly of imported materials and components | 1067 | 43.2 | 86 | 8.4 |
| Chinese-foreign equity joint-venture | 190 | 7.7 | 329 | 32.2 |
| Wholly-owned foreign enterprises (independent ventures) | 53 | 2.2 | 42 | 4.1 |
| Total | 2470 | 100.0 | 1022 | 100.0 |

*Source:* As in Table 1.

On the whole, there is an apparent preference for foreign investment as a mechanism for acquiring technology from developed market economy countries. The observed preference may not be dictated by foreign exchange constraints as is generally the case with the other developing countries seeking foreign capital. For, China has a fairly comfortable foreign exchange position.[6] The logic of the policy-preference for foreign investment as a mechanism for import of technology is beyond easy comprehension.

### FIELDS OF FOREIGN INVESTMENT

As for fields of operation the Chinese policy in principle limits foreign investment and technology-import to preferred areas, where national efforts are inadequately developed. In practice, however, a significant proportion of joint-ventures is approved (or is being contemplated) in light industries and consumer goods (see Table 4). The logic of developing consumer goods may be in conformity with marco-economic reforms, which lay emphasis on consumption rather than capital accumulation. However, indiscriminate import of foreign capital and technology in areas where technology is less sophisticated and where indigenous sources can provide viable alternatives, may not be in conformity with a technology policy with self-reliance as its cardinal point.

It is also significant to note that a large proportion of foreign investment in China has been in the Special Economic Zones (Table 5). Very recently 14 coastal cities and the Hainan Islands were opened for foreign investment, with tax concessions and other incentives as in the Special Economic Zones. These Zones provide attractive terms and comprehensive scope for flexible foreign operations. To illustrate, foreign investment in the Zones are approved, and in fact, encouraged in agriculture and allied activities. A part of the production in the Zone is allowed (in prior approved cases) to be sold in China's domestic market. In some sense, therefore, the Special Economic Zones in China are different from the generally known Export Processing Zones in other developing countries.

### SOURCE OF FOREIGN INVESTMENT

Source-wise, the origin of technology-transfer is more evenly spread than foreign investment. Needless to say, collaboration with the USSR and East European countries has been at a low key during the current phase of development. Also much of the foreign-capital inflow into China is not from the major developed market-economy countries, Hong Kong (probably overseas Chinese) appeared to be the single biggest source of origin of the foreign capital inflow into China (see Table 6). The response of multinational corporations to the liberalisation in the Chinese policy-frame has been rather slow; a relatively cautious "step-up" approach is being adopted by Western business in making long-term commitment in a socialist system. Cultural differences, compounded by the long time taken in reaching a negotiated settlement of contract with Chinese partners, are other plausible explanations.[7]

TABLE 4: INDUSTRY-WISE DISTRIBUTION OF FOREIGN INVESTMENT PROPOSALS IN 1982

| Industry | No of Projects | Total Investment (US $ 10,000) | Value of Foreign Investment (US $ 10,000) | Share of Foreign Investment in Total Projects Total (Per Cent) | No of Projects with Foreign Majority Equity | Col 6 as Per Cent of Col 2 |

### SIZE OF FOREIGN TECHNOLOGY IN CHINA: AN OVERVIEW

Indeed, it is difficult to measure the overall impact of foreign technology in any country merely on the basis of the number of foreign-technology contract approvals or on the value of foreign investment. Apart from the overall size, pattern and general practices, an account of the detailed technology-contents and of operation in individual cases would be needed to delineate the impact. Nevertheless, macro-statistics do sketch out the contours of the problem. Viewed from such a limited angle, the available statistics clearly show China's rapidly raising economic transactions with the developed market economy countries during the current phase of development. Between 1979-1983 around 190 equity joint-ventures have been established and more than 1000 contractual projects under co-operative production (involving over US $ 3 billion of foreign capital) have been in operation. During the same period more than 350 contracts for technology-import (with an investment of US $ 1.8 billion) were reportedly approved by the government. China's foreign trade has grown from US $ 35.5 billion in 1978 to $ 86 billion in 1983. Its share in world export has increased from 0.75 per cent in 1978 to 1.25 per cent in 1983. Evidently, China has been looking increasingly to developed market economy countries for acquiring advanced technology, modern management practices, and investment funds for carrying out its Four Modernisations programme. Does the increasing reliance on foreign technology for Four Modernisations imply a drift away from "self-reliance" as the cardinal point in technology strategy? It will be of academic interest to reflect upon this question.

### SELF-RELIANCE OBJECTIVE IN TECHNOLOGY POLICY

The Chinese word for self-reliance is *ziligengshen*, which literally means "standing on one's own to change to a new life". The concept, which originated from Mao's operational strategy during the revolution, became the cardinal point in the development strategy in the 50s. In connotation self-reliance integrates Mao's nationalism with Lenin's theory of imperialism. In actual policy terms, however, self-reliance has never meant self-imposed autarky in China. At the same time, as an integral part of a multi-layer technology strategy, which gives priority to the use of domestic resources, self-reliance precludes massive foreign investment and unqualified import and assimilation of foreign technological inputs in socialist modernisation. Logically, the increasing recourse to foreign technology under the open-door policy, to meet the needs of Four Modernisations, needs to be evaluated in the above historic framework.

Several arguments can be advanced in defence of the open-door policy. There is no magic figure beyond which foreign capital and technology can be said to release dependence-consequences. Foreign aid and foreign investment constitute a very small proportion of the total investment in China. Foreign trade also accounts for a small share of the national income. With socialist (public) ownership of the means of production the present leadership can also claim to have the ability to avoid the dangers of technological dependence. After all, China did import a large quantum of technological inputs from the Soviet Union and East European countries during its earlier phases of development.

TABLE 6: ORIGIN OF FOREIGN INVESTMENT AND TECHNOLOGY CONTRACTS APPROVED IN 1983

| Country of Origin | Value of Foreign Investment Share (US $ 10,000) | Per Cent | No of Technology Contracts | Per Cent |
|---|---|---|---|---|
| US | 3671 | 19.5 | 46 | 21.7 |
| UK | 3602 | 19.1 | 18 | 8.5 |
| West Germany | — | — | 43 | 20.3 |

TABLE 7: SOME CHARACTERISTICS OF TECHNOLOGY-IMPORT IN CAPITAL GOODS SECTOR IN CHINA

| | Total Sample | Wholly Domestic Firms | Domestic Firms with Foreign Collaboration |
|---|---|---|---|
| No of firms | 19 | 11 | 8 |
| Percentage value of equipment less than 5 years old | 14.7 | 15.6 | 14.3 |
| Output per worker in 1980 (thousand US $) | 4.4 | 3.9 | 4.6 |
| Export as percentage of sales (in 1980) | 2.9 | 6.3 | 1.8 |
| Average no of new products added in 3 years | 9.3 | 10.7 | 5.6 |
| Technical elements in licensing agreements (as per cent of total) | | | |
| a) Basic design | | | 84 |
| b) Detailed design | | | 97 |
| c) Assistance in manufacturing | | | 100 |
| d) Training | | | 100 |
| Age of design (per cent total) | | | |
| a) Upto 5 year old | | | 16 |
| b) 6-9 year old | | | 81 |
| c) More than 9 year old | | | 3 |

*Source:* Adapted from Tables 7, 8 and 10 from UNCTAD, "Technology Issues in the Capital Goods Sector, the Experience of the PRC", United Nations, 1984, UNCTAD/TT/57.

All these are valid arguments. Yet, the qualitative dimension of external transactions cannot be lost sight of. Foreign aid from the Soviet Union in the earlier phases came without any strings. Yet, the Russian withdrawal adversely affected the pace of economic development and exposed the economy to serious stresses and strains. On the other hand, when the country was consequently forced to follow a more self-reliant technology policy, it could strengthen its indigenous technological base and raise productive capacity. The remarkable achievement made by China in steel production and similar capital construction projects illustrate the dynamic strengthening of domestic technological capability nurtured under self-reliance. Modernisation does not *ipso facto* imply indiscriminate import of foreign technology.

Indeed, economic and technological exchanges between China and other countries are carried out at the formal policy level on the principle of equality and mutual benefit. Zhou Enlai's four points (*viz*, "First use, second criticise, third improve and fourth make it our own") require a process of selective importation, local adaptation and improvement of technology whereby it becomes Chinese technology and strengthens the domestic technology-base. Without a detailed analysis of the micro-behaviour it is difficult to say whether or not these principles are in fact being practised by enterprises in a political environment that overtly welcomes foreign investment and technology.

## SOME UNDESIRABLE FEATURES

There are very few studies (available in the Engligh language) which have examined in detail the working of foreign collaborations and joint-ventures in China. A recent study prepared by a Chinese scholar on technological issues in the Chinese capital goods sector *inter alia* underlines certain undesirable features of technology-import in general and joint-ventures in particular. The sample survey carried out for the study revealed the following: (1) technology import through contractual arranagement has been on the increase, (2) the secrecy clause in the contract meant multiplicity of contracts for the same technology leading to "excess" import of technology, (3) technology contracts encompassed mainly detailed designs and assistance in manufacturing and training but very few cases included basic-design transfer, and (4) technology transferred in most cases was not the most modern. The survey further revealed that wholly domestic enterprises and those with foreign collaboration did not suggest any significant differences in the type of technology used (as reflected in the age of machinery and equipment) and in relation to productivity. On the other hand, contribution of enterprises with foreign collaboration to exports and in the addition of new products was found relatively low as compared to wholly domestic enterprises. A summary view of these characteristics (reproduced in Table 7) raises doubts on the effectiveness of Chinese technology policy in making the best use of imported technology and in warding off the consequences of technological dependence.

The impression the author carried from a recent visit to some joint-ventures in China also did not suggest that the foreign-controlled firms made any serious attempt towards unpackaging, adaptation, assimilation and upgradation of imported technology. On the other hand, some wholly domestic firms, which modernised their plants and production processes by piece-meal and outright purchase of key technology—embodying designs, machinery and control equipment, were found successful not only in raising productivity and surplus generation but also in duplicating and improving upon imported technology through local R and D efforts. Such 'successful' cases were not found limited to basic industries (steel) Chinese firms engaged in the production of some consumer goods (e g, watches, motorcycles, etc) were also found to be innovative. The capability demonstrated by the wholly Chinese owned enterprises for modernisation without establishing a "dependence" relationship with multinational corporations was remarkable in many cases. It was not that the Chinese enterprises were innovators matching the American or Japanese firms. After all, the process of industrial innovation as it occurs in a socialist economy should not be judged (or "reformed") in terms of the known dynamics of a capitalist economy. Against such an impressionist background the scant attention in the current "open-door policy" towards foreign ownership control, which could dampen domestic initiatives for indigenous innovation, looked beyond easy comprehension. All facets considered, one could sense a "drift" in the connotation of self-reliance as the cardinal point in Chinese technology policy during the current phase of developement.

## CONCLUSION

In conclusion, China's commitment to fast modernisation and rapid export expansion matching that of industrialised capitalist countries has meant a liberal policy approach to foreign technology. The patterns and modalities of foreign investment and technology-transfer under the "open-door" policy however leave behind some intriguing questions. For instance, will not the Special Economic Zones as a modality for foreign investment and technology-transfer turn China into a "raw material base", "repair and assembly workshop", and "investment centre" for foreign firms and multinational corporations? Will not foreign businesses stand to profit from cheap Chinese labour and raw materials more than what the Chinese stand to gain in terms of the acquisition of 'modern' technology? Will not the casual policy approach to foreign ownership control lead to a situation (at least temporarily) of exploitation by multinational corporations and foreign-capitalists? Will not the open-door policy towards foreign capital and technology inhibit indigenous initiative for technological advance?

Clearly, there are no easy answers. China like any other developing country with a weak technological profile is in a policy dilemma. A closed-door policy implemented in a dogmatic style slackens the pace of modernisation and stalls the development of the forces of production. An up-turn towards an open-door policy, on the other hand, has the potential danger of stifling indigenous learning and of pushing the domestic economy towards technological dependence. Contradictions do arise between technological self-reliance and indiscriminate import of foreign technology. To what extent unity among these opposites can be brought about will *inter alia* depend upon the strength of autonomous forces for adaptation and innovation. It follows that effective regulation for selective import of foreign technology within the framework of "self-reliance" still remains the viable policy-option for developing countries including, China.

## Notes

1 Ma Hong, "New Strategy for Chinese Economy", World Press, Beijing, 1983, pp 12-19.

2 However, it is ignored that Mao had also qualified his support to the idea of learning from the strong points of all nations by saying that 'we must firmly reject and criticise all the decadent bourgeois system, ideology and ways of life of foriegn countries" (see, 'On the Ten Major Relations' in "Selected Works", Vol V, Foreign Language Press, Beijing, 1977).

3 This is also reflected in the trend of machinery import, which as a proportion of the total import bill rose from 15.2 per cent in 1977 to 17 per cent in 1978 and further to 26 per cent in 1979. During the period, large scale turn-key contracts (e g Baoshan Steel Complex and Nanjing Petrochemicals) were signed with 'foreign firms'. In 1978 alone contracts worth US $ 6,400 million were signed with foreign firms.

4 For a detailed listing, see "China's Foreign Economic Legilsation", Foreign Language Press, Beijing, 1984.

5 To illustrate, the organisational back-up such as the Foreign Investment Control Commission, China International Trust and Investment Corporation, Industrial Product Corporation of Ministries, etc, have been added. Provincial governments have been delegated power to directly negotiate with foreign firms and approve cases upto a value of 30 million yuan.

6 Chinese foreign exchange reserves reached the figure of US $ 11.3 billion by 1983 and gold reserves are worth US $ 3.4 billion.

7 For a detailed discussion on the negotiation bottlenecks in China, see A E I Rae, 'Talking Business in China', *China Quarterly*, No 90, June 1982.

---

## Volatile Exchange Rates

EXCHANGE rates of heavily traded currencies continued to display marked volatility against the US dollar in April, although changes over the course of the month were small compared with the sharp monthly movements in February and March. Most currencies eased slightly against the dollar during April; the exceptions were the Swiss franc, which was unchanged, and the pound sterling and Canadian dollar, which both firmed slightly. The dollar strengthened in April by 0.45 per cent in effective terms (based on calculations of the IMF's multilateral exchange rate model) and was essentially unchanged from March against the SDR. In the 12 months through April 1985, the dollar was the only major currency to strengthen in effective terms.

# Change is permanent

**Change is the essence of growth, an edict of management.**

**And, in today's world, the choice before an organisation is not between 'change' and 'no change', but between managing the change and being managed by events.**

**Change, when consciously imposed from within, opens up new opportunities, new avenues of growth. Paradoxically, the process of change is, and has to be, permanent.**

**This is the philosophy behind the changing role of MMTC — from a mere canalising agency to an international trading house.**

Change, to MMTC, has meant putting its expertise in bulk buying and selling to larger purposes of national growth

Like opening up global markets for India's small scale entrepreneurs. Adopting new strategies like Third country trading, Three-way trade, Joint ventures both in India and abroad, Equity participation abroad in sources of raw materials as well as in basic inputs.

Entering the arena of non-canalised items — ranging from importing PVC resins and mercury to exporting diamonds and graphite electrodes.

Improving customer service by decentralising operations, streamlining the distribution system and setting up Customer Service cells.

Reorienting the organisation to meet new challenges — through long-range planning, computerisation, systems reappraisal and organisation restructuring.

And this change already reflects in MMTC's performance. Non-canalised exports registered a fourfold increase in the first half of 1984-85, while the year's turnover is poised for a threefold rise. A record quantity of fertilisers was imported, at the right time, resulting in an all-time high foodgrain production and substantial savings in foreign exchange. Long-term contracts worth millions of dollars have been concluded for iron ore exports. For the first time, a counter-trade deal has been finalised with Zimbabwe for importing Asbestos against the export of engineering goods — an important step towards diversification and growth.

All this has led to increased employment opportunities which now exceed half a million and generated a new industrial and economic prosperity.

Yes, change is permanent. A philosophy chiselled in the minds of everyone at MMTC, the cornerstone of its success.

# Troubled North-East

THE recent clashes on the Assam-Nagaland boundary between the armed police forces of the two states in which officially nearly fifty policemen as well as a dozen or so civilians are known to have died brings to the fore once again perhaps the most bitter of the many boundary disputes in the region. Barring Manipur and Tripura which were independent kingdoms, all the remaining units of the region were once part of a greater Assam whose geographical boundary extended far beyond its cultural frontiers, which properly speaking have always historically been the Brahmaputra valley and some outlying areas to the west, mainly modern Cooch Behar and adjoining areas.

The annexation of Assam in 1826 was followed by the usual British policy of forward consolidation of the borders. In that process, the Naga-inhabited areas broadly corresponding to the western parts of present Nagaland were annexed, after overcoming considerable resistance put up by the Nagas, and a 'Naga Hills District was constituted in 1866. The boundaries of that district, as any maps of the area in British accounts of the annexation of its eastern frontiers will testify to, extended well beyond the present borders of Nagaland and included areas of present-day Nowgong, Jorhat and Karbi Anglong districts of Assam.

However, in the next half a century or so of administrative and political consolidation as well as commercial exploitation of the area, substantial areas of the original Naga Hills District were 'denotified' and included in the Brahmaputra valley districts. The reasons were both administrative and political. The British entrepreneurs in the tea industry had to be granted vast tracts of land under the most generous system of land tenure; and the new railway lines that were soon to be laid to transport the tea had to be secured from Naga depredations.

Leaving aside the historical claims that Nagaland makes of the 'traditiona boundary' dating back to the days of Ahom kings of medieval Assam, Nagaland appears to have a case even if one were to take into consideration more modern times; and the denotification of these areas which as recently as a century ago were officially included in the Naga Hills District, along with the declaration o vast areas on the border as 'reserve forests' (where Assam has either been unable or unwilling to prevent encroachments of various kinds on its side, including, as people on the Assam side themselves acknowledge, of many 'foreign nationals' have always rankled with the Nagaland authorities. These long-nursed grievances have occasionally broken out in clashes, the most serious of them being those in 1972 (when, as now, the police of the two states fought pitched battles), 1979 and now in 1985.

These clashes have also exposed some of the cherished myths about the bourgeois state in general and the north-east in particular. First and foremost is the myth of that variety of national unity as is propounded by the ruling party. Both the states in the dispute are headed by Congress(I) chief ministers, as indeed are al other states and Union territories of the region except Tripura. And yet, barring Tripura, Assam has border problems with every other state and Union territory of the region. Indeed, the meeting of the Congress(I) Co-ordinating Committee of which the Assam chief minister is the chairman, held in Guwahati in the wake of the clashes, could do little but reiterate pietitudes and the briefings, if they can be called that, were apparently done by the participating chief ministers separately Further discussions in Delhi in the presence of the Union Home Minister have made little headway. The Nagaland chief minister has gone back and informed his state assembly that Assam is entirely to blame for the clashes. Hiteswar Saikia who in his turn has summoned a special session of the Assam assembly next month (July 12) may be expected to return the compliment.

It is true that going by the example of other inter-state disputes in the country (the unending bickering over the Maharashtra-Karnataka border or the prolonged disputes over waters of various rivers involving virtually all the states of the Union one sees the same pattern where all the parties to the dispute belong to the same political party. However, it would be taking the easy way out to attribute these inter-state conflicts only to the machinations of the ruling party. In the dispute over the Nagaland-Assam boundary, for instance, organisations which are apparently opposed to the Centre as well as the state governments appear to have been as belligerent and rigid as the state governments themselves. The All Assam Students Union, for instance, which refuses to 'recognise' the Hiteswar Saikia ministry, has blamed it for 'inept handling' of the issue but has not questioned in any manner the state government's version of the boundary dispute. An organisation like the Naga Students Federation which claims to be 'radical' and considers itself to be part of the struggle for achieving 'sovereignty and independence' for Nagaland has backed to the hilt the Congress(I) chief minister of Nagaland on the boundary dispute.

In other words, these border problems which are for the most part inherited from history and imperialist intervention have, instead of being resolved following the achievement of national independence, become more intractable. Further, the mere creation of a 'state', however unnatural its boundaries might be, has meant the intensification of regional and even 'national' loyalties. A positive intervention from the left through democratic struggles could have set matters right or at least helped in the easing of tensions; but the path of Indian politics has been such that mass movements in these times have almost as a rule been led by reactionary and demagogic sections of the bourgeoisie who have, often in league with and with intellectual and material assitance from imperialist agencies, shown great skills in appropriating the genuine grievances of the masses to serve and consolidate their own positions.

## *Congress(I)*

### Homecomers' Dilemma

THE Congress(S) President Sharad Pawar has, not for the first time, 'categorically' ruled out the possibility of his party joining the Congress(I) and, more to the point, of himself deserting the Progressive Democratic Front in Maharashtra and joining the ruling party. The camp of the Congress(S) that is scheduled to meet later this month in Nagpur will only be discussing the 'present political situation' and should not be seen as a platform for self-liquidation.

However, the Congress(S) President cannot complain if there is some lingering sceptism about the viability, or even the continued existence, of the Congress(S) as a separate political party. Even as Sharad Pawar was making these brave noises, the Tripura unit of his party had merged unconditionally with the Congress(I). Further, the drama that is currently on in West Bengal over former chief minister Siddhartha Sankar Ray's step-by-step entry into the ruling party is bound to have its impact on others knocking on the doors of the ruling party. It is remarkable that Siddhartha Sankar Ray has been able to involve himself, clearly against the desire of most of the local leaders of the party who for the present appear to have yielded to the behests of the Centre, in the campaign for the municipal elections in Calcutta on behalf of the Congress(I) though only months ago he had been held responsible for ruining the party candidate's chances in election for the Darjeeling Lok Sabha seat. An even more remarkable achievement has been that his impending entry into the ruling party has brought about unprecedented unity in the ruling party in West Bengal on the question of not allowing him entry. But whatever be the impact of the Ray factor on Congress(I) politics in West Bengal, it is clear that his entry into the Congress(I) is bound to affect all those 'Congress-minded persons', among whom Siddhartha Sankar Ray has modestly counted himself as just one, who too have been waiting in the wings. Surely not even Sharad Pawar will deny that many of his partymen are moved by similar public spiritedness.

It is difficult to fault the plans of the homecomers or to sympathise with their dilemma when the bitter awakening ensues. They have to calculate and time their moves to a nicety, especially in view of the uncertain state of the crisis in the ruling party. For, the break-up of the monstrous Congress(I) parliamentary party—which, despite the anti-defection law and its seeming impregnability, appears unavoidable—offers many more opportunities for those confident of gaining entry than to those who are already within. Extreme aggravation of the numerous crises in the states or an unexpected vacuum in leadership is bound to provide opportunities which can be better exploited by 'Congress-minded men' untainted by the crises that have been created by (and consumed) those already in power and office.

That the ruling party itself welcomes these elements, there can be little doubt. The overtures made at the time of the celebration of the centenary of the Congress, for all the clumsiness and lack of grace, did indicate some anxieties on the part of the leadership to secure the return of some of these 'Congress-minded men' presently outside the fold—at least to ensure that they will in their respective states curb the ambitions of the bosses who seem to be making a return in the states. The developments in Maharashtra are especially relevant and in the context of the state's politics, it can be argued that Rajiv Gandhi needs Sharad Pawar much more than the other way round at present.

## *Politics*

### Mileposts to Disintegration

WHILE Rajiv Gandhi was inaugurating the dazzling Bharat *mela* in the Paris garden to allow the Frenchmen a glimpse into the unity in the midst of diversity that is supposed to be India, India, however, took upon herself, as if perversely, the task of demonstrating to the wide world the reverse side of the medal, that is, hostilities lurking within the Indian unity. Not only did the continuing sectarian brutalities as in Ahmedabad (Gujarat), Hoshiarpur (Punjab), and Tripura assume even grosser forms, a brand new battle front was opened during this time on the Assam-Nagaland border. The exchange of fire between the armed policemen of the two states, in which rocket launchers and mortars were reported to have been used, continued for days together. Scores of lives were lost, with many more reportedly missing, hundreds of homes in the border village of Merapani were burnt down and thousands of villagers fled for their lives. The Assam chief minister was reported as having said that it was "as if a war had broken out between the two states". He does not seem to be far wrong as the cessation of hostilities was achieved only after talks between the chief ministers of the two states had been held on the neutral ground of Imphal, the capital of the neighbouring state of Manipur, through the good offices of General Krishna Rao, governor of Nagaland, Manipur and Tripura. The two chief ministers jointly recommended the induction of 'neutral' central para-military forces for 'peace-keeping' purposes. Even as the ceasefire was coming into effect, about 150 more houses were reported to have been set ablaze.

While the Congress(I) government has rushed through Parliament draconic laws to crush terrorism and quash threats to the unity and integrity of the country, it failed not only to *prevent* the mini-war between the two states ruled directly by it, but even to bring a quick disengagement once it had started, though a Union minister present in Assam during the armed clash tried her hand at peace-making.

It is rather ironic that Rajiv Gandhi was holding detailed discussions with the Egyptian and Algerian statesmen about the ways and means of ending the Gulf war when this small war was raging in his own backyard.

Implied loss of diplomatic face apart, Punjab, Gujarat, Tripura and Assam-Nagaland—all these are successive mileposts to an anarchic disintegration of the country. The Congress(I) government, keen though it is to expand its repressive powers and instruments in the name of fighting the 'forces of disintegration', does not appear to be equally effective in strengthening the real unity of the diverse streams of the Indian people. The Congress(I) Union and state governments demonstrably failed to prevent a civil war between their own units. The Congress(I) is seen to go even further in fomenting similar crises under certain circumstances. The Bhindranwale episode which played no small part in raising the Khalistan frankenstein is well known. The latest events in Tripura—another sensitive area on the international frontier—are no less pertinent in this context.

Here the Union government's actions have been guided by the narrow party-political objective of discrediting the Left

Front government headed by Nripen Chakravarty. The Tripura government has consistently held that it is not necessary to deploy the army to deal with the tribal insurgency in the state; that in fact it may prove counterproductive to do so since operations by the army would further provoke and alienate the tribals. It is also true, of course, that the CPI(M) chief minister fears that once the state passes largely under army control, the likelihood of the Centre imposing President's rule would be strengthened. Nripen Chakravarty has been trying instead to deal with the situation by using the para-military forces while at the same time working for a political solution of the tribals' grievances. The Centre while it has been on the one hand pressing upon the state government the need to use the army to contain the insurgency, on the other hand it has been prevaricating over the state's request for two battalions of the BSF. It is difficult to see what conclusion can be drawn from the Centre's attitude other than that it wants to discredit the Left Front government on grounds of its failure to contain the tribal insurgency.

Given such motivations, dazzling, even if highly expensive, displays of India's art and culture in Paris and Washington may help Rajiv Gandhi momentarily to brighten his image at home and abroad; would they, however, make any real contribution to the exercise of strengthening the fabric of Indian polity or even his own administration in the long run?

## *Sri Lanka*

### Fragile Ceasefire

*M S S Pandian writes:*

THE June 18 ceasefire agreement between the Sri Lankan government and the Tamil militants is no doubt a great relief to the civilian population in the northern and eastern provinces of Sri Lanka. However, whether a solution will be hammered out during the period of ceasefire or whether the ceasefire itself will last for the proposed period of eighteen weeks is doubtful. Already there are sufficient signs indicating that the hopes raised by the ceasefire may turn out to be short-lived.

As of now, the Sri Lankan government has not proposed sufficient concrete steps towards resolving the Tamil question. The only suggestion that has been spelt out so far by the government is that greater autonomy will be given to the Tamils at the district councils level. But the Tamils are demanding more power at the provincial level and that too by treating both the northern and eastern provinces as one unit. The refusal of the All Party Conference convened by the government, to consider this demand of the Tamil United Liberation Front (TULF) led to breakdown of negotiations in the past. In fact, the National Security Minister Lalit Athulatmudali has reiterated that the northern and eastern provinces will not be treated as a single unit of administration. Hence, it is doubtful whether any meaningful negotiations can be resumed.

The statements made by Athulatmudali following the ceasefire also give rise to doubts about the real intentions of the Sri Lankan government. Describing the Tamil militants as "some foolish young men who had decided to take up arms", he stated that the Liberation Tigers of Tamil Eelam (LTTE), the largest of the Tamil militant groups, had agreed to the ceasefire because of the military setbacks suffered by it of late. This has been strongly contested by the LTTE. One does not know whether the uncalled-for remarks of the National Security Minister are an indication that the militants will not be granted political status by the government and ignored as partners in the proposed negotiations. The issue is complicated because the TULF is categorical that it will not participate in any negotiation unless the militants are also invited. Further, Athulatmudali has claimed that there are 35 militant groups operating in the island and if any group violates the ceasefire, the troops will take counteraction. But only five of the groups are party to the ceasefire agreement. Given the ability of the Sri Lankan army to brew trouble and blame the Tamils for it (as they did in Karaitivu in April 1985) one has to wait and watch if the ceasefire will last for the agreed period.

More importantly, the powerful Buddhist clergy in Sri Lanka is unlikely to cooperate in the search for a meaningful solution to the Tamil problem. It is demanding that in any negotiation on decentralisation of power, powers relating to land colonisation and education must rest with Colombo. In fact these two are the very issues which led to discontent among the Tamils. The Tamils feel that the present admission system at the level of higher education is loaded against them. Also, the efforts by the government to settle Sinhalese in Tamil-dominated areas have been violently resented by the Tamils. One may recall that in November 1984, the Tamil militants raided the Kent and Dollar farms, kiling a number of newly settled Sinhala ex-convicts. The opposition of the Buddhist clergy to any change in the educational and colonisation policy of the government may prove to be a major stumbling block in finding a solution.

One factor that may force the Sri Lankan government to meet some of the demands of the Tamils, at least temporarily, is the deplorable state of its economy at present. The defence budget in 1985 is estimated at SL Rs 5.6 billion or as much as over seven times the amount spent in 1977. This rocketting expenditure, used essentially to fund the escalating battle against the Tamil militants, is severely straining the govrnment's resources. Then again, the decline in the international tea price is already telling on Sri Lanka's foreign exchange inflow. The island's tourism industry, another important avenue of foreign exchange earning, has been severely crippled by the conflict. It is forecast that the current year's trade deficit will be twice last year's which itself was $ 65 million. Thus Sri Lanka needs increased aid from western donor countries. Unless convincing progress is made by the government in solving the island's internal strife, the donor countries seem unwilling to respond positively to its financial needs. It is worthwhile to note here that on June 19, i e, a day after the ceasefire was enforced, Sri Lanka asked the donour countries to step up foreign aid on the strength of the ceasefire agreement.

# Running Wild

THE stock markets in India are making history. Never before in living memory have they been known to have moved so fast in a bull or bear campaign. The rise in quite a large number of scrips in the 'specified' as well as 'other securities' list could well be described as spectacular and staggering. The current upswing started about the middle of November and by June 21, the *Financial Express* equity price index for Bombay had risen by 82 per cent and the all-India index by 75 per cent. This rise far exceeds the total rise recorded during the past four years—1981 low to 1984 high—the Bombay index having moved up by 64.7 per cent and the all-India index by 47.7 per cent.

The markets have come a long way since the middle of November but still they show no signs of weariness. Despite the phenomenal rise that has already taken place, the upward trend have got considerably accelerated over the past few weeks. Since the beginning of June alone, the Bombay index has gone up by 18.6 per cent (against 18.96 per cent in the whole of 1984) and the all-India index by 17 per cent.

There has thus been no let-up in the bullish fervour which has, in fact, acquired a new dimension with the bullish mania spreading to non-specified securities. Rigorous margins enforced by the stock exchange authorities at the instance of the Union Finance Ministry have failed to produce the desired impact of restraining speculative activity or checking the runaway boom in equity prices. Speculators have diverted their attention to 'other securities'. While the code of conduct prescribes that transactions in these shares are to be strictly on the basis of actual delivery, an overwhelmingly large proportion of the business is being currently transacted on a speculative basis. The stockbroking community has its own ingenious ways of recording transactions which, though speculative in nature, can pass as conforming to the rules of the game. One can scarcely find fault with the trading community when the government itself has permitted carry-forward facilities in respect of the 'specified' group of shares, reducing the official ban on forward trading to a complete farce.

The stock market's unbounded optimism reflects essentially its firm conviction about the dawn of a new era for the private sector. The policies initiated and implemented by the government headed by Rajiv Gandhi have infused a lot of confidence among the investing classes. Captains of industry are inclined to the view that the policies pursued by the government will lead to a substantial transformation of the country's economy. Rajiv Gandhi's recent foreign tour has raised high hopes about the massive inflow of foreign capital and technology in course of time which is expected to help accelerate the economic tempo.

New Delhi can have no sound reason for feeling unduly concerned over the runaway boom in equity prices. All it has to do is to abolish the capital gains tax which is coming in the way of financial institutions, as also other big investors, unloading their shareholdings in bigger volumes in the market. The proportion of institutional holdings has been increasing year after year. Despite the spectacular rise in equity prices which has lifted the prices of several shares far above their book value, institutions are reluctant to sell their holdings because of the incidence of capital gains tax. The sale of shares at the current high prices would not only strengthen the resources position of the financial institutions but also help broad-base shareholding which has much to commend it.

The unprecedented boom on the stock exchange has made a strong impact on the capital market. The new issues market has turned remarkably buoyant. Instances abound where new issues start commanding premiums immediately after their announcements and not unoften a fairly large volume of business is transacted unofficially before the shares are listed on the stock exchange. While investors have shown marked preference for new issues by the existing companies with a proven track record, issues even by new entrepreneurs have evoked fairly good response. With the shares of listed companies quoted substantially above their book value, let alone face value, it is quite natural that investors should respond to new issues by these companies in a big way when these are offered at par or at modest premium.

Most of the issues promoted by established companies of repute have evoked overwhelming response and all the issues are currently commanding fancy premiums. The recent issue of 34 lakh equity shares of Kinetic Honda Motors has set a new record, the issue to the Indian public having been oversubscribed by 150 times and that to non-resident Indian by over 50 times. The share of the face value of Rs 10 is unofficially commanding a premium of over Rs 100. The overwhelming response to new issues, especially of existing companies, is a measure of the volume of investible funds with the public as also of the prospect of making quick and sure money.

## *New Issues*

### Questionable Ways

THe success of issues (equity or debenture) by well-managed companies has never been in doubt even when the capital market was not in very good form. Considering the unprecedented boom the stock market and the capital market are currently enjoying, it is rather surprising that even highly reputed companies should deem it necessary to make exaggerated claims in their advertisement/publicity campaigns or resort to questionable methods in marketing their new issues. Two instances merit attention—the non-convertible issue by Reliance Textile Industries and the equity-linked debenture issue by 20th Century Leasing.

Reliance is offering 15 per cent Rights secured redeemable non-convertibe debentures of Rs 100 each at par aggregating Rs 100 crore. Under the present guidelines, the company can retain upto Rs 150 crore collected by way of subscriptions to the issue. Reliance has made corporate history in that no other company has achieved the kind of phenomenal growth it has. Currently, it ranks number three amongst all Indian companies in terms of sales turnover, capital employed and gross profit. No other company has rewarded its shareholders, deposit holders and debenture holders the way Reliance has done. The success of the proposed debenture issue is a foregone conclusion. Even so, the company has deemed it necessary to issue private placement application forms. This is understandable enough. The management has apparently no intention of going in for additional investment in debentures accruing by way of rights. Also, the public is being given the opportunity of joining the Reliance family by subscribing to debentures. But what is one to make of the circular issued by a stockbroker handling the private placement of the Reliance debentures which states "we shall pay you sub-brokerage at the rate of 1.5 per cent of the face value of debentures applied by you irrespective of allotment which means whether you get the allotment or not you are entitled for sub-brokerage. The sub-brokerage will be paid as soon as we receive the statement from the company." The circular further states that "an investor who is investing in debentures now is entitled for 15 per cent per annum, i e, 1.25 per cent interest per month and 1.5 per cent sub-brokerage. If refund is made within two months your return will be four per cent for two months investment and if you get allotment you will get some premium in the market." The company cannot be unaware of the kind of canvassing the brokers are doing to promote investment in its debentures. Should not a company of RTI's repute discourage such unethical practices? RTI debentures do not require any additional incentives.

Take again, the equity-linked debenture issue by 20th Century Leasing—simultaneous allotment of two equity shares of Rs 10 each at a premium of Rs eight for each debenture of Rs 100 carrying an interest of 13.5 per cent per annum. Managed by a team of well-qualified competent and dedicated professionals, the company has achieved highly impressive growth over the past three years— gross assets leased up from Rs 7.41 crore to Rs 21.45 crore, revenue up from Rs 1.63 crore to Rs 5.56 crore and gross profit up from Rs 1.16 crore to Rs 3.56 crore. The company enjoys unquestioned leadership in the leasing industry. With the company's share quoted at around Rs 68 ex-bonus (the only leasing company in India to make a two-for-five bonus issue after going public), there can be no question whatsoever about the rights-cum-public equity-linked bonus issue evoking excellent response. Why does a company of such high repute have to advertise that the proposed issue offers "infinite" return on the altogether specious plea that the holder of one debenture and two equity shares whould have recovered his full money (Rs 136) by the sale of two equity shares immediately after allotment, though he would still be getting a return on his debenture. The return without any "net investment"—the money originally invested has been fully recovered from the sale of two equity shares—has been termed as "infinite". This is a statistical absurdity. What has been termed as "infinite" by the company is very finite. The debentures are redeemable in five equal instalments after the expiry of the fifth year. The total money that will accrue to the investor who takes up one debenture and two equity shares under the stipulated option (sale of two shares on allotment) will be Rs 136 plus Rs 100 (being the value of the debenture) plus interest on this debenture which will be less and less as the debenture gets redeemed. It does little credit to a professionally managed company to promote concepts which cannot stand close scrutiny. That the company's equity-linked debenture issue is indeed very attractive will be readily conceded.

## *Steel*

### Unpretty Picture

EVEN the most optimistic official projections show that the domestic output of steel will continue to fall short of demand in the Seventh Plan and beyond. According to the annual report of the Ministry of Steel, Mines and Coal for 1984-85 the output of saleable steel in the country is expected to increase by 45 per cent from 9.19 million tonnes in 1984-85 to 13.02 million tonnes in 1989-90. This will fall short of the likely demand of 13.86 million tonnes in 1989-90 worked out by the Seventh Plan working group on the iron and steel industry.

What is worse, looking at the trend so far, even the projected output of 13.02 million tonnes may not materialise by 1989-90. The achievement of the targeted level of output would largely depend on the performance of the public sector steel plants under SAIL which account for 80 per cent of the output of steel by the integrated steel plants in the country. The production of steel by SAIL plants dropped from 5.65 million tonnes in 1981-82 to 4.77 million tonnes in 1983-84. It increased to 5.41 million tonnes in 1984-85, but still failed to catch up with the previous best level achieved in 1981-82.

The measures mentioned to achieve the target are expansion of the Bhilai and Bokaro steel plants to four million tonnes capacity each, setting up of the 3.25 million tonne capacity Visakhapatnam steel project, modernisation of the Durgapur and Rourkela plants and creation of captive power capacities at Bokaro, Durgapur, Rourkela and Bhilai. These schemes are not, however, backed up by adequate financial allocations to ensure their timely implementation. For instance, funds are yet to be provided for the modernisation programmes of the Rourkela and Durgapur plants. For the Visakhapatnam steel project, only a meagre sum of Rs 215 crore has been approved for the current year. At this rate, the project is not likely to be commissioned by the end of the Seventh Plan period. Bhilai steel's 3×60 MW captive power plant still continues to be at the planning stage only.

Recently, the government has decided to reduce the allocation for steel in the Seventh Plan to Rs 8,500 crore from the Rs 13,141 crore recommended by the working group on steel in view of the acute scarcity of resources. Within this revised overall outlay of Rs 8,500 crore, the plants under SAIL are expected to receive a share of about Rs 4,500 crore, if ther is no further cut in the allocation for the steel sector.

Even the immediate outlook is no better. With a pick up in the demand for steel, not matched by adequate increase in output, the demand-supply gap is expected to widen in the current fiscal year, necessitating huge imports. While the demand for steel had declined by nine per cent to 9.01 million tonnes in 1984-85, it is expected to spurt by 26 per cent to 11.35 million tonnes in 1985-86, according to official projections. Thus while the demand for steel is expected to increase by 2.34 million tonnes in 1985-86 over the previous year, domestic production is projected to rise by only 1.07 million tonnes to 10.26 million tonnes.

The pick up in the demand for steel is evident from the depleting stocks with the main producers (SAIL and TISCO). Stocks, including those of imported steel, declined to 6.41 lakh tonnes as on April 1 from 9.35 lakh tonnes a year ago. The stocks with the main producers had increased by 45.5 per cent to 16.65 lakh tonnes as on April 1, 1983 from the level of 11.77 lakh tonnes a year earlier.

Sometime back the Joint Plant Committee and SAIL had estimated that the country may have to import about 1.2 million tonnes of steel in 1985-86 at a cost of Rs 1,000 crore at current domestic prices. However, to avoid a situation of scarcity, the government has recently decided to import 1.7 million tonnes of steel during the current fiscal year. This decision was taken by an inter-ministerial committee which has been specially constituted to closely monitor and authorise steel imports. The foreign exchange outgo on steel import of 1.7 million tonnes is expected to be around Rs 1,400 crore.

Thus the situation is changing from one of glut two years ago to that of scarcity, notwithstanding the recent hikes in steel prices effected by the JPC. To improve supplies, there is an imperative need to create new capacities expeditiously apart from making optimum use of the existing capacities of SAIL plants. Though the overall capacity utilisation of SAIL plants improved to 76 per cent in 1984-85 from 68 per cent in 1983-84, it was still less than the 81 per cent achieved in 1982-83.

# Dimensions for External Activity

**Romesh Thapar**

WHEN Rajiv Gandhi suddenly makes up his mind to play at being Chairperson of the non-aligned and declares his intention to do something about the never-ending Iran-Iraq war, and his country's relations with neighbours, a lot of people in the region imagine that a bright new era is opening. Very soon, however, the whole exercise dissolves into its PR dimensions. No scenarios exist for action on the ground—not even after the latest diplomatic tour.

Whatever the situation, there is a patriotic symphony for ever playing the theme that Pakistan is going to invade India in 1985, nuclear bomb *et al*, something to punctuate the dull refrain about 'foreign hands' dabbling in our problems and the growing threats to national security. There are our Tamilian *netas* calling on India to send the army to save their brethren in Sri Lanka, with lesser fry burning copies of journals which expose our involvements in terrorist activity and training. And there is none other than the experienced Atal Behari Vajpayee getting excited sometime ago about the defence of the fence of barbed wire that Indira Gandhi was busy erecting on the Bangladesh border. Then there is Hinduist Karan Singh for ever moaning the absence of mythical heroes to defend Bharat from her enemies.

This picture in India is matched by the prancings and posturings of the rulers of Pakistan, Bangladesh and Sri Lanka—melodramatics from the weak which are punctuated by offers of co-operation, collaboration and consensus. Pakistan is vivid in its offers of no-war pacts, mutual inspection of military establishments along the border, and force reduction. Bangladesh tries to convince itself that such hate campaigns compel concessions. And Sri Lanka mixes ethnic threats and genocide with love calls. India needs to take the positive offers at their face value, but tends to dismiss them as tactics aimed at playing for time.

Rajiv Gandhi, back from the red-carpet receptions in foreign lands, may now realise that there are dangers in the situation because the rulers of this southern part of Asia are part of a wide democratic turmoil—yes, a turmoil embracing even the military dictatorships. The tendency to exploit neighbourhood suspicions and tensions is strong, because the surge of popular emotion diverts attention, creating and consolidating supportive voting. We should not push these dangers aside because, in a strange kind of way, a number of 'situations' in South Asia are beginning to coincide. And South Asia is a strategic sphere of influence.

In a sense, it is India that has the most to gain from border tensions—and it is India again that has to take the initiative to defuse the trend towards verbal and physical confrontation. This is the meaning of being a responsible 'major power', and not what the scribblers ('experts and non-experts) supporting the arms bazaar would have us believe. It is taking a long time for any organised section of our political life to challenge the bally-hoo that parades as defence expertise in this country.

It is necessary, again and again, to stress the basic foreign policy objective for this country—to move towards viable *detentes* with our neighbours, assuring them by thought and action that the size of India and its present power will never be used against them. Only then will we be able to insulate the region from the international arms bazaar, and begin an overdue demilitarisation. The cost of our defence budgets must be cut if we are serious about our economic problems and our political stability. This may sound irrelevant just when Rajiv Gandhi has been active in the arms bazaar, but he too will realise that apparently plentiful resources can soon disappear in seeking military muscle.

The gentlemen in our Foreign Office are far from such an understanding. Their thinking is very, very short-term, designed to please the political order of the moment, and totally oblivious of perspectives. The newspaper commentaries are equally childish, for they represent by and large the *gup-shup* picked up over coffee sessions in the quiet retreats of the Foreign Office. An unfair judgment? I really don't think so. And I have reason to say so.

If our policy planners see *detentism* as defeatism and are committed to an India that is determined to assert a significant presence in the region, a presence linked to the global spheres of influence which represent a balance of awesome power, then a proper structuring of thought and action in the Persian Gulf area, and in the strategic region of the Indian Ocean, is urgently called for—together with contingency planning for precise interventions in certain situations or crises. At the moment, we are even uncertain about responses over a Pakistani nuclear gadget, a possible Bangladeshi deployment of naval craft received from China, a Sri Lanka blockade of free movement on the seas and a host of other minor manoeuvrings by our neighbours. In a sense, we have been diplomatically defeated, despite the offical prattle.

These matters cannot be left to dubious 'defence experts', journalistic hawks, lobbyists of arms manufacturers and a bunch of retired military and civilian officers who are always present at so-called seminars to air their views with a kind of know-howism that is becoming very suspect. Our neighbours do take fright at the sentiments which dominate these rather repetitive meetings, and nothing can assure them of the irrelevance of this activity.

Basically, whatever the posturings at the level of ruling coterie, or among those publicists who desire to be recognised by the coterie, the country remains largely interested in finding realistic solutions to the problems that act as irritants and tensions-makers in our relations with our neighbours. This is not to say that India lacks the capacity to break the back of any aggression, but to stress that the problems of development and the search for the weapons to dissolve poverty are assuming greater importance in the consciousness of the people. They should in Rajiv Gandhi's mind too.

We speak of many gulfs that have developed during these 38 years of freedom, but few refer to the gulf in perceptions between the rulers and the ruled. Bankrupted and corrupt politicians naturally try to rouse emotions on issues which spark patriotic fervour, but it is possible at last to blunt these tactics and to return the national debate to more vital priorities. When the proper dimensions of our external activity are spelled out, and acted upon, many strange tangles and phobias will lift from the minds of the people of the region.

To this extent, India's role is crucial. We have to see the continuities of our foreign policy, and even as Chairperson of the Non-Aligned Movement open our options to them. To do otherwise would be a commentary on how the commitment to national interests has been submerged by the obsession with image-building, dynasty-making and diplomatic horse-trading. India is not taken seriously any more because the perspectives are not clear. When will we see the facts as they are?

*June 21.*

# Making Third World Pay for Overvalued Dollar

ISG

IF dollar has to stay overvalued, let us impose an import surcharge. That is the conclusion of the Morgan Guaranty economists. The US Congress has already passed a non-binding resolution urging the President to consider imposing a surcharge on Japanese imports.

This shows that even those who are convinced about the substantial overvaluation of the dollar have more or less reconciled themsleves to the view that a major rectification, however desirable, is not practical. Not in the near future, in any case.

Those who talk of practicality have generally in mind the Reagan Administration's stance strongly disapproving of intervention in the foreign exchange market to bring down the dollar. This is the stand the US took at the Bonn Summit.

Of course, the public stand against intervention is no doubt couched in ideological terms. The free market always is the best judge. Really, however, the present stand of the US Administration can easily be shown to be in support of its domestic economic policy. But first let it be made clear that its ideological commitment to free market is as deep or strong as US domestic interests permit. This becomes fairly obvious in the area of foreign trade. The proportion of US imports covered by various non-tariff restrictions, including voluntary restraints informally agreed to by exporting countries, has increased during the five years of the Reagan Administration and will probably increase further in the remaining three years.

But one must also not lose sight of the more important compulsion under which the present US Administration operates and which almost compels it to keep the dollar overvalued. When George Shultz, the US Secretary of State, told his audience at Princeton University that the strong dollar was "altering the character of the American economy in a basic and undesirable way" and that "we cannot count on attracting adequate funds [from abroad] indefinitely" to finance the huge US trade and budget deficits, he was probably distancing himself from the Administration's economic policies. At the same time, one cannot escape noting that the overvalued dollar is the principal instrument of economic policy being employed for covering the country's massive budgetary and trade deficits. In fact I personally subscribe to the view that whatever its public stance, the US is, in reality, deliberately manipulating, and, in that sense, intervening indirectly in, the foreign exchange market and for this purpose the US is making frequent use of its interest rate policy very effectively. I am, therefore, not at all certain that the present US Administration will stand on its so-called ideological grounds with regard to direct intervention in the foreign exchange market, should such intervention become necessary.

This brings me to the other aspect of practicality I started with. Although it is true that the US economy has, in recent years, performed better in terms of both growth and employment than the economies of Western Europe, it is often overlooked that even in the US employment in manufacturing has not been expanding and that it has lately started declining. This phenomenon is attributed principally to the loss of US competitiveness and consequential expansion of imports on the one hand and contraction of exports on the other.

There is today no segment of US industry which does not complain bitterly of the loss of domestic as well as foreign markets to foreigners, thanks to the overvalued dollar. George Shultz was only reflecting the growth of this sentiment, just as did the US Senate when, the other day, it tagged on a rider to the foreign aid appropriations bill—which, incidentally, carries further the Reagan Administration's tilt towards security assistance as distinct from economic assistance—urging the President "to take steps to help reduce the dollar's value" in the foreign exchange market.

Still, given the Regan Administration's commitment to high defence spending on the one hand and no enhancement of tax burden on the other—note the revenue neutrality of the Administration's tax reform package unveiled a few weeks ago—it does make practical sense when someone suggests that as an alternative to devaluation of the dollar—and this will have to be substantial in order to have an impact on the US competitive position—let there be an import surcharge. The point is not whether in theory import surcharge is preferable to devaluation but that, given the situation in which the US is placed today, it appears to be a distinct possibility that the present Administration will opt for the import surcharge.

If this happens, the burden of this surcharge will, I strongly suspect, fall more on Third World exports to the US—for precisely the reasons that the developed countries in general have, in the past, clamped down most heavily on Third World exports in order to protect their industries. While three-fourths of developed country imports of textile and garments emanate from within the developed countries, all non-tariff restrictions apply to imports from the developing countries. Even with regard to the US import surcharge, it is not unlikely that arrangements will be worked out to exempt, partially if not totally, imports from countries with power to retaliate. Only the Third World countries will have to contend with one further handicap.

# Right to Invite Foreign Scholars

### A G Noorani

THE curbs on the visits to India of foreign scholars is now a decade and a half old. Its absurdities are known to all who are concerned with the matter. The lay public knew little of the petty curbs, pettily executed. They did the name of India no good. Devsagar Singh's report in *Indian Express* of June 7, ought to bestir our civil liberties bodies and indeed citizens who take an informed interest in civil liberties: "The Government of India has put new restrictions on the appointment of foreign nationals in Indian universities, their research programme and movement into sensitive areas. All the universities have been asked to keep a strict vigil on their activities and implement the guidelines of the government strictly."

He amplified: "Appointments of foreign nationals could be made only in very exceptional circumstances after obtaining prior clearance of the government . . . Even for inviting a foreign scholar as visiting professor, universities will now be required to obtain prior permission of the government."

Nor is this all. "In case a university proposes to organise an international seminar or symposium, it will have to furnish to the government a detailed note on the theme of the conference, level of participation, name of the countries and their scholars as also the source of funding. The government will have the right to refuse permission."

Subjects like defence, "themes which are politically sensitive" and the like are barred as subjects for research. If foreigners come on a tourist visa they must not conduct research. Lastly, "foreign scholars have also been debarred from delivering any lecture or talk on topics of controversial nature".

Let us take this last directive to begin with. Presumably a Judge of the US Supreme Court visiting India will not be allowed to deliver a talk explaining the Bakke case, on positive discrimination in favour of the Blacks and its aftermath because it might have a bearing on the "politically sensitive" issue of reservations. Nor may he speak on Federal-State relations—also a "politically sensitive" issue.

So much for the casual solitary lecture—what to speak of a series of lectures sponsored by an endowment or a university. Rise further in this ladder of state control of knowledge and you find curbs on seminars, or invitation to or appointment of foreign scholars which make a mockery of the autonomy of universities, flout the country's democratic values and expose the hypocrisy of those who ceaselessly quote Gandhi and Tagore on letting winds from all sides blow freely over our land, trusting one people freely and wisely to choose by themselves, what they think is good for them.

Of course, a CIA which has misused students and academics and academics who have lent their services to the CIA will continue their nefarious activities. There are alas no such exposures of the KGB's ways in the Russian press. That Russian journalists and academics are state propagandists needs little emphasis. The cause of civil liberties is not promoted by denying realities. It is not espoused by the ignorant or the naive. It is best espoused by grappling with the harsh facts of life and yet standing firm by the values of freedom. Our intelligence agencies' failures should not be visited on Indian institutions or the Indian citizen. India should not opt for a closed society. It should ginger up the intelligence services competently to perform their task should any visitor abuse the country's hospitality and indulge in espionage or resort to disruptive activity. It is an equally notorious fact of life that our authorities' definition of 'disruptive activity' is any activity which does not accord with its policies as distinct from the interests of the country—for instance, a lecture on Centre-State relations the world over which exposes New Delhi's usurpation of power by contrast.

Any number of foreigners are allowed the use of the place and even granted government hospitality at the tax-payers' expense—provided they applauded the regime of the day or traduced its domestic opponents. The idiots in the British Labour Party who came here as state guests and applauded the emergency are good examples. Indira Gandhi would not have minded that prize idiot of them all, Michael Foot, going all over the country freely. The authors of that trash "Freedom at Midnight", Collins and Lapierre, were given all facilities. Indira Gandhi's close advisers helped Seymour Hersh who libelled Morarji Desai. But, but, what reception would be accorded a jurist who comes to study the collapse of the country's constitutional system during the emergency?

It is pointless to lament inequity. It is important to stress the legalities—the citizen's right to know, to receive knowledge and information. It is an integral part of his fundamental right to freedom of speech and expression, Article 19(1)(a) and of his right to personal liberty (Article 21). The state has no more right to impose a blanket ban on foreign scholars than it has to impose a blanket ban on foreign literature—books, magazines, newspapers, the lot. The right belongs not to the foreign scholar. It belongs to the Indian citizen. Of course, India will be internationally accountable for these curbs to the International Committee which considers reports of states like India which are parties to the UN's Covenants on Human Rights. The Attorney-General, K Parsaran, received quite a grilling last year. He should be prepared for more next time.

The case of Kleindienst *vs* Mandel decided by the US Supreme Court ought to serve as a warning to the Government of India. Richard G Kliendienst, the Attorney-General, refused to grant a waiver under the Immigration and Nationality Act, 1952—as is required for advocates of communist doctrine—to make Earnest Mandel eligible for a visa to the US. A Belgian citizen, Mandel is a scholar, a professional journalist and an avowed Marxist revolutionary. The government claimed that he had abused opportunities afforded to him during an earlier visit. Mandel and several American academics sued the Attorney-General alleging violation of their right to hear him and engage him in a free and open academic exchange. The court ruled against them by a 6-3 majority.

It turned, however, on the special facts of the case—the Attorney-General's charge of past abuse. The majority held this was bona fide exercise of discretion and did not consider the other issues. Imagine its reaction to a blanket ban. Even so Justices Douglas, Marshall and Brennan dissented.

And even the majority rejected the government's plea that Mandel's books were available, after all. "This argument overlooks what may be particular qualities inherent in sustained face-to-face debate, discussion and questioning", the majority opined. Turn to the opinions of Justice Douglas and of Justices Marshall and Brennan and the arguments and the illustrations they cite—as against the majority's narrow ruling on the special facts—and you realise that curbs of the kind which the Government of India has imposed have not the slightest chance of passing muster even in the Burger Court. It is unlikely that our Supreme Court would uphold them and a crying shame if it ever did.

# Captive Power Will Better Results

**Hansavivek**

*GUJARAT STATE FERTILISERS COMPANY (GSFC)* is expanding and diversifying its activities. Its applications for enhancement of capacity of the ammonia plant to the tune of 1,000 tonnes per day as well as of caprolactum capacity by 30,000 tonnes to 50,000 tonnes per annum are in advanced stage of consideration by the Central government. The company has also approached the government for setting up a nylon spinning unit with a capacity of 3,300 tonnes per annum. Meanwhile, it has made rapid strides in implementing a coastal DAP complex of a capacity of 1.5 lakh tonnes of $P_2O_5$ per annum, as sanctioned by the government. Considering various techno-economic reasons, it has been decided with the approval of the authorities to locate this complex around Sikkaport in Jamnagar district. The site consists mostly of government waste lands, a major part of which has been acquired by the company. The contract for the main DAP process plant has been awarded to Hindustan Dorr Oliver, Bombay, and the work of selection of other major consultants/contractors is in progress and expected to be finalised soon. Setting up of all the necessary infrastructural facilities for development of Sikka port for handling imported raw materials, namely, ammonia and phosphoric acid is being organised jointly by the company and the state government. The scheme of amalgamation of Polymers Corporation of Gujarat (PCG) with the company with effect from January 1, 1983 has been approved by the Gujarat High Court. Attendant formalities for final approval of the Specified Authority under the provisions of Section 72 A of the Income-tax Act and consent of the Controller of Capital Issues for issue and allotment of shares as per the exchange ratio as also the bonus shares, are being completed. The accounts of the erstwhile PCG are incorporated in the accounts of GSFC for 1984. Assets and liabilities as on January 1, 1983 of the erstwhile PCG have been taken over at book value and further, as per stipulation in the scheme of amalgamation, the shares of GSFC will be issued. The excess of liabilities over assets as also the value of shares to be issued have been treated as goodwill.

With a view to mitigating the constraints of power and the consequent interruptions in production, a joint captive power plant of IX 120 MV capacity of Utran in the vicinity of the GEB station is proposed to be put up through efforts of major industries in and around Baroda and Bharuch districts such as GSFC, GNFC, GACL, Petrofils, Heavy Water Project and in collaboration with the GEB and Government of Gujarat. A new company under the name 'Gujarat Industries Power Company' is being set up and financial tie up with IDBI as the lead financial institution is being firmed up towards speedy implementation of this project in which GSFC leads the consortium of participating industries. The estimated contribution by GSFC would be around Rs eight crore.

GSFC has achieved impressive performance during 1984 with fertiliser production at 6.42 lakh tonnes, an all time peak. The company won the Fertiliser Association of India's award for the second time in succession in 1983 in recognition of its performance in phosphatic fertilisers. Melamine production of 3,333 tonnes was also an all time high. The company was able to stabilise caprolactum operations and achieved production of 16,252 tonnes. Production of other products like argon gas, nylon-6 chips, oxo syn gas, san copolymer, etc, are showing a rising trend. These achievements were possible despite stresses and strains on account of a 19-day strike in May 1984, certain major failures of equipment, particularly the failure of the reformer gas boiler of the ammonia plant, failure of the conveyor belt of the AS plant, power disturbances and other problems of ageing plants adversely affecting steady operations. The financial results have also been good with gross profit amounting to Rs 35.81 crore against the previous year's Rs 30.76 crore following an increase in turnover from Rs 193.60 crore to Rs 219.72 crore. These figures also show enhanced margins. With tax liability claiming as much as Rs 12.65 crore (nil), net profit has declined from Rs 23.53 crore to Rs 14.20 crore. A dividend of 24 per

cent is being repeated on the enlarged capital. The distribution is covered 2.85 times by earnings as against 5.90 times previously.

Committed to promotional and extension activities through its various schemes like Leap Forward Project, Intensive Research on Bio-Fertilisers, trials and demonstrations on farmers' fields, soil and water testing facilities, etc, GSFC aims at re-orientation and rejuvenation in the field of agricultural productivity and development of the country as a whole in general and Gujarat state in particular. Adopting a single window concept of serving through its Farm Information Centres (FICs), the company has succeeded in achieving a larger sale of pesticides besides assisting in the construction of about 700 gobar gas plants in the villages of Gujarat. Yet another landmark in its efforts in this direction is the commercial production of bio-fertilisers which provide an extremely economical supplement to chemical fertilisers. A modest beginning was made towards the end of 1984 when a large number of packets of bio-fertilisers were sold/distributed for seeding purposes. Similarly, for the first time in Gujarat, the GSFC has started hy-jowar seed production in fallow lands alongwith hy-castor and maize. Achievement of the highest yield of 6,680 kg/hectare on the rice garden of its R and D farm (against an all India average of rice yield of 2,000 kg/hectare) is indeed gratifying and will provide further impetus to agricultural research and development. There is also a tie up with the Unit Trust of India for sale of units in its efforts in mobilising and mopping up rural savings through its marketing network. Jaykrishna Harivallabhdas, who has been Chairman since the company's inception, resigned as Chairman and Director with effect from March 25 last. The board of directors feels that he was a source of inspiration and the leadership provided by him resulted in all round progress and growth of the company.

*CAMPHOR AND ALLIED PRODUCTS* proposes to manufacture special types of cyanoacrylate and anaeobic adhesives and has entered into a collaboration agreement with Sumitomo Chemical Company of Japan for this purpose. Effective steps are being taken to implement the project. The company has received registration from the DGTD for manufacture of 500 tonnes per annum of butachlor, an important weedicide used on rice. Orders for major equipment required for the project have been placed and the management expects to commence trial production in December next. The company almost completed the implementation of the fenvalerate project by December 1984 but could not commence production for want of registration of product with the Central Insecticide Board. The registration has now been received. Capital expenditure on all these three projects, estimated at around Rs two crore, is intended to be financed by additional borrowings. Accordingly, the borrowing powers of the board of directors are proposed to be increased to Rs 10 crore.

The company has turned in good working results for 1984 with an increase in turnover from the previous year's Rs 10.47 crore to Rs 11.72 crore, followed by a gross profit of Rs 1.67 crore against Rs 1.33 crore. These figures reflect an increase in profit margins. Net profit is Rs 58 lakh (Rs 44 lakh). Dividend is being repeated at 16 per cent and is covered 1.70 times by earnings as against 1.30 times. The increase in turnover was mainly due to better price realisation on sales of menthol, polyterpene resins and other by-products. This, however, was more or less eroded by the sizeable increase in the cost of key raw materials. During the current year, workmen at the factory resorted to an "illegal" strike to get reinstatement of one employee who was dismissed on disciplinary grounds. In order to justify their action they have submitted a charter of demands making certain demands which are already settled under the long-term agreement that is valid upto June 1986. The striking workmen have also resorted to certain destructive activities which have compelled the management to declare a partial lock-out in respect of some workmen. In spite of the strike, the company is running the main plant with the help of some loyal workers and supervisory staff During the period of strike, more than 100 tonnes of camphor was produced.

*ATLAS COPCO (INDIA)* has successfully introduced the screw compressor technology into the country and has now received the necessary approvals to extend this technique to cover the full range of compressors manufactured in India. The project envisages expansion in the manufacturing capacity of air and gas compressors from 720 to 1,720. The company has shown poor results for 1984 with a lower gross profit of Rs 4.22 crore against Rs 4.76 crore in the previous year despite a slight increase in turnover from Rs 25.38 crore to Rs 25.47 crore. Net profit is also lower at Rs 1.60 crore compared to Rs 1.78 crore of 1983. Dividend has been raised by two points to 12 per cent which is covered 2.75 times by earnings as against 3.71 times previously. The turnover did not increase as expected due to a lock-out for three months in the factory of the company's supplier of drill steels. Exports were also lower at Rs six lakh against Rs nine lakh previously due to the market situation abroad. The company produced during the year 562 numbers air compressors against 567 previously. Production of other products was also lower—rock drills and pusher legs 1,818 (2,429), lubricators and grinders 1,951 (3,054), mechanised drilling equipment (sub-products) 287 (398) and couplings 16,857 (19,672). Only output of aqua rigs (sub-products) was higher at 412 (321). Theo Dietz was appointed a director to fill a casual vacancy caused by the resignation of Iwan Akerman. Dietz is presently working as Senior Executive Vice President of Atlas Copco Airpower, the Group's largest compressor factory in Belgium. Considering his knowledge and experience in the development and marketing of screw compressors, the directors consider that his appointment will be of great value to the company. The board of directors has also reappointed Bent Kidegaard as the managing director for a further period of two years, subject to the approval of the Central government.

*BBDO INTERNATIONAL INC*, the world's fifth largest advertising agency, based in New York, has teamed up with R K Swamy Advertising Associates. Announcing this agreement at Madras, Willi Schalk, President, BBDO (Batten, Barton, Durstine and Osborn) International Group, and Geoffrey C Wild, Chairman, ASATSU/BBDO/CLEMENGER Ltd, expressed satisfaction that they had found a partner in India compatible with their thinking and creative philosophy of work. BBDO has over 100 offices in 34 countries and is represented virtually in all the major markets in the world. In 1984, BBDO's worldwide billing exceeded US $ 2.3 billion. *Advertising Age*, the world's foremost magazine of the advertising industry, chose BBDO as the Advertising Agency of the Year for 1984 for its creative excellence. R K Swamy Advertising Associates, which commenced its operation in 1973, has had an impressive growth record and is the sixth largest advertising agency in India. This agreement gives SAA a ready access to markets worldwide for its clients in India and will enable BBDO to service its clients in this part of the world.

# The New Textile Policy

### Mridul Eapen

EVER since the crisis of the mid-sixties which became very severe around late 1974 leading to large-scale sickness among textile mills, there has been a trend both in government and industry circles to emphasise the need for a comprehensive and integrated textile policy which could solve the problems of the industry. A textile policy was announced in 1978, followed by one in 1981 on the plea that the earlier policy had several drawbacks and did not provide for a steady and harmonious growth of the industry.

However, the industry continued to be crisis-ridden, and was worst affected in its oldest citadels; 13 mills were taken over in Bombay following the more than year-long strike by mill workers in 1982-83; in Gujarat 24 mills were closed in 1984 and several others were in a precarious position. Recent figures show that almost 25 per cent of weaving capacity and 15 per cent of spinning capacity in the organised mill sector is characterised as sick. Late in 1984 therefore (preceded, of course, by a number of seminars, *ad hoc* committees and sub-groups on various aspects of the industry) yet another committee was constituted under the chairmanship of the Secretary, Department of Textiles, on October 15, to review the present situation in the textile industry and suggest measures for its development in a long term perspective.

The much awaited policy was finally announced on June 6 (much awaited since it was to have been presented during the last Parliament session). It emphasised the need to increase production of cloth of acceptable quality at reasonable prices to meet the clothing requirements of the population. This, it was felt, had also been outlined in the policy statement of 1981 but had not been achieved: per capita consumption of cloth continued to remain at a low level and sickness had become very widespread. But what is interesting to note is that the policy of 1985 is in no fundamental way different from the earlier policies; it is in a sense the logical culmination of the processes initiated in the last decade, the underlying assumption all along being that the ills of the industry, *viz*, lack of demand and widespread sickness, were mainly due to the absence of freer play of market forces. The process of liberalisation having been given an added impetus by the recent general economic liberalisations, the new textile policy which completely removes all constraints on the textile industry is not therefore, entirely unexpected. However, its measures in respect of sickness, on which a decision was eagerly awaited, allowing mills to contract capacities including by closure of units or parts thereof (and presumably by shifting of units or parts thereof) surpasses all expectations of the industry itself.

The policy has removed all curbs on expansion or creation of new capacity in the mill sector. It may be noted that this process had already started when the 1981 statement made a provision for marginal expansion of capacity in the mill sector oriented for exports. Similarly, constraints on powerlom units which have grown phenomenally (in particular, unauthorised units) have also been removed; the new units have merely to be registered. Despite overwhelming evidence to show that these powerloom units pose a serious threat to handlooms and are not primarily a gradual technological upgradation of the latter, the 1981 textile policy chose to look at this phenomenon within a 'realistic' framework. The decision to authorise all existing powerlooms had been already taken while preparing the Fifth Plan. However, while the latter categorically laid down that no further powerloom units would be allowed to come up, the policy statement of 1981 announced that this sector would be allowed to grow but at a regulated pace so that by the end of 1984-85 the expansion would not be more than 5 per cent over the base year. The latest policy removes even this limited constraint and though it also removes all preferential treatment granted to powerloom units, sufficient data exist on the ability of the latter primarily through low wage costs *vis-a-vis* mills and technical superiority *vis-a-vis* handlooms to compete with the two even without the concessions. Of course *vis-a-vis* the mills their role is more often complementary. However, even amidst all these liberalisations, the policy still clings to the government's avowed objective of preserving the distinct and unique role of handlooms, based on a measure which raises serious doubts about its intentions: all controlled cloth is to be produced by the handlooms.

The policy with respect to controlled cloth production is a fulfilment of what was envisaged in the 1978 textile policy statement. Yielding to the pressures from the stronger sections within the textile industry, the government at that time had reduced the controlled cloth obligation of the private mill sector virtually to zero by transferring it to the mills under the National Textile Corporation; to be ultimately taken over by the decentralised sector, especially handlooms. This in fact is going to be the major plank of support for the handlooms in the present policy. A review of the chequered career of the controlled cloth scheme since its inception in 1964, the failure of the official machinery to cajole or coerce the mill sector into fulfilling its social obligation, exemption granted initially to weaker mills, the continuous reduction in the quantum of production, its intermittent cessation and subsequent revival with the 1981 policy (the quota prescribed now, 650 million metres, was the quota laid down in the 1981 policy)—all these make one skeptical about the ability of the handlooms to fulfil this obligation without a substantial step up in subsidies. (No doubt, exempting the NTC mills now from fulfilling this obligation must have been prompted by the large amounts of subsidies absorbed by these mills.) Added to this is the distributional problem. Recent reports indicate that the limited amount of controlled cloth that does get produced does not become available to the poorer sections of the population but finds its way to the wholesale cloth market and is sold much above the controlled prices.

The policy emphasises that, unlike in the past, it will view the textile industry not in terms of various sectors—handlooms, powerlooms and mills—but in terms of the stages of the manufacturing process—spinning, weaving and processing. This is in fact a corollary to the removal of all curbs on the mill and powerloom sectors. Since each sector is now allowed to grow on the basis of its inherent strength and not by any design or purpose, one automatically refrains from classifying the industry into sectors with the exception of handlooms which could now possibly be identified with the controlled cloth sector.

In respect of fibre mix, the policy affirms the increasing trend towards non-cotton fibre use. In keeping with the removal of all constraints on the mill sector, the constraints on fibre use—mills cannot produce pure man-made fibre fabrics—are also done away with. In this sphere one may expect to witness fierce competition between the larger well known names in the powerloom sector and the larger well-known mills.

It is envisaged that the increased use of man-made fibres through a reduction in excise duties would lead to a rise in the demand for textiles as there is evidence of large unsatisfied demand for durable synthetic and blended fabrics at cheaper prices. This together with the production of controlled cloth is expected to raise per capita consumption of textiles to higher levels. The problem with controlled cloth has been mentioned earlier—the possibility of actual achievement being far short of targets. In the case of man-made fibre cloth, it must be noted that the pent up demand is really for the synthetic fibre fabrics—whose prices would have to register a very sharp fall (or in other words excise duties would have to be reduced very drastically) to enable even the lowest income groups to purchase these fabrics. This implies not only reduction in government revenues, but would also adversely affect the cotton economy besides facing stiff resistance from the better off sections in the industry, reaping high profits in the production of such fabrics.

Lastly, the policy by granting complete freedom to mills in closing/shifting units has, needless to say, severe implications for the working class. The recent Delhi Cloth Mills episode is a case in point. There is no guarantee that the interest of the workers would be protected if a mill is closed; even if the mill contemplates a shift, obviously with plans of modernisation, given the recent trends in the latter, the new requirement of workers could very easily be less than one-third of the original numbers. Hence workers' interest would only be protected through workers' struggles, as the DCM case has demonstrated though what impact this new policy would have on this particular company's move remains to be seen.

Hence one is not sure how far this complete liberalisation in textile policy would help in achieving the basic objectives. It would certainly enable the fittest to survive and perform even better.

## ANDHRA PRADESH

# More Police Killings

**M Shatrugna**

THOUGH police killing of political activists and common people has become a 'normal' feature in the country, the Andhra Pradesh police is far ahead in this sordid activity. In a span of 20 weeks the police have killed 33 persons due to "various reasons". Of those dead, 17 have died in "encounters", 12 in police custody and four in police firings. Last year, 24 persons including three naxalites, had died in police custody after prolonged torture. Of the 33 killed in the first five months of this year, 13 are naxalites, four their sympathisers and two student activists connected with the Left movement. The rest include one stone-mason, one bangle vendor, one tailor, one petty trader, one municipal employee, two petty thieves, three peasants, one Congress(I) Upa Sarpanch and four others.

Generally when a killing takes place, the police adopt two methods to suppress the details of the incident. Firstly, they suppress the background information about the deaths and prevent civil rights activists and organisations from collecting the data. Secondly, they suppress evidence by disposing of the bodies of those killed under police supervision. In this macabre drama, post-mortem is conducted on the spot by the government doctor and the body cremated. The body is not handed over to the relatives of the victim. In 20 out of the 33 cases, the bodies were not handed over to the relatives of the deceased. In many cases, the relatives were not even informed of the death.

When a magisterial enquiry is ordered, the witnesses deposing on behalf of the deceased are intimidated. In the Kondapur case, in which five had died, the key witness was illegally detained until the enquiry was over. In the Bommireddypalli encounter, the wife of the victim (Rajalingu) was forced to give a flase deposition before the Msgistrate. In all the cases, a large contingent of policemen is positioned near the site of the enquiry to scare away the people wishing to depose. At Chirala and Baswapur, the enquiry proceedings were held 'in camera'. Pressmen and civil liberties activists were barred from entering the area. When a civil rights team led by the Janata leader George Fernandes complained to N T Rama Rao about the encounter deaths at a meeting with him on June 11, the Chief Minister innocently 'assured' the delegation that such killings would not be permitted in future and that peasant organisations like the Ryothu Cooli Sanghams would be allowed to function without state interference.

The Andhra Pradesh Civil Liberties Committee which enquired into the 33 cases of police killing has prepared the following list of the dead:

| Sr No | Date of Killing | Name | Place | Background of the Victim | Brief Description of the Manner of Killing |
|---|---|---|---|---|---|
| (1) | 21.1.85 | Sarangapani (18) | Warangal town | Youth activist | Chased from his house, caught at the outskirts of the town and beaten to death. |
| (2) | 21.1.85 | Khairi Gangaram (40) | Pembatla, Jagtial tq Karimnagar dt | Peasant activist | Police surrounded the house where he was sitting, climbed onto the roof, removed some tiles and shot at him. |
| (3) | 10.2.85 | Venkatesh | Himayatsagar, Ranga Reddy dt | Stone-mason (Waddera) | Police were chasing a man named Guravaiah. He escaped but they fired upon some labourers coming in the opposite direction and killed Venkatesh. |
| (4) | 17.3.85 | Maram Yellaiah (50) | Lakshettippet, Adilabad dt | Peasant | Yelliah went to the police station to lodge a complaint. The SI was not there and the sentry asked him to go away. When he insisted on waiting, the sentry fired at him and killed him. |
| (5) | 28.3.85 | A Venkateswara Rao (28) | Veerabhadraram, Bhadrachalam tq, Khammam dt | Peasant activist | Police raided the hut where he was resting and as he got up and ran, they chased him and shot him dead. |
| (6) | 6.4.85 | Bhukya Kishan (40) | Ghanpur Tanda, Kamareddy tq, Nizamabad dt | Lambada peasant (tribal) | He was chased three kilometres from his house and shot dead as his family watched. |
| (7) | 10.4.85 | G Appa Rao (25) | Narsapur, West Godavari dt | Suspect in a theft case | Beaten to death in police lock-up. |

*(Table continued on next page)*

| Sr No | Date of Killing | Name | Place | Background of the Victim | Brief Description of the Manner of Killing |
|---|---|---|---|---|---|
| (8) | 11.4.85 | Gotte Raghupati (25)<br>Pani Sathaiah (23)<br>Banda Gangiah (25)<br>Tadu Rajaiah (25)<br>Vuppala Lakshmirajam (24) | Venkatraopet, Vemulawada tq, Karimnagar | Peasant activist<br>Peasant activist<br>Peasant activist<br>Peasant<br>Peasant | These five persons and one other were sleeping in the village fields at night when the police came, woke them up and tied their hands behind their backs and fired at them point-blank. A sixth person escaped. |
| (9) | 14.4.85 | Parvath Hoth (75) | Nakrekal, Nalgonda dt | Itinerant bangle-vendor | Arrested along with a large group of vendors on a theft charge. Died during interrogation. |
| (10) | 17.4.85 | Pamu Hanumanthu (45) | Yeldurthi, Medak dt | Peasant | Arrested on arson charge, and kept in illegal detention for ten days during which period he died. |
| (11) | 25.4.85 | Namdev (54) | Rudraram, Medak dt | Samll trader | Police raided an assembly of villagers who were discussing the problem of a sorcerer in the village, called out Namdev, and killed him. |
| (12) | 27.4.85 | A Prabhakar Rao | Chirala, Prakasam dt | — | Suspect in a case. Tortured to death in police lock-up. |
| (13) | 30.4.85 | D Narsinga Rao (30) | Uppuguda, Santhoshnagar PS, Hyderabad | Employee of Hyderabad Municipal Corporation | He was involved in a quarrel with the proprietor of an illegal liquor shop owner, who beat him up and handed him over to the police who beat him further and killed him. |
| (14) | 1.5.85 | Rajanarsu (25)<br>R Babu (24) | Baswapur, Domakonda tq, Nizamabad dt | Peasant activists | Five activists were resting on the outskirts of the village. Police came and fired, injuring Babu. As the others ran, police fired and killed Rajanarsu. Injured Babu was killed later. |
| (15) | 1.5.85 | Ganeswar (22) | Moinabad, Ranga Reddy dt | Tailor | Arrested on suspicion of having murdered his younger sister, and kept in illegal custody for 24 days and tortured to death |
| (16) | 6.5.85 | Rajab Ali (30) | Harbour PS, Visakhapatnam | Allegedly a habitual offender | Arrested in a theft case and beaten to death in lock-up. |
| (17) | 7.5.85 | P Rajalingu (30)<br>Siddaiah (25) | Bommireddypalli, Sultanabad tq, Karimnagar dt | Peasant<br>Peasant activist | Siddaiah had gone to Rajalingu's house on May 6 night, taken food and slept there. Police came in the night, woke them up, took them to the fields and shot them. |
| (18) | 13.5.85 | P Madhunaiah<br>A Ramesh | Lodvelli, Kagazahnagar tq, Adilabad dt | Peasant activists | Police raided the village and fired upon activists sitting in a hut and killed them. |
| (19) | 15.5.85 | I Amarender Reddy (19) | Kamareddy town, Nizamabad dt | Student activist | Caught in the street while enforcing a bandh in the town, was beaten to death at the road junction. |
| (20) | 16.5.85 | — | One person died in police lock-up at Khamam. | | No details available. |
| (21) | 23.5.85 | Kamal Peeran (65) | Yellanur, Tadipatri tq, Anantapur dt | Cong (I) Upa Sarpanch of Yellanur | Arrested on gambling and other charges and beaten to death in the lock-up. |
| (22) | 26.5.85 | G Narayana | Chinnanakkalappalli, Jagtial tq, Karimnagar dt | Peasant activist | Police raided a Panchayat (arbitration) being conducted by Narayana and another activist and chased and killed him. |
| (23) | 27.5.85 | P Bhupati Reddy<br>K Saraiah | Narsapur, Mulug tq, Warangal dt | Peasant activists | They were arrested at 10.30 P M from the house of their advocate at Warangal town, taken to Narsapur and killed. |
| (24) | 28.5.85 | Govinda Reddy | Jagtial, Karimnagar dt | Peasant activist | He was arrested from a house on the outskirts of Jagtial town and taken out of the town and killed. |
| (25) | 4.6.85 | Shankaraiah (13) | Marikal, Amarchinta tq, Mahbub nagar dt | Youth | The villagers were agitating for Mandal status for their village. The police fired upon them and killed him. |

UNITED KINGDOM

# Immigration Controls and Racism

**Michael Jacobs**

LAST month's judgment by the European Court of Human Rights that Britain's immigration rules are unlawful because they discriminate against women comes at a time when the Conservative government's immigration and race policies in general are under increasing attack. A recent report by the (government-financed) Commission for Racial Equality declared that the immigration rules were "racist in operation"; while the disclosure that queues of applicants to enter Britain in the Indian sub-continent were being maintained deliberately to control the numbers of Black immigrants has led to legal action being initiated against the government by the National Council for Civil Liberties.

But the government's response to the European court's ruling, as to previous criticisms, will be to tighten, not liberalise, the regulations. Its hardline attitude has been demonstrated again in the last few weeks with the imposition of visa requirements on Tamils seeking refuge in the UK from communal violence in Sri Lanka, and the deportation of those already arrived.

Following the court's judgment that it breaches the European Convention on Human Rights, the government will be forced to change the rule which allows non-British resident men to be joined by their foreign wives or fiancees, but not women by their husbands. But the government is likely to make the rules tougher for all immigrants rather than easier for women. In particular, it may seek to extend the controversial 'primary purpose' test. Under this rule, husbands must prove that they have not married for the 'primary purpose' of admission to Britain. The rule is widely felt to be racist, since it is applied only to immigrants from India, Pakistan and Bangladesh, where arranged marriages are customary. From its introduction in January 1983 to last September there were 3,900 applications from husbands and fiances of British women from the sub-continent. Of these, 1,850 were refused, over 60 per cent of which on the grounds of the primary purpose test. In all the cases, the 'Entry Clearance Officers' accpeted that the arranged marriages were genuine, and that the couple intended to live together permanently; but the man was disqualified solely because he could not prove to the officer's satisfaction that his primary purpose in marrying was not entry to Britain. The burden of proof lies with the husband not with the officer. The UK Immigrants Advisory Service has already begun proceedings against this rule in the European court, on grounds of both racial discrimination and its attack on the right to marry according to choice and to live in the country of citizenship. Hundreds of families have been divided by its operation.

The rule is just one aspect of immigration policy criticised in the Commission for Racial Equality's report, the result of a four-year investigation. The Commission found that the "excessive emphasis" placed by the government on restricting and controlling immigration threatens the legal rights and harms the interests and welfare of those with a legitimate claim to come to the UK. Restriction is applied almost exclusively to Black people: at UK ports of entry one in 140 visitors from the New Commonwealth is refused entry compared to 1 in 4,100 from the Old Commonwealth (Australia, New Zealand, Canada). The report published confidential Home Office memoranda and files showing that crude racial stereotypes were used by immigration officers, and racist comments made about individual immigrants: the Home Office acknowledged that these "might indicate a less than objective approach". (The office in fact tried to stop the CRE's enquiry, asking the High Court to declare immigration policy outside the Commission's powers, and then withholding publication of the report for a year after is completion.)

The internal Whitehall briefing on immigration procedures leaked last month confirmed the racial discrimination in British government policy. It revealed that the number of Entry Clearance Officers dealing with applications from the Indian sub-continent (but not elsewhere) is "the primary regulator" of Black immigrant numbers. The briefing described the system as "a policy of deliberate delay without legislation, giving powers to impose quotas". It warned that if the policy were acknowledged publicly by the government as a quota system it would be illegal under British law and the European Convention on Human Rights.

The queues are long: for dependents the waiting time is now 22 months in Bangladesh, 11 months in Pakistan and Delhi. Even then 42 per cent of applications are turned down; 50 per cent of elderly parents wanting to live with children in Britain are refused. They have no right to be present at their own appeals. For UK citizens in India—those *already* holding British passports—there is an even longer delay in obtaining the "special quota voucher" giving the right to come to Britain, now upto eight years. (By contrast, the White South African athlete Zola Budd was made a British citizen in just six weeks last year.)

The delays cause great hardship for the people involved. On arrival in Britain immigrants are frequently detained for months in poor conditions in remand centres pending investigation of their cases; six years ago it was revealed that women coming to marry in Britain were subjected to humiliating 'virginity tests' at Heathrow Airport to ascertain whether they were 'genuine'. Deportations of 'illegal immigrants' are common, even though in many cases the families have lived and worked in Britain for years. In several well publicised cases, long-standing residents have been declared 'illegal immigrants' and deported or threatened with deportation because many years before they had not disclosed information for which they were not asked and which they did not realise was required. In others, British children of deportees have been forced to choose between remaining in Britain, their only home, and being separated from their parents, or leaving with them to resettle in countries they have never even visited.

Several of these cases result from the Conservative government's 1981 Nationality Act, which in creating new categories of UK citizenship has removed the automatic right of residence in Britain from thousands of East African and Asian passport holders, including many already settled in Britain. The Act has caused understandable insecurity amongst Black communities. A particularly disturbing effect has been the increasing tendency for Black people to be subjected to passport checks at social security offices and in the National Health Service to prove their citizenship. Frequent examples of welfare benefits being wrongfully denied have shown up the intimidatory as well as degrading discrimination in this practice.

The government argues that immigration controls—which have been applied in the past with equal rigour by both Labour and Tory administrations, though the Labour Party is now pledged to repeal both the 1981 Nationality Act and the 1971 Immigration Act—are necessary to maintain good race relations in Britain. It claims that 'excessive' immigration cannot be supported at a time of high unemployment. But this is disingenuous at best, since the rate of *emigration* from Britain is considerably higher than that of immigration. Primary immigration from the New Commonwealth and Pakistan effectively ended in the mid-1970s; it is now almost entirely a small number of dependents the government seeks to exclude. And these are almost all Black people. While many Asian British passport holders are barred, an anomalous provision in the rules has been retained to allow non-UK passport holders with one British grandparent—i e, White nationals of the Old Commonwealth—indefinite entry.

Indeed Black organisations in Britain argue that the government's obsession with numbers, 'illegal immigrants' and control directly fosters racial discrimination and tension. They point to Margaret Thatcher's notorious remark a few years ago about Britain being "swamped" by Black immigrants. The constant questioning of the rights and status of Black Britons—who now number about 2 mn, or four per cent of the population—feeds the racism which continues to flourish in British society.

Having been brought to the UK as a reserve labour force to fill an economic gap in the booming 1950s and 60s, Black people, of both West Indian and Asian origin, have always been at the lower end of both occupational class and income scales. Now, in the recession, they have been first on to the dole queues. Unemployment rates for Black people are substantially higher than for Whites: in certain inner-city areas frequently surpassing 50 per cent. Black people live in generally worse housing, often due to local Councils' deliberately discriminatory policies. West Indian children, in particular, have lower educational attainments. A recent Government Committee of Enquiry found that this was mainly due to socio-economic deprivation, itself caused by racism in society at large. The report also condemned the "institutionalised racism" of the education system, which they described as being geared to White children, frequently failing to meet the needs of Black pupils.

In the last few years, with the growth of unemployment and inner-city decay, racism has taken particularly nasty forms. There has been a major upsurge in racist harassment and attacks against Black people in several English cities, including (East) London. The neo-fascist National Front has been behind many of them. Excrement has been put through Bengali families' letterboxes, windows smashed and abusive graffiti written on walls; individuals have been attacked. In many areas Asian residents have complained that they receive no protection or redress from the police, and have set up their own 'vigilante' groups to patrol the streets. In other areas, such as Brixton in South London, it is the police themselves who are accused of harassment, using 'stop and search', detention and entry powers to intimidate young West Indians on the streets and in their homes and clubs. It was against the police that the 'race riots' of 1981, in Brixton and elsewhere, were principally directed.

The riots were effective in exposing the poverty of the inner city areas, and small amounts of government money were subsequently directed towards their 'regeneration'. In particular efforts have been made to create a 'Black bourgeoisie' of shopkeepers and small businessmen, divided off from the majority of Black people still regarded as a reserve manual labour force. There is a strong business tradition amongst some of the Asian communities. But young Blacks have by and large refused to join either class. They have noticeably failed to take up the government's 'entrepreneurial' inducements, and they have been increasingly unwilling to participate in 'training' schemes which 'discipline' them only for the dole.

Black organisations have become correspondingly militant, determined to gain political representation and influence on their own terms, not merely through the 'race relations' lobby identified with White efforts at appeasement. At a local level, they have pushed the labour-controlled Greater London Council into policies positively discriminating in favour of Black people, and attacking racism; other local councils have followed suit. The Labour Party itself is under pressure to allow the formation of 'Black sections', in which Black people can find an effective voice: there are still no Black MPs in Parliament, and very few Black local councillors. And there has been a major growth of Black cultural activity, in books, plays, music and dance—much of it overtly political.

These developments will inevitably make their mark in British society. In many ways they are the backlash of that society's own past. For Britain built its wealth on colonialism, and enjoyed a temporary post-war boom on the back of colonial immigration.. It is now being forced to face up to its own history. Immigration controls and racial harassment against Black people in Britain are traditional defences. But they are unlikely to be accepted as peacefully as they have been in the past.

## Bank of India

BANK OF INDIA showed steady progress and good performance in all key areas of business during 1984. It opened 80 new branches in India (36 rural, 6 semi-urban, 28 urban and 10 matropolitan) taking the total number to 1,764. The Bank's global deposits expanded by Rs 1,087.05 crore to Rs 6,0281.83 crore. The aggregate deposits in India expanded by 19.7 per cent against the previous year's growth of 17.8 per cent. Global credit portfolio expanded by Rs 551.91 crore to the year-end outstanding figure of Rs 3,779.20 crore. The outstanding credit within India recorded an increase of Rs 417 crore, inclusive of Rs 73 crore in food procurement. The Bank's advances to priority sectors increased by Rs 157 crore and reached the outstanding level of Rs 964.30 crore, which worked out to 38.8 per cent of total credit. As many as 1.2 lakh accounts were added during the year taking the total number of priority sector accounts to 9.8 lakh. Identified weaker sections within priority sectors *viz* beneficiaries of the Integrated Rural Development Programme (IRDP) and of Differential Rate of Interest Scheme (DRI), small/marginal farmers, scheduled castes/tribes and village artisans, craftsmen and cottage industries were extended assistance totalling Rs 181.32 crore which represented 18.7 per cent of priority sector credit and 7.3 per cent of total credit.

The Bank sponsored five new Regional Rural Banks raising the number of RRBs to 16. The new banks sponsored during the year are: Solapur Gramin Bank and Bhandara Gramin Bank in Maharashtra, Giridih Kshetriya Gramin Bank and Hazaribagh Kshetriya Gramin Bank in Bihar and Indore-Ujjain Kshetriya Gramin Bank in MP. These 16 RRBs opened 207 new branches taking the total number of their branches to 610. The combined deposits of these banks expanded by Rs 19.78 crore to Rs 54.49 crore and their credit portfolio rose by Rs 13.36 crore to Rs 42.42 crore. The Bank's Merchant Banking Department processed 22 merchant banking assignments during the year. Of these four each were for syndication of loans and management of public issues. The Bank earned a net profit of Rs 5.30 crore.

# Agrarian Reforms: A Nostalgic View

**V M Rao**

**Agrarian Reform in Contemporary Developing Countries** edited by Ajit Kumar Ghose; (An ILO-WEP Study), Croom Helm, London, 1983; pp 364.

THERE was a time in India in the immediate post-Independence years when agrarian reform was the cynosure of all eyes. Politicians dreamed about agrarian reform, governments drafted and implemented impressive legislation and researchers were eager to document the revolutionary changes which everybody expected to occur. But, even before the first decade of planning was over, the emerging food crisis compelled the policy-maker to turn to strategies—like the package programme—which were lukewarm in their attitude towards any structural reform of rural society. Later, the euphoria over the 'green revolution' raised visions of agricultural prosperity breaking through all institutional barriers and making modernisation a painless—and even a pleasant—process. No euphoria lasts for long but in the Indian case the waking up does not quite appear to have restored the old mood of reformist zeal. Currently, the theme of agrarian reform seems to evoke a host of nostalgic memories but little genuine enthusiasm as a development strategy for the future.

The agrarian reform scenarios presented in the book under review seem to follow rather closely the Indian experience, *viz*, exaggerated expectations leading to seemingly sweeping reform proposals but followed by achievements too modest to sustain the credibility of agrarian reforms as a development strategy. The book covers six developing countries—India, Ethiopia, Peru, Chile, Nicaragua and Iran. The reader will notice that some of these countries are currently in the news for the wrong reasons—Ethiopia for the famine, Iran for a protracted war and Nicaragua for a brave confrontation with the superpower in its neighbourhood. The reforms covered are those implemented during the last about three decades. A period as recent as this has both advantages and disadvantages in analysis. The legislative and implementational processes become easy to observe in detail. But, on the other hand, the structural changes brought about by the reforms are more difficult to evaluate when the reforms are too close to us in time and major disturbances intervene to disturb and distract the changes set in motion. This is a particularly severe handicap for the book under review. The cases it selects belong to what may be regarded as the 'radical' end of the reforms spectrum; Ethiopia, Peru, Chile and Nicaragua are selected as developing countries moving 'on the road to collectivism' while Iran is chosen for a reform strategy focused on instant 'modernism'. In all these cases, the crucial point to know is the extent of genuine structural change in rural society achieved by the reform, but it is precisely this point which remains clouded in guesswork owing to the recentness of the reforms and, also, owing to the reliance of the studies on official documents and statistics with limited information content.

The book includes two studies on the Indian experience—Kerala and West Bengal. The Indian reforms are viewed in the book as working towards strengthening 'peasant economy systems' and, apparently, they have been included as representing a reforms approach based on gradualism as compared to the sharper break with the past visualised in the other cases covered in the book. Incidentally, the regional diversity in the changing agrarian structure in India suggests an alternative way of looking at the role of reforms in bringing about agrarian change. There are well-marked areas in India, like Punjab, characterised by vigorous agricultural growth and modernisation. It would be interesting to ask how this process came about and what were its interactions with the agrarian structure. The book has identified, categorised and selected cases on the basis of the characteristic features of the reform situations and legislations. This is a tricky procedure relying in part on the formal objectives and goals of legislations which, as the studies in the book themselves show, are often at variance with the implicit goals motivating the groups implementing the reforms. As an alternative, one could proceed to identify areas on the basis of broadly known trends and changes in the agrarian structure and, then, investigate the role played by reforms in these changes. This is not a procedure without drawbacks but it occurs to us that it might be useful as a complement to the procedure adopted in the book.

The studies presented in the book are rich in details which could be of particular interest to economic historians and researchers working on socio-economic structures in the developing world. We find it practicable to confine the review to a single question: Do the developing countries have agrarian structures which are 'reformable' enough through agrarian reforms? Let us see how the authors of the studies themsleves respond to this question.

*Kerala*: "It should be evident from [our] analysis that nothing definitive can be said about the impact of agrarian reforms on poverty in Kerala . . . the scale of poverty is likely to have gone down significantly between 1956-57 and 1972-73, both on account of the redistributional effects of land reform and the relatively high rate of growth of agricultural output during this period; and that, if the gains of this period have been subsequently maintained, it could only have been due to other extraneous factors such as improvement in the terms of trade of Kerala and the considerable inflow of remittances from migrants . . . This cannot last very long, unless the opportunity is used for strengthening the technological basis for more rapid agricultural growth in the future; the land reforms that have been implemented provide a sound institutional framework for such strengthening but cannot obviously be a substitute for it."

*West Bengal*: "The agrarian reform programmes does address itself to the fundamental problems facing the agrarian economy. It aims to curb landlordism, and thereby aims to promote a repeasantisation of the economy. It aims to improve the lot of the rural poor through such measures as a reduction in landlessness, an expansion of employment opportunities and an increase in rural wage rates. It aims to free the small cultivators from the clutches of usurious money-lenders through the creation of special credit facilities . . . The concrete achievements so far, though considerable, have been inadequate . . . If the benefits of the current measures are to be consolidated and built upon in the longer run, conscious efforts must be made to develop co-operative or joint farming at the next stage. This is necessary not only for pre-empting a renewed process of polarisation of income and wealth, but also for facilitating the adoption of modern technology which is essential for growth."

*Ethiopia*: "The proclamation [issued in 1975 after the 1974 revolution] sought to eliminate the most fundamental problem of Ethiopian society once and for all, by means of reforms leading to egalitarian distribution. Land was not only to be distributed to those who actually tilled it, but the concentration of land in a few hands was also effectively barred: a ceiling was established on landholding, and the enlargement of holdings through purchase or lease was prohibited. Not only was tenancy abolished, but so also was the use of hired labour by individuals, thus firmly closing the door for any possibility of exploitation of the many by the few . . .

The provisions of the proclamation were to be implemented by peasant associations to be organised with a minimum command area of 800 hectares. [It is envisaged that eventually the cultivators will be covered by the producers' co-operatives.] . . . the agrarian reform has indeed greatly benefited the peasantry; a survey shows that out of a random sample of 295 peasants from eight peasant associations interviewed, a vast majority indicated that they were materially better off than before. It must, however, be said that a systematic assessment of the impact of agrarian reform has yet to be undertaken; and, again, it is not only the immediate effects but also the long-term impact on national and rural development that will prove its success."

*Peru*: "Peru's agrarian reform remains to date one of the boldest experiments of its kind in Latin America. It effectively destroyed the hitherto existing oligarchical order and created a new institutional framework which, in spite of its weaknesses, was eminently suitable for pursuing simultaneous growth and equity . . . [however], in retrospect, it would seem that the failure to rally the peasants and workers around its central goals has proved to be one of the basic weaknesses of the whole reform programme. In the absence of a genuine mass participation, the collective-cooperative model had to be imposed from above and was perceived as a constraint by the very people it was supposed to benefit. The reforms have undoubtedly dismantled the old order in the countryside and have gone some way towards creating an environment in which growth and equity are compatible objectives. But there is no denying that they have so far largely failed either to stimulate production or eradicate rural poverty . . . General economic policies of the state must bear a major responsibility for the poor performance of the post-reform agrarian economy . . . the 'import substitution industrialisation strategy' discriminated against the agricultural sector. The foreign exchange policy favoured agricultural imports even more than before and penalised agricultural exports . . . The government's cheap food policy not only negatively affected rural incomes but also, by reducing agriculture's profitability, indirectly affected investment, production and employment in this sector . . . The agrarian reform [statist-cooperativist type] by itself could not overcome the negative effects of these economic policies."

*Chile*: The reform in Chile consisted of a programme for redistribution of land inspired by the 'structuralist position' that "agricultural stagnation" (and economic stagnation in general), as well as the inflationary process, could be reversed by a redistribution of land. The precise form or mechanism of redistribution, and above all the precise or even the broad outlines of the institutions of production to follow upon such a reform were, significantly, not considered in detail. [It was hoped that] agrarian reform would transfer land from those who used it extensively to those who used it intensively. This would, at the same time, expand the internal market for manufacture through raising the incomes of the new property holders. Growth of production and market expansion would fuel economic growth in general and reduce inflation." The Chile study observes that "seen from the vantage point of 1980, [these assumptions] seem naively optimistic but they express well the climate of opinion of the time in Chile". According to the study, "the distributional consequences of the reforms over the period 1965-73 can perhaps be summed up as follows. The major losers were the *hacienda* owners and the major beneficiaries were the permanent workers. The temporary workers and small holders were unlikely to have benefited much. Thus, although the overall distribution of income in rural areas improved, the distribution among rural workers may well have worsened . . . the medium-sized farms [constituting] the most dynamic element in Chilean agriculture have been the real beneficiaries of the tortuous reform process which began in 1965." The major change in the agrarian structure, as judged by the study, was "a transformation from a system dominated by huge *haciendas* based on large contingents of tied labour to a system dominated by medium-sized capital-intensive farm units based on wage labour".

*Nicaragua*: "The Nicaragua agrarian reform programme (initiated after the Sandinist Victory of July, 1979) involves a process of transition from private farming to state-owned and co-operative farming . . . [our] analysis only covers the first two initial years of a land reform programme that is still in progress . . . the measures to control the agricultural surplus enabled a redistribution of rural incomes, but mainly to the small-scale farmers. Landless workers, comprising one-third of the rural labour force, very likely experienced a decline in their real incomes. Food production expanded substantially reaching historically unprecedented levels, while agro-export production, particularly that of cotton, did not attain the targeted level of the 1980 Economic Plan. This has been one of the reasons why the foreign exchange balance has worsened considerably."

*Iran*: "Initially [in 1962] the land reforms in Iran had intended to reduce the size of large holdings, distribute land and institute rural co-operatives among the peasants who had traditionally cultivated the land without always owning it . . . [But] Shah—being both worried about the immediate reaction of large land-owners and conservative religious leaders and, more importantly, afraid of the success of the reformist government for his own position and power—decided to take over the idea and present it as a part of a wider 'modernising programme'. The immediate consequence of this was to dilute the terms of the Land Reform Law in favour of large land-owners, and turn its second stage into a tenancy reform programme as opposed to a land redistribution programme . . . In line with purely bureaucratic and technological blueprints for 'modernising' the whole of the economy, it was decided to impose a system of 'farm corporations', that is, joint-stock agricultural companies sometimes consisting of several villages, and then to promote agri-business complexes—i e, extensive farms based on foreign and domestic capital and wage labour . . . The parallel strategy of rapid urban 'industrialisation' generally discriminated against agricultural development. Of the funds allocated to the agricultural sector, direct state investment was channelled primarily into agri-business companies, while most of the state credit and loans were granted to farm corporations. The peasants, constituting 55 per cent of the country's population and operating 82 per cent of the cultivable area, were left to obtain what credit they could through the complex bureaucratic network of co-operative units or, more often, from the local usurers and merchants."

The study describes the performance of the agri-business complexes and of farm corporations as disappointing. Further, "the extension of the central bureaucracy to the villages, and the official contempt for the peasantry which was amply reflected in the attitude and behaviour of local officials, created social instability, economic insecurity and psychological resentment among the peasants. An important consequence was the disappearance of the *Buneh*, the traditional production commune, with its indispensable functions of putting small and fragmented holdings under the same crop, maintaining and extending the artificial irrigation networks and distributing water among the cultivators . . . Meantime, the explosion of the oil revenue was raising urban living standards [providing] a strong incentive for peasant migration into towns. However, the ultra-modern technology applied to modern manufacturing and service production, even road construction, left little employment opportunity for purely manual labour, migrant peasants had no capital of their own and they were completely alien to the urban culture. The rapid rise of urban food and dwelling prices resulted in hunger and homelessness of the immigrant peasants. Thus, both in villages and in towns the scales were drastically turned against the Iranian peasantry, resulting in extensive undernourishment in a country with a per capita income of US $ 1,700 per annum. This was the context in which the revolution of 1979 took place."

The brief scenarios sketched above in the authors' own words are only intended as curtain-raisers on the complex reform processes analysed in the book. As may be expected, each country has its own distinctive features with regard to the historical setting and social structure, the turn of events leading to agrarian reforms and the dominant groups planning and implementing reforms. The book is likely to place the reader in an unenviable position—sorely tempted to generalise but seeing many hazards in doing so. But, yielding to the temptation and undeterred by the hazards, we would like to share with the reader one disquieting—and thoroughly unrevolutionary—thought: the developing countries seem to have a fairly low ceiling on the changes in social structure achievable through agrarian reforms. Reforms with a small r—like those in West Bengal and Kerala—appear to remain below the ceiling and get implemented without much disturbance and with some achievements to their credit. Reforms, with a capital R—thorough-going redistribution of land, collectivisation or its variants, modernisation at a forced pace—tell a different story. They try to break through the ceiling and, in the process, generate tensions along a number of critical divides in the society—rural *versus* urban, agriculture *versus* industry, rural poor *versus* rural and urban elite. These tensions are difficult to manage and the groups implementing the reforms, often, do not even care to adopt economic policies supportive of reform objectives. Hence, the reforms with a capital R do not work to the blueprint with which they start and, as illustrated by the unfortunate case of Iran, can have an agonisingly frustrating outcome.

It occurs to us that it would be very relevant to have a theory which could correlate the features of a developing country with the kind of reforms it could achieve. In his elegant introduction, the editor reaches the cautious—almost pessimistic—assessment that the impact of reforms "while beneficial for growth, is likely to affect unfavourably the poorer beneficiaries of reform and lead to a renewed, *albeit* different, process of generation of inequalities. Although such a process need not necessarily generate poverty in all situations, in the context of the regions studied this seems a distinct possibility". But the overall perspective and mood of the book derive from what was described at the beginning of this review as the nostalgic view of agrarian reforms. Nostalgia is no crime but, for researchers, it could be a handicap in making a realistic assessment of what agrarian reforms can and cannot achieve in the developing countries. Interestingly, the elaborate analyses of reforms contained in the book offer few clues to what a realistic agenda for reforms might include given the socio-economic and political environments of the countries covered in the studies.

# State as Private Property

**Nita Sanghvi**

**Corruption as the 'Fifth' Factor of Production in the Sudan** by El-Wathig Kamier and Ibrahim Kursany; Research Report No 72 of the Scandinavian Institute of African Studies, Uppsala, 1985; pp 33.

THE ouster of President Jafar Nimeiri of Sudan in the first week of April 1985 put an end to a 16-year old government which had been riddled with serious economic problems. Sudan had been the recepient of the most American foreign aid in Africa (after Egypt)—receiving about $ 200 m annually in economic and military aid. In recent months, however, the aid was being withheld by the US government because of the failure of Sudan to put "certain economic changes" into effect. The external debt of $ 9 billion, drought, political repression and rampant corruption had alienated the civilian elite—doctors, lawyers, engineers and other middle class professionals—who successfully organised a general strike before overthrowing the government.

The stories of blatant and sordid corruption are reported to have embarrassed even the Sudanese, used to the corrupt practices of government officials. It is perhaps more than a coincidence that the Scandinavian Institute of African Studies published its 72nd research report in April 1985 which describes corruption as the fifth factor of production in Sudan. The number of millionaires in rural as well as urban areas was incredibly high for a country considered 'least developed' by the UN. Since their numbers had increased in less than two decades, the report states that in the Sudanese context, corruption could be considered as the fifth factor determining the production and, more importantly, the distribution of national product.

The forms of corruption documented in the report are not new to observers of developing countries: embezzlement of public funds through the banking industry, sale of state assets, sale of government lands, operations of government undertakings (in areas like mining, agriculture, trading) and smuggling. What is perhaps new is that the state had taken action against corruption—legal proceedings had started in 1975 in some 800 cases of which, by 1982, 51 cases had been concluded. On the basis of the evidence available from these cases, the report presents the class background of those who indulged in corruption and arrives at the conclusion that this "parasitic capitalist class" lacks a homogenous base. It is composed of high ranking officers, top civil servants, lawyers, managers, doctors and even academicians. Perhaps the very nature of the formal education system, which this class goes through, develops certain aspirations quite unrelated to the resources available in their society. These aspirations, sought to be fulfilled in financial terms on an individual basis, lead them to opt for quick-rewarding projects—mercantile rather than industrial—through a continuous use of the state apparatus, since the state is the axis for such activities. In such a situation proximity to political power replaces productive investment as the major source of income.

The report shows that the state farm at Habila was sold off under the 'New Schemes' programme to private owners who were related to senior officials in government. For example, the managing director of the Mechanised Farming Corporation and his deputy managed to provide four schemes for members of their own families. The list of other beneficiaries includes a regional minister for agriculture, a regional minister for finance, an army officer, an ex-commissioner, and a deputy speaker of a regional assembly.

The ownership of the Islamic Development Company, set up in 1983 for investment in agriculture, industry, housing, mineral exploration and banking, follows a similar pattern. Among its founder members, who owned shares valued over US $100,000, were the President and Vice-President of Sudan, the Minister of Finance and Economic Planning, the Director of Military Economic Corporation and some leading figures in Muslim Brothers movement.

Although corruption as a problem faced by most developing countries has been sought to be justified in a variety of ways by theorists like A M Hoogvelt and others who maintain that pelty corruption presents no threat to the democratic process since it allows the general public to manipulate some rules and regulations, thereby mitigating some of the stresses in the social system. To this extent corruption is an alternative to violence.

Developments in Sudan, however, disprove such theories which ignore other crucial dimensions of the problem. The continued existence of corruption as a mode of capital accumulation requires that the state is powerful enough to protect the material interests of the parasitic class. This repressive machinery pre-empts a large portion of the economic surplus that would otherwise be available for development projects. Secondly, the strengthening of the repressive machinery of the state results in further erosion of democratic processes. And when the size of the cake is no longer adequate for even the elite, a section of it revolts.

# Sundaram Finance Limited

Registered Office: 180 Mount Road
Madras-600 006

**Speech delivered by Shri T S Santhanam, Chairman, at the Thirty First Annual General Meeting of the Company held on 14th June, 1985, at Madras.**

I have great pleasure in welcoming you all to the 31st Annual General Meeting of your Company.

At the outset, may I request you to observe silence for a minute as a mark of respect to our late Prime Minister Smt Indira Gandhi.

The Directors' Report and the Audited Accounts for the year ended 31st December 1984 are with you, and with your permission, I shall take them as read.

## WORKING RESULTS

The payments against Hire Purchase documents made by the Company during the year were marginally lower at Rs. 45.17 crores as compared to Rs. 45.34 crores in the previous year. The stock-on-hire under Hire Purchase contracts as on 31st December, 1984 rose to Rs. 95.49 crores from Rs. 91.39 crores as at the end of the previous year. In the Equipment Leasing Division, the Company wrote leases amounting to Rs. 6.61 crores making a growth of about 50% over the previous year.

## DIVIDEND

Your Directors have recommended a final dividend of 12% which together with the interim dividend of 8% paid in January, 1985, makes a total of 20% for the year 1984.

## DEPOSITS

The net accretion to deposits in 1984, amounted to Rs. 12.53 crores. The Company reached the ceiling of Rs. 72.22 crores in October, 1984, when further acceptance was suspended. After the finalisation of the accounts for the year 1984, the Company resumed acceptance of deposits from last month. I am happy to inform you that the inflow of deposits is encouraging.

## GENERAL

Consequent to the increase in the prices of motor vehicles, spare parts, tyres and petroleum products, road transport operations have become economically unviable. The Government should seriously consider taking effective steps to make the road transport industry economically viable, since road transport is a vital infrastructure for economic development and has a high employment potential. The condition of existing roads has been steadily deteriorating due to poor maintenance. The expenditure on roads as a percentage of the total revenue from the Road Transport Industry has been steadily falling during the successive plan periods. I appeal to the Government to allocate sufficient funds for the laying of more roads, better surfacing of roads and the proper maintenance of roads. It is estimated that bad road conditions cost more than Rs. 500 crores a year by way of extra expenditure on fuel, besides considerable increase in expenditure on tyres and spare parts. It is essential that the Central and State Governments bestow serious attention on improving our road system to subserve the needs of our economy.

The reduction in Direct taxes effected by the Finance Act, 1985, is a welcome measure that will encourage greater internal generation of funds and will accelerate industrial growth. The proposed tax reform suggests a phased withdrawal of Investment Allowance. I would request the Finance Minister to consider retention of Investment Allowance to encourage modernisation and expansion of the industry.

The wide disparity in the rates of Sales-tax levied by several States has led to diversion of trade from one State to another. The State Governments should consider a ceiling on the rate of Sales-tax and narrow down disparities.

The 46th amendment of the Constitution has enabled the State Governments to levy Sales-tax on Hire Purchase and Leasing transactions. In the interests of capital formation in Industry, it would be necessary to treat Leasing transactions on par with Hire Purchase transactions. However, in case the Governments do not accept this proposition, they may consider charging Sales-tax only on the original purchase price of the equipment instead of on the total lease rentals paid.

## OUTLOOK FOR 1985

Hire Purchase business in the five months of this year has been higher than that of the corresponding period last year. However, there is stagnation in the purchase of medium and heavy duty commercial vehicles. The Company hopes to achieve a higher volume of business during the current year.

The Company's Order Book in the field of Equipment Leasing is satisfactory and the Company is hopeful of making reasonable progress under this portfolio.

The Governmental clearance for setting up a subsidiary Leasing Company in collaboration with the State Bank of India and the International Finance Corporation (Washington) has now been obtained and we are proceeding with the requisite formalities.

## ACKNOWLEDGEMENT

On behalf of the Board of Directors and on my own behalf, I take this opportunity to thank our customers, depositors, bankers and shareholders for the co-operation extended to and confidence reposed in the Company, and look forward to receiving their continued support. I also place on record my appreciation of the good work done by the staff both in the field and in the office.

This does not purport to be a record of the proceedings of the Annual General Meeting.

# Social History: Predicaments and Possibilities

**Sumit Sarkar**

*Research on modern Indian social history, here or abroad, cuts a sorry figure. A considerable gap remains between our understanding of the basic structures and tendencies of the colonial economy and the much-explored history of political movements in late colonial India. This area of silence relates to the vast and virtually unexplored terrain of forms of popular consciousness and culture. The gap is related to lack of fruitful dialogue between history, sociology and social anthropology.*

*The failure of grapple seriously with problems of consciousness and culture leads repeatedly to inadequate or even trite explanations, in particular the two related poles of economic reductionism and mobilisation by great leaders/ideologies or skilful manipulators of patron-client linkages.*

*There is need to move towards both 'a materialist and relational concept of culture' and 'a more culturally embedded analysis of the material world'. A social history developing through a fruitful, because critical, dialogue with anthropology can help "in locating new problems, in seeing old problems in new ways, in an emphasis upon norms and value systems and upon rituals, in attention to expressive functions of forms of riot and disturbance, and upon symbolic expressions of authority, control and hegemony".*

OVER the past generation, the focus of interest in modern Indian history has shifted decisively from viceregal policies, external relations and administrative developments towards an increasingly sophisticated economic history on the one hand, and studies of the national movement, now being broadened rapidly to include various forms of popular protest, on the other hand. But even a passing glimpse of current historiographical tendencies elsewhere brings a painful awareness of the relative poverty so far of researches on modern Indian social history.

In an influential article published in 1971, E J Hobsbawm noted that social history "as an academic specialisation" was "quite new", but commented on "the remarkably flourishing state of the field. It is a good moment to be a social historian. Even those of us who never set out to call ourselves by this name will not want to disclaim it today".[1] The growing importance, respectability, and even predominance, of the genre would be evident to any reader of the stimulating British historical periodicals of the 1970s and early 80s: *Past and Present, History Workshop* and *Social History* can claim pre-eminence here. The *Annales* of course had acted as the pioneer, while in the USA "social history has gradually come to supplant political history as the dominant concern of the academy."[2] It is symptomatic of changing historiographical moods or fashions that a volume published in 1982 in honour of E J Hobsbawm did not have a single article on specialised economic history, even though that had been his original field of expertise".[3]

The social history boom in the West has gone alongside of shifts in the meaning of that convenient but vague label. Already in 1971, Hobsbawm dismissed what he described as the "residual view of social history"—Trevelyan's "history with the politics left out"—as something requiring "no comment". He distinguished two other earlier connotations—lower class, labour or peasant protest, conventionally often labelled as "social movements", and the social as (an usually secondary) adjunct of the economic—till the growth of a specialised, quantitative, 'hard', economic history enforced a rupture between cliometricians and lesser folk. The real burden of Hobsbawm's paper, however, had been a call to broaden "social history" into "the history of society". The debt here to Marc Bloch and Lucien Febvre's programme for 'integral', 'global' or 'total' history was obvious and acknowledged. The two leading features of the recent boom in social history have been in fact a tremendous broadening in the scope of historical research to cover multifarious aspects of the lived experience of the past, bringing within its scope numerous dimensions and themes left only yesterday to antiquarians, folklorists and anthropologists, and an openness towards the concepts and methods of other social sciences. Among these, social anthropology today can claim something like a primacy so far as the current debts of historians are concerned.[4] The shifts have been extensive and rapid, so that even an article like Keith Thomas 'History and Anthropology' published in 1963, conveys a curiously dated flavour today: anthropology then was still being identified by this British historian with structural functionalism with no reference at all to Levi-Strauss or structural linguistics, and education, family and the history of mentalities were described as subjects hardly explored so far in Britain.

The expansion, as one would expect, has been not without tensions, debates, and sharp antinomies, some of which I intend to touch upon and try to relate to our own historiographical problems a little later. For the moment it might be convenient to remind ourselves that 'total' history has been used in a number of different senses, not all of them of equal potential value, relevance or practicality in the context of existing source material and resources in India. It can imply efforts to define entire epochs and/or their succession over time: civilisations, 'traditional' as distinct from 'modernising' societies (a sociological-cum-political scientist vogue now happily somewhat in decline), modes of production and social formations. The latter, Marxian tradition, despite repeated vulgarisations to an almost equivalent extent by believers and traducers alike, has retained a coherence and heuristic power unequalled by its rivals. Fruitful when related imaginatively and effectively to specific empirical contexts, such a conception of totality can degenerate into scholastic labelling exercises in lesser hands. The most effective Marxist interventions in academic history-writing have usually been at a somewhat lower level of abstraction and ambition. We may admire (with qualification) Perry Anderson, but would have been really impoverished without Thompson, Hill, Hilton or Hobsbawm.

With the partial exception of Marc Bloch's "Feudal Society",[6] the bulk of the classic work of the *Annales* school operated with a somewhat different concept of *l'histoire integrale*: the study of a region over the *longue duree*, hopefully 'total' in scope, proceeding systematically through the various 'times', 'geographical', 'social', and 'individual' relevant for the historian.[7] Braudel on the Mediterranean, and LeRoy Ladurie on Languedoc have been the two outstanding exemplars of this mode of history-writing, which became associated for a time in the 1950s and 60s with a denigration of political, narrative or episodic (*evenementielle*) history. Event, agency, and process tended to be marginalised in the quest for long-term structures, ecological and demographic, and Ladurie even talked of a 'history that stands still' till the 18th-19th century break, coming surprisingly and perilously close to modernisation theorists.[8] It may be doubted whether such works have really been as 'total' as they had set out to be[9] and in any case we sadly lack in India the necessary infrastructure of "a prodigious body of articles, papers, books, publications, surveys, some purely historical, others no less interesting, written by specialists in neighbouring disciplines" which Braudel used to write about "the Mediterranean and the lands illumined by its glow".[10]

It is 'total' history in a third sense, however, which I feel might prove the most fruitful and realisable in the Indian context: focused on a fairly well-defined theme, problem, or even the once-abused 'event' or 'episode', but trying to study it in depth, and looking at its various dimensions. Many of the more recent works in the *Annales* tradition have themselves moved in this direction, including Ladurie's two best-sellers, "Montaillou" and "Carnival at Romans". The currently very fashionable history of *mentalite* still often seeks the *longue duree*, but chooses for intensive study one aspect of human sensibility in its bid to explore the "ideas concerning childhood, sexuality, family and death ... the attitudes of ordinary people towards everyday life ...".[11] It thus seeks to implement a programme outlined by Lucien Febvre more than a generation back.[12] Independent of each other, contemporary feminism and new techniques of demographic research have led to a vast and extremely fruitful expansion of the field of family history and women's studies in Western Europe and America: once again anthropology has become a major influence here.[13] The partial rehabilitation of *l'histoire evenementielle*—what Lawrence Stone recently described as the "revival of narrative"[14] has had as one of its significant consequences a new mode of writing political history, no longer an outcaste from total history but transformed into a "history in depth by becoming the history of power", with a new focus on the "semiology of power", investigating signs, symbols, and a variety of non-written documentation.[15] A study of ruling groups, of changing patterns and symbols of domination, or even of diplomacy, it needs to be emphasised, can be as genuine and valuable a work of social history as research on popular movements or popular culture. The identification of lower-class protest as 'social', as distinguished from the history of elites to which the term 'political' has to be confined, is an unfortunately deep-seated historical habit which is unhelpful and indeed illogical.[16] 'Social history' cannot really have a separate domain, marked off from 'economic' or 'political'; the differentia must consist in approach and methods, not necessarily subject matter.

In the hands of the best practitioners of social history today, practically any event or aspect of past experience can be made to yield far-reaching insights. The testimony before the Inquisition of a totally obscure 16th century Italian miller, rituals and festivals of inversion, the French *Charivari* and the English 'rough music', serve as starting points for fascinating reconstructions of the world of popular culture.[17] Food riots become indicators of a partially autonomous 'moral economy' of the crowd.[18] The 'black act' of 1723 and studies of crime and law provide pivots for a major reconstruction of 18th century English history which turns Namierism on its head.[19] The diaries of A J Munby and Hannah Cullwick, minor Victorian poet and his servant-cum-mistress, illuminate intricate nuances of gender and class relations.[20] The prints of Hogarth, or New Year festivities in remote Newfoundland villages, lead on to major theoretical discussions of concepts of culture and class.[21]

## II

Research on modern Indian social history, here or abroad, cuts a rather sorry figure if set besides such abundance. Recently an applicant for a college job in Delhi, asked to name a single good general work on the social history of modern India, replied that there is no such book. The selection committee, I am told, was dissatisfied with the answer: as sometimes happens, here the experts were wrong and the candidate right. The 'residual' approach, dismissed so cavalierly by Hobsbawm, still flourishes among us. A survey of 18th century social life published in 1976 hailed G M Trevelyan's "Social History" as a "brilliant example", and went on to give scattered details about religious sects, education, caste, family life, the position of women, and various "social evils" before embarking on a more congenial summary of economic conditions.[22] For the 19th century, there has often been a more surprising, indeed possibly unique, redefinition: social history is tacitly equated with the history of 'social reform' initiated by and confined overwhelmingly to educated 'middle class' groups, set against the background of British educational and 'social' policies. Thus V A Narain's "Social History of Modern India" (1972) deals successively with Company "social policy", missionaries and "humanitarianism" and English education, followed by nine chapters on social reform movements.[23] R C Majumdar's "History of Modern Bengal" (1978) seems to promise a little more, with its long chapters on Religion and Society based on extracts from contemporary journals collected by Benoy Ghosh. The absence of any theoretical framework, however, leaves us in the end with bits and pieces of scattered information.[24] The most eminent of historians thus seem curiously uncertain in the domain of social history when they venture out of the safe confines of *sati*, widow-remarriage, Brahmoism or 'Hindu revival'. Similar assumptions, confusing a not-unimportant but undeniably limited sector with a potentially vast field, underlie many University syllabi on 'social history'—including that of my own, though fortunately this has been ignored in practice and is now under revision.

Prospects appear somewhat brighter as regards the two other sub-types of traditional social history distinguished by Hobsbawm: the social as an adjunct of the economic, and studies of popular protest. A number of historians have tried to work outwards from analysis of economic structures of particular regions to changing social and political relationships: Ravinder Kumar's study of Western India and some of the articles in his recently-published "Essays on the Social History of Modern India" can serve as good examples of this genre.[25] Numerous and varied attempts have been made to relate nationalism to its social and economic 'basis': educated 'middle class' grievances, bourgeois upthrust, elite competition, material interests of local patron-client networks, the contrasting implications of wet and dry farming and the emergence in certain areas of rich peasant groups.[26] In recent years there has also been a notable effort to develop a distinct sub-discipline of urban history.[27] And 'history from below' flourishes today, with a large number of publications or research in progress on protest movements of tribals, peasants, and (to a lesser extent) industrial workers.[28] Attempts at 'total' histories of whole regions over longish time-spans remain inhibited by inadequate source materials and lack of a necessary infrastructure of micro-studies, but a

# Crop Insurance in India
## A Review, 1976-77 to 1984-85

**V M Dandekar**

*In 1979-80 the General Insurance Corporation, in collaboration with the state governments, introduced a crop insurance scheme in 26 areas of Gujarat, 23 areas of West Bengal, and 17 areas of Tamil Nadu. Since then, the scheme has been extended to more areas of more states. The purpose of this paper is to trace the methodological modifications made from time to time in the original scheme, to identify certain outstanding problems and to suggest provisional solutions.*

AT the instance of the General Insurance Corporation of India, the Indian School of Political Economy prepared a report on the feasibility of introducing crop insurance in India. The report was submitted to the GIC in May 1976 and subsequently published in *Economic and Political Weekly*, Review of Agriculture, June 26, 1976. In 1979-80 the GIC, in collaboration with the state governments, introduced a crop insurance scheme in 26 areas of Gujarat, 23 areas of West Bengal, and 17 areas of Tamil Nadu. Since then, the scheme has been extended to more areas of more states. In Appendix A is given year by year progress of the scheme. The purpose of this review is to trace the methodological modifications made from time to time in the original scheme, identify certain outstanding problems and suggest provisional solutions.

It will be useful to begin with a summary of the original scheme proposed in the report mentioned above. We quote from the last section of the report, titled Summary and Recommendations:

> Though the Individual Approach to crop insurance, in which the assessment of the indemnity is done separately for each individual and is based on the actual crop-output of the concerned farmer each year compared to his normal output, would be the most appropriate and in a sense an ideal approach to the crop insurance, any scheme based on this approach proves impracticable because the process of assessing the indemnity separately for each individual is administratively expensive, liable to interminable dispute and frought with grave dangers of moral hazard.
>
> The alternative to an insurance scheme based on the Individual Approach is an insurance scheme in which the assessment of indemnity is not done separately for each insured farmer but is done together for all farmers in a given area. The indemnity paid is determined by comparing each year the actual average crop-outturn over the whole area with the normal crop-outturn of the area. Thus the crop-output of any individual farmer does not enter into the assessment of indemnity. All farmers are paid indemnity at the same uniform rate and it is based on the year-to-year fluctuations of the average crop-output over the whole area. We may distinguish this approach from the Individual Approach and call it the Area Approach.
>
> The Area Approach obviates the main difficulties of the Individual Approach. It does not require ascertaining the crop-outputs of individual farmers. All that it needs is estimates of average annual yields of the crop over the whole area. These can be ascertained objectively from the crop-cutting experiments conducted by the state governments for purposes of crop estimation. Being objectively determined, they are much less open to dispute and much less liable to moral hazard.
>
> From the standpoint of a farmer, for the scheme to serve the purpose of crop insurance, the years when the average output of the area is below the normal should also be years when his own crop-output is below his own normal and *vice versa*. If the area is small enough and is agro-climatically homogeneous, the crop-outputs of a majority of farmers therein would be highly correlated, that is to say, they would move together above or below their respective normals. In such a case, they would also move together with the average crop-output of the area and hence the scheme would be meaningful as a crop insurance scheme. For this reason, it is suggested that, in a crop insurance scheme based on the Area Approach, the area in which all farmers would pay the premium at the same rate and would receive indemnity at the same rate should be a homogeneous area.
>
> For this purpose all that is needed is delineation of agro-climatic regions small enough to be homogeneous, in the sense that the annual crop experience of a majority of the farmers in the area accords and coincides with the average experience of the area, and large enough to have an adequate data-base of annual crop-cutting experiments to enable the determination of the normal yields and estimation of annual average yields with reasonably small statistical error.
>
> The principal actuarial aspect of a crop insurance scheme is the year-to-year variation in crop yields. This, together with the terms and conditions on which indemnity becomes payable, determines the rate of premium. Larger the year-to-year variation, higher is the premium rate for a given level of indemnity. Similarly, for a given level of year-to-year variation, higher has to be the premium for a more liberal indemnity.
>
> In crop insurance based on the Area Approach, there is no advantage in having a separate crop insurance scheme for each specific crop. On the other hand, there is distinct advantage in having a crop insurance scheme for all major crops of the area taken together. From the standpoint of the farmer such a scheme is more relevant. Administratively, it is greatly simpler. Most of all, because the coefficient of variation of the overall productivity of all crops taken together is much smaller than the yield variability of individual crops, it will be possible, in general, either to reduce the rate of premium or offer more liberal indemnity; it means that it will be possible to prepare a feasible and worthwhile crop insurance scheme for practically all areas of the country.
>
> Collection of premium regularly on a voluntary basis is not feasible and hence an element of compulsion seems necessary. Making crop insurance compulsory for all farmers of an area will also not make collection of premium easy. Hence, it is suggested that crop insurance may be linked to short-term agricultural credit. The crop insurance scheme thus becomes a crop-loan insurance scheme. All loans should be compulsorily insured. Premium should be deducted from the loan advance. Indemnities should be adjusted against recovery. Thus integrated with agricultural credit, the crop insurance will involve hardly any additional administration costs.
>
> The linking of crop insurance to crop loans is suggested not merely as an expediency. The entire agricultural credit structure is in urgent need of protection from the hazards of agriculture and this can be done only by means of an appropriate crop insurance scheme suitably linked to the agricultural credit structure.
>
> From the actuarial standpoint, in a crop insurance scheme based on the Area Approach, the unit of insurance is a homogeneous area and not an individual farmer. Therefore, for purposes of a desirable horizontal spread of risk, it is necessary to begin with a large number of homogeneous areas. Hence, it seems necessary and desirable to begin with a large number of homogeneous areas and with all crops in the

areas taken together. Phasing is desirable to gather and learn from experience. For that purpose, it will be appropriate to make a beginning with small farmers, defined by their total credit eligibility, and gradually extend the scheme to all farmers.

We have so far proceeded on the assumption that the crop loan insurance scheme would be self-supporting, except for the costs of administration which we have kept to the minimum, in all areas and for all categories of cultivators. This should be so as far as possible. But there are legitimate grounds for a certain amount of subsidy which need not be ruled out. The following may be considered in due course:

(i) Areas with comparatively secure agriculture, that is areas with relatively low coefficient of variation, may be charged slightly higher, but only slightly higher, premium than warranted and the same may be used to subsidise lower than warranted premium in areas with high coefficient of variation.

(ii) Areas with high coefficient of variation may be directly subsidised. If there is a choice between subsidising a lower rate of interest and a lower rate of premium, the latter is important for areas with highly insecure agriculture.

(iii) Small and marginal farmers may be charged a lower rate of premium by direct subsidy. Here again, if there is a choice of subsidising a lower rate of interest and a lower rate of premium, the case for the latter is stronger.

The GIC accepted the above scheme with certain modifications. The Area Approach was accepted but the stipulation that for each area there should be a single scheme for all crops taken together (on the basis of a composite index of agricultural production) was not accepted. Instead it was decided to have separate schemes for different crops. This was done on the ground that a composite scheme for all crops together may not be intelligible to the farmers.

| 1975-76 | 1265.86 | 1133.69 | 2506.36 | 2064.19 |
| Total | 9880.52 | 10709.21 | 18645.29 | 19788.71 |

*Note:* For 1972-73, data was not available for a number of areas.

The stipulation that, in order to spread the risk horizontally, the scheme should be extended to as many areas as possible was not accepted or was not followed. Instead, the scheme was introduced on a so-called 'Pilot' basis in a few blocks of a few districts in the states where the state governments were willing. In consequence, though by 1983-84, the scheme was accepted by 12 state governments, it remained confined to only about 600 blocks in the country.

The suggestion that the crop insurance scheme should be linked to the short-term agricultural credit was accepted. But the stipulation that it should be made compulsory for all borrowing members was not accepted; probably because it would not be politically acceptable or because of the fear that it would involve the GIC into very large liability. The suggestion that, while the scheme was extended to as many areas as possible and made compulsory to all borrowing members, in order to keep the total liability within given limits, the scheme should be applied in the first instance to small farmers defined by their credit eligibility, was also not accepted. The scheme was applied to a few selected areas and was offered to all borrowing members but on a voluntary basis. In consequence, even in 1983-84, the scheme covered only about 60,000 farmers all over the country. The scheme is thus not as yet fully integrated with agricultural credit.

With these modifications, the GIC accepted the scheme as originally proposed and entrusted the technical work of pre-

paring the Premium Tables to the Indian School of Political Economy. The ISPE has been doing this work for the past eight years (1977-1984). Over the years, the methodology has undergone certain important changes. As the main purpose of this review is to trace these changes, it will be useful to explain briefly the methodology envisaged in the original report and adopted in the beginning.

From the standpoint of a farmer, the main elements of a crop insurance scheme are the the following: (i) Suppose the farmer has a crop loan of Rs 1,000. This sum is insured. It is called the 'sum assured'. (ii) To ensure this amount, the farmer pays a certain amount each year. This is called the 'premium' and is expressed as a percentage of the 'sum assured'. (iii) As a benefit of insurance, in a year of crop failure, the farmer is paid a certain amount called the 'indemnity' which again is expressed as a percentage of the 'sum assured'. (iv) In the Area Approach, the fact of a crop failure is judged by comparing the average yield of the crop in the current year with its average over the past few years which we had initially suggested should be ten years; thus supposing the ten-year average yield of a certain crop in a given area is 800 kg, an indemnity would become payable if the current average yield is below 800 kg. (v) This is somewhat qualified by the rule that a shortfall upto a prescribed limit is not considered indemnifiable; this limit is called the 'non-indemnifiable limit' which we shall denote by NIL. Suppose it is 10 per cent. In the present case, it means that unless the current yield is less than 720 kg, no indemnity is payable. Hence, in a sense, 720 kg, which is 90 per cent of 800 kg being the ten-year average yield, is the 'guaranteed yield'. We shall refer to it as the 'guaranteed yield'. If we denote the ten-year average yield by M, the guaranteed yield is given by G = M(1–NIL/100). Only when the current yield is below the 'guaranteed yield', an indemnity becomes payable. (vi) The amount of indemnity as percentage of the 'sum assured' is determined as follows: Suppose the current yield is 640 kg. Then the indemnity payable is

$$\frac{(720-640) \times 100}{800} = 10 \text{ per cent}$$

of sum assured. More generally,

$$\text{Indemnity} = \frac{(G-y) \times 100}{M}$$

per cent of the 'sum assured'; where M is the ten-year average, G is the guaranteed yield, and y is the current yield. In other words, in a given year, if the actual yield y is less than the guaranteed yield G, we express the shortfall as percentage of the ten-year average M; this percentage of the 'sum assured' is the 'indemnity payable'.

In about half or more years, the actual yield is not likely to be below the 'guaranteed yield' so that no indemnity is payable. In other years, the indemnity payable varies from year-to-year depending upon the actual yield that year, small

| 12 | West Bengal | 1973-83 | 409.58 | 425.00 | 2 | 146.34 | 196.50 | 3 | 10853.27 | 12590.50 | 2 |
| | | | 29005.54 | 29904.25 | 27 | 74873.09 | 82756.75 | 30 | 184182.32 | 196689.75 | 35 |

in some years, large in other years. On the other hand, the premium as a percentage of the 'sum assured' which the farmer is called upon to pay, remains, in principle, the same from year-to-year. Hence, in some years, the premium may exceed the indemnity payable while in others the premium will be less then the indemnity payable. For an insurance scheme to run on a no-profit-no-loss basis, the total premium receivable must be equal to the total indemnity payable over a long period. The principal statistical problem arises from the fact that just ten observations, such as the ten annual yields, do not provide an adequate statistical basis for estimating the total indemnity which may become payable over a long period. Annual yield data over a longer period are usually not available. Even if they were available, it would not be desirable to use them because substantial changes in annual yields might have occurred over such a long period. Hence, it becomes necessary to pool the annual yield data for a number of crops in a number of areas in order to obtain adequate statistical base for estimating the indemnities which may become payable over a long period and therefrom to derive the annual premium which must be charged.

Data was received from several states regarding annual average yields of different crops in different areas (districts/tehsils/blocks/strata). Henceforward, we shall refer to a given crop in a given area as a 'case'. Thus, each case gave ten observations or data points, namely, the annual average yields for ten years. In order to create the necessary statistical data base, we had the alternative of pooling either (a) all cases of the same crop in all areas in each state, or (b) all cases of all crops (in each state) with year-to-year variability falling within a small range. We choose (b) because presumably that would give more homogeneous groups of cases which may be pooled. Hence, the following procedure was adopted:

(i) For each case were computed the ten-year average M, the standard deviation SD, the SD expressed as percentage of M called the coefficient of variation CV. The CV was taken as an index of year-to-year variability and all cases in each state were classified into 20 groups according to the value of CV as follows:

(1) CV not more than 10;
(2) CV more than 10 but not more than 15; etc;
(19) CV more than 95 but not more than 100; and finally
(20) CV more than 100.

We shall refer to these groups as the CV groups. All cases in each CV group were pooled together. The following procedure was followed for each CV group separately.

(ii) In each case, we have annual yields normally for a period of ten years; in other words, in each case, we have 10 observations. Hence, the total number of observations or data points in a CV group is generally 10 times the number of cases in the group; if there are 20 cases, the number of observations is generally 200. But sometimes a case is not complete; that is, it does not provide annual yields for ten years. In the interest of making full use of available data, one has to admit such cases with less than 10 years' yields, say with only 9 or even 8 years' yields. In such cases, the number of observations or data points in the group is determined by counting the annual yields in the cases being pooled. We shall denote by N the number of observations or data points so counted.

(iii) Before pooling the annual yield data in all the cases in a CV group, they are standardised. Thus, if y is the annual yield, M the ten-year average, SD the standard deviation

$$z = (y-M)/SD$$

gives the annual yield in the standardised form. If z is positive, it means that the yield in the particular year is above the ten-year average. If z is negative, it means that the annual yield in the particular year is below the ten-year average; in fact, negative z gives the shortfall from the ten-year average divided by the standard deviation, that is expressed in units of standard deviation. For further work, we need only the negative z values.

(iv) Arrange all the negative z values in descending order of their absolute values; that is, bring the largest shortfall at the top and the smallest shortfall at the bottom. Number all the observations serially. We shall call these serial numbers n. Hence, the n corresponding to a given z value gives the number of times that is how often a shortfall as large as or larger than the given z occurs.

(v) Cumulate the z values from the top. We shall denote the cumulative series by Z. Then the Z corresponding to a given z value gives the sum-total of all shortfalls as large as or larger than z.

TABLE 5: FREQUENCY (PER CENT) OF YEARS SHOWING EXCESS OF CUMULATED PREMIA OVER CUMULATED INDEMNITIES IN A 1000 YEARS' SERIES CONSTRUCTED BY RANDOMISING PREVIOUS TEN YEARS EXPERIENCE

| Sr No | State | Negative | Upto 5 Per Cent | 5-10 Per Cent | More than 10 Per Cent |
|---|---|---|---|---|---|
| 1 | Andhra Pradesh | 3.80 | 50.20 | 46.00 | 0.00 |
| 2 | Assam | 0.00 | 0.00 | 2.20 | 97.80 |
| 3 | Gujarat | 19.80 | 67.60 | 2.90 | 9.70 |
| 4 | Haryana | 0.50 | 6.40 | 89.00 | 4.10 |
| 5 | Himachal Pradesh | 0.30 | 27.20 | 64.80 | 7.70 |
| 6 | Karnataka | 0.10 | 0.80 | 55.80 | 43.30 |

| 9 | Orissa | 2.90 | 65.90 | 11.60 | 19.60 |
| 10 | Tamil Nadu | 0.30 | 0.10 | 1.50 | 98.10 |
| 11 | Uttar Pradesh | 15.50 | 8.70 | 45.70 | 30.10 |
| 12 | West Bengal | 0.20 | 1.20 | 67.40 | 31.20 |
| 13 | Average | 3.61 | 22.74 | 34.61 | 39.04 |
| 14 | For 12 states together | — | — | 47.25 | 52.75 |

TABLE 6: CLASSIFICATION OF CASES BY RATIO OF RATE OF ANNUAL CHANGE (b) TO 10-YEAR AVERAGE (M)

| (b/M) × 100 | Kharif Rice | Other Rice | Wheat | Millets and Gram | Other Crops | Total |
|---|---|---|---|---|---|---|
| 5 + | 296 | 147 | 163 | 160 | 190 | 956 |
| 4-5 | 111 | 52 | 64 | 36 | 43 | 306 |
| 3-4 | 127 | 64 | 52 | 47 | 45 | 335 |
| 2-3 | 152 | 80 | 36 | 51 | 37 | 356 |
| 1-2 | 157 | 89 | 29 | 43 | 36 | 354 |
| 0-1 | 133 | 66 | 17 | 55 | 26 | 297 |
| Negative | 392 | 221 | 30 | 212 | 231 | 1086 |
|  | 1368 | 719 | 391 | 604 | 608 | 3690 |

(vi) Both z and Z are expressed in units of standard deviation SD. To express them as percentage of the ten-year average M, we should multiply them by the $CV = (SD/M) \times 100$. But the CV for all cases in a CV group is not the same; it lies within a range such as say 10 to 15 per cent. Hence, as an approximation, we take the mid-value of the CV range, 12.5 in the present case, as the average CV for the group. We shall denote this by mCV. Hence, if we multiply z and Z by mCV, we convert them to percentages of the ten-year average yield. Thus, ZmCV gives the sum-total of all shortfalls as large as or larger than zmCV both expressed as percentages of the ten-year average yield.

(vii) zmCV and ZmCV are both expressed as percentages of the ten-year average and both are measured from the average. Hence, if we add 100 to each, we measure both from zero. Further, noting that z and hence Z are both negative quantities, after adding 100 to zmCV and ZmCV, we may write them as $(100 - zmCV)$ and $(100 - ZmCV)$. The first gives a certain yield expressed as percentage of the ten-year average yield. The second gives the sum-total of all yields smaller than the given yield.

(viii) It may be readily seen that $(100 - zmCV)$ is the 'guaranteed yield' corresponding to the non-indemnifiable limit zmCV both expressed as percentages of the ten-year average. We need the sum-total of the shortfall of yields smaller than the 'guaranteed yield' measured from the 'guaranteed yield'. This is given by

$$(100 - ZmCV) - n(100 - zmCV)$$

where n is the frequency with which yields equal to or smaller than the 'guaranteed yield' occur. This may be written as

$$mCV(Z - nz)$$

and it gives the sum-total of the shortfall of all yields smaller than the 'guaranteed yield' measured from the 'guaranteed yield'.

(ix) The above gives the sum-total of the shortfall in the total experience (number of cases × years) pooled in the given CV group; in other words, in the number of observations or data points pooled in the CV group. This number is N. Hence,

$$mCV(Z - nz)/N$$

gives the average that is per annum shortfall from the 'guaranteed yield' expressed as percentage of the ten-year average.

(x) Thus, $mCV(Z - nz)/N$ gives the average indemnity payable per year expressed as percentage of the 'sum assured'. For the scheme to run on a no-profit-no-loss basis, the annual premium expressed as percentage of the 'sum assured' must be equal to this. Hence, we write

$$\text{Premium} = mCV(Z - nz)/N$$

(xi) Thus corresponding to each non-indemnifiable limit there is a premium. In general, larger the NIL, smaller is the premium. Hence a choice is to be made. The principle adopted was to let the NIL be within 10-50 per cent and let the premium not exceed 5 per cent. However, in many cases with large CV, even with NIL 40 per cent, the premium would exceed 5 per cent. It was presumed that these cases were not practicable without a substantial subsidy.

(xii) Fresh Premium Tables are prepared every year with changed data because the earliest year has to be dropped and latest year added. While making the choice of NIL and premium for the new Table, usually the principle is to keep the premium unchanged, as far as possible, from the previous year.

Premium Tables were prepared along these lines for several crops in several areas for 14 states during 1976-77, 1977-78 and 1978-79. These proved to be only practice runs because the scheme actually came into operation only in 1979-80. Before preparing the Premium Tables for 1979-80, two minor methodological modifications were made in the procedure. They are as under:

(a) The first modification was that the standard deviation SD was replaced by the mean deviation from the mean called MD and this expressed as percentage of M was called coefficient of mean deviation and denoted by CMD. This replaced CV. The reason was as follows: As was noted in the original report, the annual yields of crops do not appear to be distributed in the normal distribution. Under the circumstance, the standard deviation SD, as a measure of variability, has no particular merit. On the other hand, the mean deviation, besides being computationally simpler, falls in line with other calculations needed for determining the premium. For instance, the mean deviation MD is twice the average shortfall of the annual yields from the ten-year average and the coefficient of mean deviation CMD is twice the premium corresponding the zero NIL. Hence it was presumed that the classification of the cases by the CMD rather than the CV would produce groups more homogeneous for purposes of Premium Tables.

TABLE 7: CLASSIFICATION OF CASES BY RATIO OF CRMD TO CMD

| $\frac{CRMD}{CMD} \times 100$ | Kharif Rice | Other Rice | Wheat | Millets and Gram | Other Crops | Total |
|---|---|---|---|---|---|---|
| 100 + | 336 | 190 | 46 | 147 | 174 | 893 |
| 90-100 | 566 | 290 | 82 | 269 | 239 | 1446 |
| 80-90 | 232 | 94 | 68 | 105 | 108 | 607 |
| 70-80 | 133 | 67 | 54 | 48 | 41 | 343 |
| 60-70 | 57 | 45 | 41 | 16 | 25 | 184 |
| 50-60 | 29 | 21 | 46 | 14 | 14 | 124 |
| Less than 50. | 15 | 12 | 54 | 5 | 7 | 93 |
|  | 1368 | 719 | 391 | 604 | 608 | 3790 |

(b) In the procedure so far adopted, the indemnity payable in a year bears to the 'sum assured' the same ratio as the shortfall from the guaranteed yield bears to the ten-year average yield. In the illustration it was given by $(720\text{-}640)/800 = 10$ per cent of the 'sum assured' where 800 kg is the ten-year average yield, 720 kg is the guaranteed yield and 640 kg is the current yield. It was suggested by the GIC that the shortfall from the guaranteed yield should be expressed as percentage of the guaranteed yield rather than of the ten-year average yield. In the present case, it would be $(720\text{-}640)/720 = 11.1$ per cent, and hence the indemnity payable would be 11.1 per cent of the 'sum assured'. This would need corresponding modification in the formula for the premium. As given in (x) above,

$$\text{Premium} = \frac{mCV(Z-nz)}{N}$$

the premium is equal to the average annual shortfall from the guaranteed yield expressed as percentage of the ten-year average yield. Now, premium must be equal to the average annual shortfall from the guaranteed yield expressed as percentage of the guaranteed yield. The guaranteed yield as percentage of the ten-year average yield is given by $(1 - NIL/100)$. Hence the revised formula for the premium is given by

$$\text{Premium} = \frac{mCMD\ (Z-nz)}{N\ (1-NIL/100)}$$

where it will be noted that we have also replaced CV in the earlier formula by CMD as explained in (a) above.

The Premium Tables for the year 1979-80 were prepared, by the revised procedure, for several crops and areas of 14 states for which relevant data was received.

In that year a Pilot Crop Insurance Scheme was implemented for the first time in 26 areas of Gujarat, 23 areas of West Bengal, and 17 areas of Tamil Nadu. In April 1980, the GIC requested us to "undertake statistical exercises in respect of the 14 states to furnish us with details of indemnities payable and premia receivable during the past 10 years as if the Pilot Crop Insurance Scheme was implemented during the period". The exercise was done on the assumption that the Pilot Crop Insurance Scheme was implemented in the 14 states in all the areas of each crop for which Premium Tables were prepared. The 'sum assured' in each case was assumed to be Rs 100. The GIC also desired that the results should be furnished separately (a) considering cases with premium of five per cent or less, and (b) considering all cases. The results of the exercise were submitted to the GIC during April-December 1980. As typical, we give in Table 1 the results for Andhra Pradesh.

The amount of indemnity payable naturally varies from year to year. It will be noticed that in four out of the 10 years, the amount of indemnity payable exceeds the amount of premia receivable. For the ten years together, the total amount of premia receivable exceeds the total amount of indemnities payable by 8.4 per cent in cases of premium of five per cent and less and by 6.1 per cent in all cases together. This excess was deliberately provided for administrative expenses; in fact, on the advice from the GIC, 0.3 per cent was added on this account to the premia arrived at by the computational procedure outlined above. This constituted a higher proportion in the cases with lower premia than in all cases taken together. Finally, we may note that there is no other essential difference between cases with premium of five per cent or less and all cases. This is to be expected because the non-indemnifiable limits and premia are determined by identical procedure in all cases.

In Table 2, we give an all-India summary of the results. For each of the 14 states are shown the total amounts of indemnities payable and premia receivable during the period of ten years. In each case is also shown the number of years out of 10, when the amount of indemnities exceeded the premia. It will be noticed that, at the all-India level, out of 14 × 10 = 140 years of experience, in about one-third years (46 – 49) the indemnities would exceed the premia. In the totality, the excess of premia over indemnities is about eight per cent in cases of premia of five per cent or less and about five per cent in all cases together. This is due to the extra charge of 0.3 per cent added for administrative expenses which would bear a higher ratio in cases of lower premia than in all cases taken together.

The Premium Tables for 1980-81 were prepared following the same procedure as adopted for 1979-80. As mentioned earlier, in this procedure, all crops in all areas of a state were put together and classified by their CMD and a common set of Premium Tables was prepared for all cases in each CMD group. This was not entirely satisfactory. There were three reasons. First, the nature of the year-to-year variability of different crops could be very different and some of the differences would not be eliminated by our standardising procedure. Hence, as a first step, while preparing Premium Tables for 1981-82, crops were sorted out into those grown during kharif and during rabi seasons and separate sets of Preimum Tables for kharif and rabi crops were prepared using the same procedure as above.

The second reason arose out of the fact that the Pilot Crop Insurance Scheme was applied to only a few crops in a few areas of each state. While preparing the Premium Tables on the basis of all crops in all areas of a state pooled together, the expectation was that the scheme would be introduced for all the crops and for all the areas for which the Premium Tables were prepared. But, because of the rather unscientific notion of a 'pilot scheme' in this context pursued by the GIC and the state governments, the scheme was applied only to a few crops in a few selected areas. The possibility of adverse selection could not therefore be ruled out. The third reason was administrative. Because the procedure adopted needed crop yields of all the crops in all the areas of a state, all the data had to be received from the state governments before the work on Premium Tables could begin. Experience showed that, in spite of much effort, the receipt of crop yield data was not timely. Hence, either the preparation of the Premium Tables was held up or it had to be done on the basis of whatever yield data was received. Both alternatives were of course unsatisfactory. Hence, it was decided to prepare Premium Tables for each crop considered separately. It was also decided to prepare separate tables for the kharif, rabi, and summer varieties of a crop when such were present.

TABLE 8: TOTAL INDEMNITIES PAYABLE AND PREMIUM RECEIVABLE OVER A 7-YEAR PERIOD ON THE BASIS OF NEW FORMULA FOR CASES CLASSIFIED BY RATIO OF RATE OF ANNUAL INCREASE TO 10-YEAR AVERAGE

| (b/M) × 100 | Kharif Rice | Other Rice | Wheat | Millets and Gram | Other Crops | Total |
|---|---|---|---|---|---|---|
| | | | **Indemnity Payable** | | | |
| Negative | 19121.02 | 8348.89 | 1791.52 | 15844.80 | 18161.38 | 63267.61 |
| 5 and less | 20058.42 | 7545.91 | 4373.99 | 10202.56 | 8478.80 | 50659.68 |
| Above 5 | 9091.26 | 1940.30 | 3065.23 | 4861.88 | 7658.88 | 26617.55 |
| Total | 48270.70 | 17835.10 | 9230.74 | 30909.24 | 34299.06 | 140544.84 |
| | | | **Premium Receivable** | | | |
| Negative | 13080.25 | 4542.50 | 1875.75 | 10769.50 | 13435.00 | 43703.00 |
| 5 and less | 19006.50 | 6856.75 | 5642.00 | 10411.85 | 10070.25 | 51987.35 |
| Above 5 | 10779.25 | 3450.25 | 6091.75 | 7750.75 | 13172.75 | 41244.75 |
| Total | 42866.00 | 14849.50 | 13609.50 | 28932.10 | 36678.00 | 136935.10 |

The main problem of course was that if Premium Tables were to be prepared for each crop considered separately, the number of cases falling within a CMD group would be too small to be statistically adequate. After much experimentation, it seemed that a minimum of 20 cases was necessary; this would give about 200 annual yields or data points, about half of which would be below the average. This appeared to be the minimum necessary to give sufficient statistical smoothness for interpolation of premium rates corresponding to each non-indemnifiable limit. Hence the following procedure was adopted. All cases of a given crop in a state are classified by their CMD values so that in each CMD group there are about 20 cases. Naturally, the CMD groups are much broader in range than those indicated above. All the cases in each CMD group are pooled together for the preparation of the Premium Tables.

Subsequent steps except (vi) as modified later remain unchanged. Important change is in step (vi). This relates to conversion of z and Z values which are expressed in units of mean deviation MD into percentages of the ten-year average M. Earlier this was done by multiplying the z and Z values by the mid-value of CMD in each group. This was not so unsatisfactory because the CMD group was narrow with a range of only about five percentage points such as 10 to 15 per cent. With only a single crop and the condition that each CMD group should have about 20 cases, the CMD groups are now much broader and the use of the mid-value of CMD for a group would not be satisfactory. Hence, the conversion of z and Z, which are expressed in units of the mean deviation MD, into percentages of the ten-year average M, is now done separately for each case in the CMD group by multiplying z and Z values by the respective CMD of each case. Subsequent steps remain unchanged. This means that, though a number of cases of a crop are pooled together for the determination of Z corresponding to given z, final Premium Tables are prepared separately for each case. In other words, separate Premium Tables are prepared for each case, that is for each given crop in each given area. The formula for premium is

$$\text{Premium} = \frac{\text{CMD}\ (Z - nz)}{N(1 - \text{NIL}/100)}$$

The new procedure was introduced beginning with 1982-83 and continued in 1983-84.

In the meanwhile, the GIC requested us to repeat the statistical exercise (i to xii above) but now distinguishing cases with premium (a) five per cent or less; (b) 5.25-7.50 per cent; (c) 7.75-10.00 per cent; and (d) more than 10 per cent. The exercise was done for 12 states and results submitted to the GIC. As typical, we present in Table 3, the results relating to Andhra Pradesh. It will be noticed that in the cases with premium of five per cent or less, in three out of 10 years the indemnities payable are in excess of the premia receivable. In the other cases, the indemnities exceed the premia in 4 out of 10 years. The difference between the low premium cases and other cases in this respect seems to be only a chance difference. There are no systematic differences between the several groups of cases with different premia. In all cases, the total premia receivable exceeds by a small margin the total indemnities payable; as explained earlier, the excess was deliberately allowed for covering the administrative expenses. In Table 4 is given the all-India summary of these results.

These exercises are useful to demonstrate the validity of our procedures. They do not show any essential differences between cases of high and low premia because all cases are subject to identical procedures. All Premium Tables equate, over the ten-year period, premium with indemnity plus a small charge for administrative expenses. Small differences in this respect are due to approximations arising out of grouping of cases.

The indemnities payable will of course vary from year-to-year and hence in some years may exceed the premia receivable. The exercises show that this may happen in about one third of the years. This should concern an agency such as the GIC. Of even greater concern to such an agency is how often it may experience a succession of such adverse years. The above exercises are not useful to judge this question because though the basis of the Premium Tables is the experience of the past ten years, and though there is a presumption that this experience will recur in future, there can be no presumption that the ten years' experience will repeat itself in the same order. Hence, to judge the question raised above, one must randomise the ten years' experience over a long series, cumulate the indemnities and premia and find how frequently the cumulated indemnities exceed, and by how much, the cumulated premia. We did this exercise for each state separately. The results are presented in Table 5.

For each of the 12 states, a hypothetical series of 1000 years' yield data was constructed by supposing that the previous ten years' yield experience will recur but in a random order. Applying the Premium Tables to the 1000 years' series, the premium receivable and indemnities payable each year were computed. These were cumulated and the cumulated premia were compared with the cumulated indemnities. Table 5 shows in how many years (in percentage) the cumulated premia were less than the cumulated indemnities, in how many years the cumulated premia exceeded the cumulated indemnities by upto 5 per cent, by 5-10 per cent and by more than 10 per cent. For instance, in Andhra Pradesh, in 3.80 per cent years the cumulated premia would fall short of the cumulated indemnities; in 50.20 per cent years the cumulated premia would exceed the cumulated indemnities but by not more than five per cent so that administrative expenses would not be fully met; in the remaining 46.0 per cent years the cumulated premia would exceed the cumulated indemnities by 5-10 per cent which is more or less adequate to cover the administrative expenses.

There are naturally some differences between the states because the previous ten years' experience is not identical in all the states. But the situation in Gujarat and Uttar Pradesh appears rather widely different from that in the other states. For instance, in Gujarat, in 19.80 per cent years the cumulated premia would fall short of the cumulated indemnities and in another 67.60 per cent years, the cumulated premia would exceed the cumulated indemnities by not more than 5 per cent. In Uttar Pradesh, in 15.50 per cent years, the cumulated premia would fall short of the cumulated indemnities and in another 8.70 per cent years, the cumulated premia would exceed the cumulated indemnities by not more than 5 per cent. In both the states, two of the previous ten years were particularly bad. For instance, in Gujarat, in 1972-73, the indemnities payable amounted to 2.8 times the premia receivable; and in 1974-75, the indemnities payable amounted to 3.14 times the premia receivable. In Uttar Pradesh, for which we have only 9 years' data, in 1974-75, the indemnities payable amounted to 3.04 times the premia receivable; and in 1979-80, the indemnities payable amounted to 4.18 times the premia receivable.

But there is no reason to suppose that this particular experience in Gujarat and Uttar Pradesh is characteristic of these states and that therefore it may recur in future with similar frequency. On the other hand, there is no reason to suppose that, in the other states, because similar experience did not occur in the previous ten years, it may not occur in future. Hence, without denying certain differences between the states, we may take an average of the 12 states series and see what may happen on the average. This is done in the second line from the bottom. It will then be seen that in 3.61 per cent years, the cumulated premia would be short of the cumulated indemnities; in 22.74 per cent years the cumulated premia would be more than the cumulated indemnities by upto five per cent; in 34.61 per cent years the cumulated premia would exceed the cumulated indemnities by 5-10 per cent; and in 39.04 per cent years the cumulated premia would exceed the cumulated indemnities by more than 10 per cent. This may be considered as to what may happen in each state on the average. It may also be considered as to what may happen at the all-India level if the previous ten years' experience in the 12 states is combined in a random manner at the all-India level.

The phenomenon at the all-India level may also be judged in an alternative manner by taking as the basis the previous ten years' experience at the all-India level and constructing a 1000 years' series by randomising that experience as we did for each state. We did this on the basis of the combined experience of the 12 states for the period 1972-73 to 1981-82. The results are given in the last line of Table 5. It will be noticed that in no year the cumulated premia would be short of the cumulated indemnities; also in no year the excess of

TABLE 9: PREMIUM RATES FOR 80 PER CENT OF FIVE-YEAR AVERAGE AS THE GUARANTEED YIELD

| State | Number of Cases with Premium Rates | | | | | | | | Total | Average Premium |

cumulated premia over the cumulated indemnities would be less than 5 per cent; in 47.25 per cent years the cumulated premia would exceed the cumulated indemnities by 5-10 per cent; and in the remaining 52.75 per cent years the cumulated premia would exceed the cumulated indemnities by more than 10 per cent. It means that judging by the experience of the period 1972-83, if crop insurance scheme is introduced for all crops and areas for which we had prepared the Premium Tables, the chances of the insurance agency going in the red are less than one in thousand.

Next problem to tackle was recognised from the beginning and emphasised by almost all state governments, namely, that the ten-year average, as a basis for determining the guaranteed yield, was unsatisfactory because in many cases the annual yields had increased over the period. It was suggested that the average of the last three years or the average of at most last five years should be taken as the basis for determining the guaranteed yield. After considerable statistical experimentation, the following method was evolved.

The first point to recognise is that, whether we use the five year or the three year average for determining the guaranteed yield, ten years' annual yields will be necessary to determine the year-to-year variability. This is a crucial parameter in the crop insurance scheme and an estimate of it based on fewer than 10 observations will not be satisfactory. Hence, we begin with ten years' annual yields as before.

The major departure now is in the estimate of the year-to-year variability. Earlier, the mean deviation from the ten-year average M, called MD, was taken as an estimate of this variability. Now, if there is in fact a secular change in the annual yields over the ten-year period, a part of the year-to-year variability is not random but is secular or systematic. This must be discounted. For this purpose, we first estimate the secular change in yields by a linear time trend given by

$$Y_t = M + b(t - 5.5)$$

where $Y_t$ is the 'expected' or 'trend' yield in the t-th year; M is the ten-year average yield; b is the estimated annual change in yield, a positive value of b indicating an increase in the yields and a negative value of b indicating a decline in yields; the ten years are given t values from 1, 2, . . . 10 so that 5.5 denotes the middle of the period. The annual change given by b is estimated by the Method of Least Squares. The mean deviation of the annual yields from the corresponding 'expected' or 'trend' yields is called the residual mean deviation. It provides an estimate of the year-to-year variability after allowing for a linear time trend in annual yields. We shall denote it by RMD. This divided by the ten-year average M and multiplied by 100 gives the coefficient of residual mean deviation. We shall denote it by CRMD. The RMD and CRMD replace MD and CMD respectively in the previous procedure. In particular, the standardised yields are now given by

$$z = \frac{(y - Y)}{RMD}$$

where y is the annual yield, Y is the corresponding 'expected' or 'trend' yield, and RMD is the residual mean deviation; negative values of z give the shortfall from the 'expected' or 'trend' yield. The remaining procedure remains unchanged.

Thus the formula for the premium is now modified as

$$\text{Premium} = \frac{\text{CRMD } (Z - nz)}{N(1 - NIL/100)}$$

$$\text{where } z = \frac{(y - Y)}{RMD}$$

With this premium, the guaranteed yield should be based on the yield 'expected' in the current year. For instance, on the basis of the linear trend

$$Y_t = M + b(t - 5.5)$$

the yield expected in the current year (t = 11) is given by

$$Y_{11} = M + 5.5b$$

and the guaranteed yield would be $Y_{11}(1 - NIL/100)$. We did not choose this for two reasons. First, it might be too abstract to be explained to the farmers. Second, as a matter of caution, it is not advisable to use results projected into the future beyond the actual experience. The alternative was to choose the average of the last three years or the average of the last five years as the basis of the guaranteed yield. A three-year average is of course to be preferred because, compared to the five-year average, it makes greater allowance for the time trend in yields. A defect of the three-year average, as compared to the five-year average, is that it would be more variable from year-to-year and to that extent the guaranteed yield will also vary more from year-to-year; this may cause unfavourable response. On balance of considerations, we decided to accept the three-year average as the basis for the guaranteed yield. The guaranteed yield now is $M_3$ (1 − NIL/100) where $M_3$ is the average of the last three years. We may note that in accepting the three-year average instead of the yield 'expected' in the current year as the basis for the guaranteed yield, we are treating unfavourably the cases where the yields have shown an increasing trend; we are giving them a guaranteed yield lower than what we could have or charging them a premium higher than we could have. The reverse is the situation in cases where the yields have shown a declining trend.

The new procedure was introduced for the rabi season of 1983-84 in Uttar Pradesh and extended to all crops and all the 12 states in the year 1984-85. A total of 3690 Premium Tables were prepared. Their distribution according to the crop is as under:

| | |
|---|---|
| Kharif rice | 1368 |
| Other rice | 719 |
| Wheat | 391 |
| Millets and gram | 604 |
| Other crops | 608 |
| Total | 3690 |

In Tables 6 and 7, we present information on two parameters of these cases. One is the annual rate of change as revealed by the linear time trend. We shall express it as percentage of the 10-year average. In other words, we shall give a classification of the cases by the value of (b/M) × 100. We have classified the cases in seven classes as follows: (b/M) × 100 (i) 5 or more; (ii) 4-5; (iii) 3-4; (iv) 2-3; (v) 1-2; (vi) 0-1 and (vii) less than zero, that is a negative rate of change, being the cases of declining yields. The results are shown in Table 6 separately for five groups of crops. For instance, in kharif rice, out of a total of 1,368 cases, only in 296 cases the annual increase in yield was five per cent or more of the 10-year average. On the other hand, in 392 cases, there was a decline in annual yields. Higher the annual increase, the higher is likely to be the 3-year average compared to the 10-year average and hence the higher is likely to be the guaranteed yeild. In the cases of declining yields, the 3-year average is likely to be lower than the 10-year average and hence the guaranteed yield is also likely to be lower than one based on the 10-year average. It will be noticed that cases of declining yields appear in substantial numbers in all the crops though relatively fewer in wheat. In wheat, out of 391 cases, in 163 cases, the annual increase was five per cent or more of the respective 10-year average while in 30 cases, the yields declined.

The other parameter of interest is the ratio of CRMD to CMD. As explained earlier, if there is a secular change in annual yields, a part of the year-to-year variation in yields which we measure by CMD is due to the secular change; and CRMD gives a measure of residual variation after allowing for the secular change.

Hence, in general, CRMD should not exceed CMD. The smaller the CRMD compared to CMD, the smaller would be the new premium compared to the old premium. How much smaller CRMD compared to CMD would be depends upon the statistical realiability of the secular trend. Thus, even a high rate of increase may not be statistically reliable in which case the CRMD might not be much less than the CMD. On the other hand, even a low rate of increase, or for that matter even a decline in yields, may be statistically reliable in which case CRMD might be substantially less than CMD. In fact, the statistical reliability, called the statistical significance, of the secular trend may be judged by the ratio of CRMD to CMD. In Table 7, we give a classification of the cases by the CRMD expressed as percentage of the CMD again separately for the five groups of crops. Like we made seven classes according to the value of (b/M) × 100, we have made seven classes according to the value of (CRMD/CMD) × 100. They are: (CRMD/CMD) × 100, (i) 100 or more; (ii) 90-100; (iii) 80-90, (iv) 70-80; (v) 60-70; (vi) 50-60; and (vii) 0-50. For instance, among 1,368 cases of kharif rice, in 336 cases, the CRMD is not less than the CMD while in 15 cases, the CRMD is less than half of the CMD.

Some explanation is necessary for the cases in which the CRMD exceeds the CMD. We said above that, in general, the CRMD being the coefficient of residual variation should not be greater than the CMD being the coefficient of total variation. However, this is strictly true of the Standard Deviation (SD) and not of the Mean Deviation (MD) as the measure of variation. This is because of the Method of Least Squares by which we estimate the linear trend is connected to the Standard Deviation and not the Mean Deviation. Hence, we do get cases where the CRMD exceeds the CMD. But the excess is usually small and no importance need be attached to it. These cases may be treated as cases in which the CRMD is not substantially less than the CMD.

The advantages of the new procedure in which we take cognisance of possible secular change in yields is two-fold: (a) A high rate of annual increase raises the guaranteed yield; and (b) A CRMD substantially lower than CMD reduces the premium. In cases where the CRMD is not substantially lower than the CMD, not only the premium is not much reduced but it indicates that the time trend is not reliable and hence the 3-year average may fluctuate widely from year to year. For this reason, we thought whether we should make a distinction between cases in which the CRMD is or is not substantially lower than the CMD and apply the new procedure to only the former cases while continuing the earlier procedure in the other cases. We decided against it for two reasons. First, the distinction may not be generally understood. Second, the reliability of the time trend may itself change from year to year. Hence we decided that the new procedure should be applied to all cases uniformly. It is essential to adhere to this. In particular, a suggestion may come that one may take the 10-year average or the 3-year average whichever is higher. This is not admissible because it may cause adverse selection.

As we have already noted, the present formula is biased against cases with high rates of annual increase in yields and is biased in favour of cases with declining yields; it charges higher than the correct premium in the former cases and lower than the correct premium in the latter cases. To judge the extent of this bias, we have classified the cases of each crop or crop-group into three classes: (i) with b/M negative, (ii) with (b/M) × 100, 5 or less; and (iii) with (b/M) × 100, more than 5. For each class of cases, we did a statistical exercise and estimated the total indemnities payable and total premium receivable if the formula was applied over the past 10 years. As the present formula requires the average yield of the previous three years, the estimates of indemnities and premium could be available only beginning with the fourth year. We have thus estimates of total indemnities payable and premium receivable over a 7-year period from the fourth to the tenth year. These are given in Table 8.

If we consider all cases together it will be seen that the total premium receivable (Rs 136,935.10) is slightly less than the total indemnities payable (Rs 140,544.84); in fact the premium receivable is 97.43 per cent of the indemnities payable. The reason is that the above mentioned biases do not compensate mutually. If we take the middle group of cases, where the annual rate of increase in yields is positive but not more than five per cent of the 10-year average, it will be seen that the total premium receivable (Rs 51,987.35) is a little more than the total indemnities payable (Rs 50,6959.68); in fact the premium receivable exceeds the indemnities payable by 2.62 per cent. But if we consider the group of cases with negative annual increase, the total premium receivable (Rs 43,703.00) is only 69.08 per cent of the total indemnities payable (Rs 63,267.61). On the other hand, for the group of cases with annual increase more than five per cent of the 10-year average, the total premium receivable (Rs 41,244.75) is 54.95 per cent in excess of the total indemnities payable (Rs 26,617.55). Clearly, our present formula greatly favours the cases of declining yields against cases of high rates of annual increase. Obviously, the present formula must be soon replaced by the correct formula.

To derive the correct formula for the premium, we note the following: (i) When we take into account the time trend in yields, the z values are defined as

$$z = \frac{(y - Y)}{RMD}$$

namely the deviation of the current yield y from the corresponding 'expected' yield Y expressed in units of the Residual Mean Deviation, RMD. Hence,

$$\frac{(Z - nz)}{N}$$

gives the average of all deviations as large or larger than a given z, measured from the given z, and expressed in units of RMD. (ii) In the present procedure, the guaranteed yield is a certain proportion of the 3-year average which we may write as $G = M_3P$ where $M_3$ is the 3-year average and $P = (1 - NIL/100)$. Let

$$z^* = \frac{(G - Y_{11})}{RMD}$$

where $G = M_3P$ is the guaranteed yield and $Y_{11}$ is the yield 'expected' in the 11th that is the 'current' year. We need to know the average deviations of the actual yields from the expected yield, expressed in units of RMD, as large or larger than $z^*$ and measured from $z^*$. In other words, we need to know

$$\frac{(Z - nz^*)}{N}$$

This is expressed in units of RMD. If we express it as percentage of the guaranteed yield, we get the premium. Hence,

$$\text{Premium} = \frac{(Z - nz^*)}{N} \times \frac{RMD}{M_3P} \times 100$$

To each $P = (1 - NIL/100)$, we get a premium rate. We should choose the P so that the premium does not exceed 5 per cent as has been our policy.

Recently, the Government of India has announced a scheme of crop insurance more or less on the lines developed in the past decade but one in which the guaranteed yield and the premium rate are kept fixed and uniform for all crops in all the states. Reportedly the guaranteed yield will be 80 per cent of the average yield for the previous five years and the premium will be two per cent of the sum assured in the case of rice, wheat, and millets and one per cent in the case of pulses and oilseeds. The scheme has the great advantage that the guaranteed yield and the premium rate are fixed and constant. For that reason, there will be no need to compute and determine these parameters every year. But unlike the schemes we have so far developed, the new scheme will not be self-financing in respect of each crop in each state; there will be losses in some cases and gains in others. Overall, it seems that the government will suffer some loss which of course will be fully justified considering the importance of crop insurance for agriculture. It will be useful to indicate the cases where the government is likely to make some gains and cases where it may suffer some loss; and the extent of overall losses that the government may suffer.

For this purpose, we must compute the correct premium in each case and compare it with the prescribed two per cent or one per cent premium as the case may be. In the above, we have indicated the correct formula for premium in the case where the guaranteed yield was a certain proportion of the three-year average, the particular proportion to be chosen so that the premium rate may not exceed five per cent. In the present case, the guaranteed yield is prescribed to be 80 per cent of the five-year average. In other words, $G = M_5 \times 0.8$ where $M_5$ is the five-year average. To determine the correct premium, we define

$$z^{*} = \frac{(M_5 \times 0.8 - Y_{11})}{\text{RMD}}$$

so that

$$\text{Premium} = \frac{Z - nz^{*}}{N} \times \frac{\text{RMD}}{M_5 \times 0.8} \times 100$$

In Table 9, we give, for each state and for each crop, the distribution of the premium rates and their average. The average premium is to be compared with two per cent of one per cent premium rate proposed in the new scheme. If the average premium is more than the proposed rate, the scheme will make losses; if it is less than the proposed rate, the scheme will make gains. Supposing that the amount insured is more or less evenly spread over all the areas in each state, the difference between the average premium rate and the proposed rate gives the extent of gains or losses expressed as percentage of the sum assured. For instance, if the average of the correct premium is 3.5 per cent and the proposed premium is 2.0 per cent, the government will make a loss of 1.5 per cent of the sum assured. On the other hand, if the average of the correct premium is 1.5 per cent and the proposed premium is 2.0 per cent the government will make a gain of 0.5 per cent of the sum assured. Incidentally, it may be noted, the premium rates as calculated above do not allow for any administrative expenses. These must be duly added to the estimated losses or subtracted from the estimated gains.

The premium rates as computed above are based on the data of the past ten years. These have to be updated every year. Because the premium rates are now fixed uniformly for all areas, the correctly computed premium rates are not needed for operational purposes. Hence their computation every year is likely to be neglected and soon discontinued. This will be undesirable. Every insurance scheme must evaluate its own experience periodically and keep its data updated for the purpose. Hence we emphasise that, even though the correctly computed premium rates may not be needed for operational purposes, the technical work must continue as if these were needed. Further we may note that though the guaranteed yield is based on the five-year average, the determination of the time trend in the annual yields utilises annual data over ten years. The agency in charge of the technical work of the scheme must insist on obtaining these data from the respective state governments regularly; it must subject these data to careful scrutiny particularly its consistency with the data submitted in the previous year; it must annually compute the correct premium and estimate losses or gains that the government is likely to make; and it must compare these estimates with actual experience peridodically. The crop insurance scheme is founded on the annual estimates of crop yields based on crop cutting experiments. Neglect of this base may prove financially disastrous.

The present crop insurance scheme is based on the Area Approach and a taluka/tehsil is generally taken to be the 'area'. The indemnities payable to farmers in the area are assessed on the basis of the average yield for the area and variations in yields within the area are neglected. This is considered unsatisfactory and there is a growing demand that the scheme should be made applicable to smaller areas such as the development blocks.

APPENDIX: GENERAL INSURANCE CORPORPATION OF INDIA—PILOT CROP INSURANCE SCHEME

| State | Crop | Season | No of Areas | No of Farmers | Sum Insured (Rs) | Premium (Rs) | Total of Claims (Rs) | Claim Ratio (Per Cent) |
|---|---|---|---|---|---|---|---|---|

This is of course desirable; but it will require a much larger number of crop-cutting experiments to be conducted every year. In order to get the scheme started, we had advised the state governments that, in order to make the scheme applicable to any 'area', there should be at least 15-20 experiments on each crop in the 'area'. Even this modest requirement has not been often met. On the basis of past experience, it seems to us that we should ask for at least 25 crop-cutting experiments on each crop in an 'area' in order to apply the crop insurance scheme to that 'area'. For the condition to be fulfilled for each development block, the crop-cutting experiments may have to be expanded generally at least four-fold, and many more times in some areas, before the scheme may be applied for each crop in each block. This may prove too expensive. It is sometimes proposed to supplement the crop-cutting experiments presently being done for estimation of crop output by additional experiments specifically for the crop insurance scheme. This would be undesirable. The crop insurance scheme must be based on the general crop-cutting experiments done for estimation of crop output. Hence, if any expansion of the crop-cutting experiments is done, it should also go into the estimation of crop outturn. The reason is obvious. Any sudden expansion of crop-cutting experiments may also lead to deterioration in the standards of that work. This is equally undesirable. In the circumstance, we urge serious consideration of an alternative we had suggested in our original proposal, namely, that in each area, instead of a separate scheme for each crop, we should have a single crop insurance scheme for all crops taken together on the basis of a composite index of production. In the light of the experience gathered in the last few years, we would now modify this proposal and suggest that for each area, two crop insurance schemes, one for the kharif crops taken together and the other for the rabi crops taken together should be prepared. The proposal has two main advantages. First, it will require only a moderate expansion of crop-cutting experiments; because now we would need about 25 experiments on all kharif crops taken together and all rabi crops taken together. Second, if there are only two schemes in place of several schemes one for each crop, the administrative expenses will be reduced to that extent.

The last mentioned consideration, namely the administrative expenses, must receive the most serious consideration; otherwise there is the danger of the bureaucracy benefiting more than the farmer. It was with this consideration in mind that we had also suggested that the crop insurance scheme should be made compulsory to all borrowing farmers or for a specific section of the borrowing farmers such as the small farmers defined by their credit eligibility. In view of the recent initiative taken by the government it will be now natural to make the crop insurance compulsory to all borrowing farmers. It will integrate the crop insurance with the crop loan and there will be no need to issue separate policies to each insured farmer. Crop loan insurance will be a part of the terms and conditions of the crop loan. This will mean almost no additional administrative costs on account of crop insurance. It will also protect agricultural credit from the hazards of agriculture. Now that the government has taken the initiative and agreed to bear the residual burden, it is time to make crop insurance a part and parcel of agricultural credit rather than administering it as an independent scheme by an independent agency.

# Transition from Subsistence to Commercialised Agriculture

## A Study of Krishna District of Andhra, C 1850-1900

**G N Rao**

*This paper traces the agrarian transformation brought about by canal irrigation under the Krishna dam and links it with the process of commercialisation of agriculture. It also considers paddy—which is normally taken to be a subsistence crop—as a catalytic agent which successfully exploited the technological changes in the infrastructure and injected dynamism into agriculture. The paper argues that a so-called subsistence crop like paddy can play a progressive role—progressive in the limited sense of enabling the cultivators to produce for the market, accentuating the process of monetisation and making cultivators look upon agriculture as something more than a 'way of life'.*

### I

### Introduction

THE primary objective of this exercise is to trace the agrarian transformation brought about by canal irrigation under the Krishna anicut (dam), and link it up with the process of commercialisation in agriculture. An unconventional aspect of this study is to consider paddy—which is normally taken as a "subsistence crop"—as a catalytic agent that successfully exploited the technological changes in the infrastructure and injected dynamism into agriculture. It is argued here that a so called subsistence crop like paddy can play a progressive role—progressive in the limited sense of enabling the cultivators to produce for the market, accentuate the process of monetisation and make the cultivation look upon agriculture as something more than a 'way of life'.

The specific questions that are sought to be answered in the study are the following:

(i) How did the Krishna farmers respond to irrigation?

(ii) Were there any built-in disincentives under the colonial regime which slowed down the agrarian expansion and growth?

(iii) Why and how could a "subsistence crop" like paddy transform itself into a "Commercial Crop" in the area?

(iv) How did the farmers respond to the emerging food-surpluses?

(v) What was the role played by the farmers and traders in the paddy-market?

(vi) Could the transport facilities rise to the occasion?

(vii) How did the process of commercialisation affect the (a) credit, (b) land, and (c) labour markets?

Section II gives a brief outline of the subsistence character of agriculture in the pre-anicut period and makes the point that the tax-burden on cultivators was one of the major obstacles in the way of growth. Sections III and IV document agrarian expansion, changes in the cropping pattern and the emergence of food surpluses respectively. Section V highlights the problems caused by expanding but inadequate transport facilities. Section VI seeks to comment on commodity markets and trade. Sections VII-IX analyse the impact of commercialisation of agriculture on credit, land and labour markets respectively.

### II

### Pre-Anicut Period

The agrarian economy of Coastal Andhra was in a state of stagnation followed by decay in the first half of the 19th century. The introduction of Permanent Zamindary Settlement during 1802-04 had strengthened the forces of exploitation in agriculture. Unfavourable seasons, depression in agricultural prices, abolition of "Government Factories" in 1829 and consequent outmigration of weavers, famines and decline in cropped area had not only caused a sharp fall in land revenue but also accentuated the miseries of the agricultural community. Exports of piece goods, for which the region was so famous in earlier times, fell at an alarming rate. The frequent occurrence of droughts and famines also slowed down the rate of growth of population, resulting in forced cultivation and use of torture in the collection of land revenue. Irrigation was neglected and transport by road and water was in a miserable state of affairs. In short, cultivation became an unprofitable proposition during the first half of the 19th century.[1] It was at such a time that an anicut (irrigation dam) was thrown across the river Krishna at Bezwada (Vijayawada) in the early fifties.[2] Irrigation injected forces of dynamism into the agrarian economy. However, these potentialities could not be exploited fast during the initial period owing, among other things, to the continuation of a system of burdensome taxation on the cultivators. Eager to realise a quick return on the investment in irrigation, the government of the day thoughtlessly tried to squeeze as much revenue as possible from the cultivators. By around 1855, i e, the year of completion of the Krishna anicut, there was about 20,65,266 acres of cultivable land in the district of which about 59 per cent was under cultivation. (Krishna district of the period of study included not only the Krishna district of the present times but also portions of Guntur and Prakasam districts. Thus, it included the taluks of Gudivada, Bunder, Bezwada, Nandigama, Repalle, Bapatla, Sattenapalli, Narasaraopet, Vinukonda and Palnad.) Of the occupied land as much as 88 per cent was under dry cultivation. Per acre assessment on wet lands varied from an average of Rs 3.44 in the Masulipatam Division to Rs 6.50 in the Guntur Division of Krishna district.[3] Over and above this assessment, a water tax of Rs 3.59 and Rs 4.00 per acre in the Masulipatam and Guntur divisions increased the total assessments to Rs 5.94 and Rs 10.50 in these two areas. Cost of cultivation came to about Rs 4.10 per acre. In other words, total expenses borne by the cultivators on an acre of land came to Rs 11.94 in Masulipatam and Rs 14.60 in Guntur Divisions. Taking the value of gross produce at Rs 16.58 per acre, the net profit to a cultivator turned out to be Rs 5.54 in Masulipatam and as low as Rs 1.98 in Guntur. Thus, the total tax burden in relation to surplus stood at 1.07 in Masulipatam and 5.30 in Guntur.[4] This high rate of taxation acted as an impediment to agricultural expansion and growth in the immediate post-anicut period.

### III

### Agrarian Expansion

The survey and settlement operations were commenced in 1859 in the Masulipatam Division and in the early sixties in the Guntur Division. In the Masulipatam Division it was proposed to charge from Rs 2.50 to Rs 7.00 per acre on irrigated land and from annas[5] four to Rs 4.00 for unirrigated land. Seventy-seven per cent of the land was under pure loamy Regar in Masulipatam. In Guntur as much as 90 per cent of the total area was under varieties of "Regar". Black cotton soil and red soil formed only two per cent. The land revenue rate on irrigated land in Guntur varied from Rs 1.75 to Rs 7.50 and on unirrigated land from annas four to Rs 4.59 per acre.[6]

Table 1 gives an account of the progress of cultivation of ryotwari (government) lands. Wet cultivation could make some progress till mid-sixties but showed a decline in the latter half of the decade. The early seventies showed a recovery except for the famine period of 1876-77. Dry cultivation showed a steady progress throughout the sixties but a marked decline was noticeable in the early seventies.[7]

Table 1 obviously gives only a partial picture as it does not throw light on the inam and zamindary areas. Table 2 gives a comprehensive picture of land under all the three tenures.[8]

### REASONS FOR FLUCTUATIONS IN WET AREA

The inefficient system of water-distribution, poor water management by the cultivators, land turning saline—"choudu"—when watered, and a high water tax appear to be the four principal reasons for the tardy and varied progress of wet cultivation in the Krishna district.

Land was first taken up near Kankipadu on the Masulipatam side and Duggirala on the Guntur side.[9] As the works progressed, water was sent down the Pullasur Channel on the one side, and the Tungabhadra on the other. Great eagerness was shown by the cultivators to have water for their land. Wet cultivation was earnestly taken up on either side of the river and the revenue rose steadily at the rate of rupees one lakh a year. This went on from 1857 to 1864. In the year 1864, it was realised that the demand for water was far exceeding its supply. Subsequently, a great apprehension was felt regarding adequate supplies of water. It was feared that the crop would fail for want of enough water just at the critical period of ear-filling in October.[10] On each occasion, however, a fortunate rise in the river or an opportune fall of rain saved it from destruction, but it did not prevent losses in many tracts. These tracts being on a higher level, or otherwise unfavourably situated could not receive enough water. Hence, distrust began to be felt in these areas on the ability of the anicut to supply water to all the needy tracts.

In the post-anicut period a great deal of land was taken up that was better suited for dry than wet cultivation. People had gradually found this out, but the rigid nature of water-rules prevented them from reconverting their wet lands into dry. As a result of such indiscriminate and over application of water for all lands, saline efforescence or "choudu" had set in, rendering some lands unfit for cultivation.

Once the affected farmers realised that some of the irrigated lands were subject to the evil of "choudu", a reaction was set in pleading for permission from the revenue authorities to reconvert their wet lands into dry. This was hastened by the disaster suffered in a cyclone in 1864 which desolated the district. Although dry crops suffered more than the wet, irrigation suffered a set back, as the cyclone, "swept off 22,000 men, women and children besides an enormous number of cattle and an untold amount of property".[11]

The problem of reconversion of wet lands into dry was more acute in the Repalle taluk. Almost at the same time when the calingulahs on the western bank channel at Kollur and Vellatur were completed, ryots refused to take up any land under these canals. Thornhill who went personally to investigate the matter described the situation quite graphically:

> I was myself encamped for ten days at Kollur in 1867, and had much conversation with the people about the work: they explained that the land commanded by the calingulah was the very best quality of alluvial dry soil, that it yielded more than two crops of dry grains and that where water had been applied to land similar to it, the soil had so often been spoiled by 'soudoo' (choudu), that they dreaded the experiment and positively refused to have anything to it.[12]

Thornhill went to convince the ryots about the utility of reconverting their dry lands into wet, but rather he appeared to have been convinced on the company by the forceful arguments of the ryots! He observed:

> Any one who has seen the western banks of the Kistna from the anicut to Repally covered with cholum, Bengal gram, varagee (variga) coriander seed and all the varieties of pulses and garden crops, could bear testimony to its wonderful fertility, and it is not a matter of surprise that the ryots should shrink from an experiment which might have given them increased income for a few years, but which their experience told them was too likely to convert much of their beautiful land into desert.[13]

The Board of Revenue had grudgingly recognised the evil of "choudu" in the Krishna district and allowed free option

TABLE 1: GOVERNMENT (RYOTWARI) LAND UNDER CULTIVATION, KRISHNA DISTRICT

*(in acres)*

| Averages for the Years | Wet Land | Dry Land | Total Cultivated Land* |
|---|---|---|---|
| 1859/60-1863/64 | 1,56,814 | 13,32,518 | 14,99,741 |
| 1864/65-1868/69 | 1,52,354 | 14,41,413 | 15,95,843 |
| 1869/70-1873/74 | 1,58,826 | 15,37,000 | 16,95,707 |
| 1874/75-1876/77 | 1,78,576 | 12,29,074 | 14,07,657 |

*Note*: * Total cultivated land includes wet, dry as also garden lands. As data on garden land are available only for four years i e, from 1859/60 to 1862/63, they are not separately shown in the above Table.

*Source*: Proceedings of Board of Revenue, May 8, 1978, pp 4109-22.

TABLE 2: STATEMENT SHOWING 4-YEARLY AVERAGE AREAS UNDER IRRIGATION UNDER ALL CHANNELS OF THE KRISHNA IRRIGATION SYSTEM, KRISHNA DISTRICT

| Period | Total Area under Irrigation* (in Acres) | Remarks |
|---|---|---|
| 1859/60-1862/63 | 1,31,161 | Period of expansion |
| 1863/64-1866/67 | 2,00,117 | Period of Stagnation |
| 1867/68-1870/71 | 1,91,802 | |
| 1871/72-1874/75 | 1,23,451 | Period of steady expansion |
| 1875/76-1878/79 | 2,66,550 | |
| 1879/80-1882/83 | 2,89,522 | |

*Note:* * Totals include Ryotwari, Inam and Zamindary areas. For the period 1876-1882, the Zamindary areas irrigated have been estimated. The above Table does not include data on areas irrigated under other (non-Krishna) systems of irrigation. For more details see footnote 8.

*Source:* PBR, May 8, 1878, pp 4109-22 and "Reports on the Administration of Madras Presidency", Various Issues.

to the cultivators to take up or refuse water. For lands affected by "choudu", water was offered freely and without any payment so long as they continued to be barren. When the option was given to the ryots to continue or relinquish the anicut-water, they took immediate advantage of it, lest the option should be withdrawn. They started systematically reverting to dry crops every third year.[14]

The water-tax appears to be the other major hurdle in the progress of wet cultivation. Immediately after the construction of the Krishna anicut, the water-tax imposed was Rs 3.37 per acre. By 1878, it rose to Rs 3.89. This appears to have held back the expansion of wet cultivation.[15] In the zamindary areas it was also checked by violent conflicts between zamindars and tenants such as occurred in the Nuzuid zamindary in 1870.[16] The average rate of assessment in the government (ryotwari) taluk of Gudivada was Rs 5.81 per acre. Only on highly fertile lands, the rate went upto Rs 7.50. But in the neighbouring Nuzividu zamindary even on ordinary lands the charge was Rs 10 and above. Most of the zamindars of the Krishna district and especially the Nuzividu and Vallur were well off to assist their ryots in times of famines but they had been extremely unwilling to do so. As Boswell, the Officiating Collector of the district observed: "The idea is to get as much as possible out of the ryot and when no more is to be got out of him, let him go to the devil!"

With such a system of tax collection, agricultural expansion in general and wet cultivation in particular was bound to suffer. No wonder, between 1863 and 1872 the wet area in the zamindaries was almost stagnant. Even in the later period the growth was rather slow.

## IV

## Cropping Pattern

During a period of nearly two decades from 1877-78 onwards, the total cropped area under ryotwari and inam categories increased significantly; from a little over 18 lakh acres to nearly 23 lakh acres.[17] As agriculture expanded the share of food grains had declined while pulses registered a slight increase.[18] Overall, the share of food crops in the total cropped area fell by about four percentage points. Non-food crops enlarged their share of total cultivated area (Table 3). Among the major Non-food crops, however, cotton which was one of the important cash crops of the district during the first half of the nineteenth century registered a significant decline in terms of both area and share in the total land under cultivation during the last quarter of the century. While oil seeds maintained a steady level for quite some time the shares of indigo, condiments and spices and other minor crops in the total cropped area showed an increase.[19]

TABLE 3: CROPPING PATTERN IN THE KRISHNA DISTRICT (RYOTWARI AND INAM LANDS)

| Triennia | Total Area under Cultivation (in 000s) | As Percentage in the Total Cropped Area | | | |
|---|---|---|---|---|---|
| | | Foodgrains | Pulses | Total Area under Food Crops (3 + 4) | Total Area under Non-Food Crops |
| 1 | 2 | 3 | 4 | 5 | 6 |
| 1877-79 | 1,809 | 73.74 | 4.72 | 78.46 | 21.54 |

*Source*: (Annual) "Reports on the Administration of Madras Presidency", Various Issues.

Although the share of food crops in the total cultivated area declined over the period, rice increasingly became a major crop occupying well over one-fifth of the total cropped area. The share of rice in the total cereal-area increased from one-quarter in the 1870s to nearly one-third in the mid-nineties enabling the district to generate food surpluses.

### EMERGENCE OF FOOD SURPLUSES

In a historical study such as this, given the inadequate data, the compilation of a series of estimates of gross production, consumption and surplus, is a difficult task. The Board of Revenue, working on the basis of the sanitary commissioner's estimate of foodgrain requirements (1¼ lbs per head per day), calculated local consumption in 1875 at 296,000 tons. Seed would amount to another 28,000 tons. The Board took gross output to be 756,000 tons, leaving a surplus of 432,000 tons. However, it seems likely that their estimate of foodgrain area in the zamindaries was too high, and if we reduce it on the basis of the ascertained ratio of irrigated zamindari to other irrigated land in 1870-72,[20] and retain the Boards' yield estimate of 0.4125 ton per acre, gross output becomes 649,000 tons and the surplus 325,000 tons.

All that we can say is that the Board appears to have over estimated food surpluses, but the fact cannot be denied that a significant portion of the gross output was surplus.

## V

## Transport

There were some improvements in the

local transport system during our period but trade continued to be hampered by poor communication system.[21] Road mileage grew from 509 in 1877-78 to 562 in 1883-84. The increase in road mileage by the early eighties had given a fillip to trade. The number of bullock carts transporting goods increased from about 25,000 in the late seventies to a little over 62,000 by the late eighties.[22] The canal system was primarily designed for irrigation and this function often hindered its use for transport.[23] Its configuration also reduced its utility for trade. The cotton of Guntur for instance, could not be shipped direct to Cocanada.[24] The local sea ports were also neglected and their links with the hinterland poorly developed. It was some relief for the Krishna cultivator that a railway line along the east coast was laid in 1891-92. This went a long way in accelerating trade and augmenting the process of commercialisation of agriculture.

## VI

## Commodity Markets and Trade

So far we have tried to trace agricultural growth of the district taking into consideration the impact of irrigation on agricultural expansion, cropping pattern and "food surpluses". We have also examined the role of the built-in-disincentives of tax burden and an inadequate transport system acting as speed-breakers to the growth and transition to a commercialised agriculture till the early eighties.

As our series of data on transport system, *viz*, road mileage, boats, carts, etc, is not complete we cannot claim that these constraints on the growth and transition process had continued even for the latter period as well. Judging from the increase in the volume of trade and other qualitative evidence in the late eighties and thereafter, as we shall see in this section, it appears, that the constraints of tax burden and transport bottleneck were not acting as severely as they used to, till the early eighties. The Buckingham canal came quite handy to the Krishna cultivators and merchants to tap the grain markets of Madras and other Tamil districts. In the early nineties the coastal region, especially Krishna district, had come to benefit from rail-transport-a long standing demand of merchants and cultivators. As the price of grain, especially of paddy/rice was increasing, taxation ceased to be burdensome on the cultivators. Thus, the eighties and nineties was a crucial period for the agrarian economy of the district in undergoing a qualitative transformation.

As stated earlier "foodgrain surpluses" did emerge in the district although one might debate about its magnitude. Given the fact that rice had now become a staple food for some sections of the agricultural community, and that area under cholum and other crops was in fact increasing during the eighties and nineties, thereby indicating an increasing local demand for coarse grains, one would be surprised if the marketable (paddy/rice) surpluses were small, from the eighties onwards. In other words, we are postulating that with an increase in the area under paddy and increasing transport facilities (Buckingham canal, Masulipatam canal, etc, and Railways in the post-1890 period) and with the fast emergence of market towns of Guntur, Tenali and Bezwada, commodity markets (mainly in paddy) were emerging, widening the horizons of the paddy-growers. Paddy was slowly shedding its subsistence character and assuming commercial dimensions. The Krishna ryot was increasingly looking forward to selling his paddy/rice in the market towns. Though the peasant cultivator lacked familiarity with the market towns, coastal Andhra was not bereft of a trading caste, Komatis (Arya Vysyas), who traded in all commodities from piece goods to pulses, realised the potentialities of grain trade in the district. A large segment of Komatis who had over time settled down in the coastal towns expanded their family-based operations deep into the countryside. But this had stirred the forward looking sections of the Krishna cultivators especially the Kammas into the realisation that instead of depending on these Komati-traders they could directly transport their surplus grains to the market towns either by bullock-carts or by boats.

TABLE 5: PARTICULARS OF TRADE OF THE PORTS* IN THE KRISHNA DISTRICT

| Triennia | Total No of Vessels (Foreign and Native) | Tonnage | Value of | |
|---|---|---|---|---|
| | | | Exports Rs | Imports Rs |
| 1862-64 | 712 | 71,836 | 23,36,593 | 19,83,907 |
| 1865-67 | 593 | 74,632 | 35,94,975 | 21,45,174 |
| 1868-70 | 751 | 82,527 | 29,87,611 | 23,86,707 |
| 1871-73 | 618 | 98,029 | 23,90,600 | 16,60,875 |

| Period | Despatched to | | Total Bales Including Other Stations |
|---|---|---|---|
| | Cocanada | Madras | |
| 1882-86 | 18,214 | 4,843 | 23,057 |
| 1887-91 | 22,113 | 2,558 | 27,364 |
| 1892-96 | 20,202 | 5,782 | 26,901 |
| 1897-1901 | 17,100 | 12,834 | 29,934 |

*Source:* Board of Revenue (Revenue, Settlement, Land Records and Agriculture), No 463, December 17, 1903.

> In Bezwada there is a regular corn exchange where the price of paddy is fixed daily by the ryots with their samples, and the buyers are either merchants who buy on commission for Madras or agents of Bombay and Poona Companies. The Tenali prices are ruled by the prices fixed at Bezwada, Masulipatam, Madras, Secunderabad, etc. The merchants who buy or else the rich cultivators who are nearly all becoming traders *store their grain till prices have risen and bring it to Tenali. Paddy is exported wherever the highest prices is obtainable* . . . Paddy and rice were also sent to Bellary in case of scarcity there or to Vizianagaram or Bangalore.[25]

Another dimension was added to the grain trade. The Krishna cultivators realised that it was easier to export de-husked and boiled paddy as against raw paddy. Hence rice mills sprang up in many of the larger villages "*often built with the capital of the local ryots*"[26] (emphasis added).

> "Nearly every village has its hand-mills, often in considerable numbers and a large steam power rice factory is being built at Tenali."[27]

The numerous rice mills that came up in the villages had to compete with the traders of the nearby market towns.

> They could not hope for annually gutted markets or a succession of bad seasons to drive peasants into dependence on them. If their rates were not close to those offered in the main (market) towns, their mills, will grind to a halt.[28]

This led to a near integration of paddy markets in the district. The increasing awareness of the profitability of his produce made the Krishna ryot look around and watch the imports of grains from Burma and sell his produce at an appropriate time. As a Royal Commission on Agriculture put it:

> ... Once he (the ryot) has paid his land revenue (kist) he keeps a steady eye on the prices primarily for rice imports from Burma, and is *in no haste to come to towns with the agent or buyer if the towns do not suit him*. The better market for his produce (Madras and Tamil districts), is close at hand; he sells his husked rice to local mill-owners who hull it before passing on and are at least as much concerned to keep their mills working as they are to beat down the price.[29]

So much for the qualitative evidence on market towns, transition of paddy into a "commercial crop", awareness of the paddy growers about the markets and the dynamic and shrewd participation of the Krishna ryot to produce for and sell his commodity in the markets. But paddy was not the only agricultural produce that the ryot sold, although it became over time the major item of his interactions with the market.

As was stated in the earlier sections Krishna district was growing cotton on large scale in the mid-nineteenth century. But during the second half of the 19th century the cotton area had gradually decreased. Part of this decline could be attributed to the collapse of the cotton-boom in the mid-sixties.

The other agricultural produce that entered into the markets of the Krishna district were oilseeds. The dry taluks of the district increasingly relied on the cultivation of oil seeds which became a major item of the trade in the commodity market of the district.

Let us look at the quantitative dimensions of trade in the commodity market. Trade data of the district which are avilable in the official records are as patchy as those on transport. The following account tries, as far as possible, to analyse the composition of trade and indicate the broad trends emerging from an economy in transition.

For the sixties and seventies, data on composition of commodities traded are hard to come by. We have some data on the sea-borne trade of the district. Although the number of vessles involved in the sea-borne trade had not increased between 1862 and 1875, the tonnage of the ships showed a marked rise in the early seventies (see Table 5). The mid-sixties and early seventies witnessed a marked rise in the values of exports from, and imports into the district. Between them, the values of exports gained an edge over the values of imports.

The Guntur Division of the Krishna district had an upper edge over that of the eastern delta in terms of growth of non-food crops like cotton and indigo. Table 6 gives data on raw cotton despatched by Canal from the Guntur Division between 1882-83 and 1901-1902. Cocanada port in the neighbouring Godavari district and Madras city were the two major destinations of the Guntur cotton trade. As Table 6 shows, cotton trade did not make much headway in the direction of Cocanada. Trade towards Madras city, however, showed some promise in the nineties. The total quantity of raw cotton exported from the Guntur division almost remained stagnant during the eighties and nineties. As for the local rates of raw cotton in the division either they remained stationary or showed a decline.

As stated earlier we could not obtain a series of data on trade from the official records. What we do get are the occasional sets of a few figures for short periods of three or four years; one has to squeeze inferences from such meagre data.

Grain trade between Krishna district and the Nizam (Hyderabad) state and the other districts of Madras Presidency appears to have been on the increase in the late eighties and early nineties. In the year 1888-89 sea-borne net exports of grain from the Krishna district were a little over 16,000 tons. In the next three years they had gone upto 22,546 tons. Rail-borne net exports through the Nizam's Railway line increased from five tons in 1888-89 to nearly 6,400 tons in 1891-92.

As for traffic on the navigable canals we have some evidence to believe that the grain trade was significant in the district. In the year 1891-92, foodgrains occupied a place of primary importance in terms of quantities and values. In the year 1891-92 foodgrains formed a little over 46 per cent of the total bulk of the up-traffic and 21 per cent in the down-traffic. In 1892-93, of the total quantities, foodgrains formed 48 per cent in the up-traffic and about 37 per cent in the down-traffic. Even in terms of values, foodgrains form-

ed the single largest item of the canal traffic, *viz*, 29 per cent in 1891-92 and 22 per cent in 1892-93. The pattern of canal traffic was not different on the Buckingham canal reaching towards Madras city. Nearly one-fourth of the total quantum of goods transported on this canal were food grains. In terms of values they formed, however, only 16 per cent of the total trade.

In other words, foodgrains increasingly came to occupy an important place in the total trade transacted from the district. It was but an indication that paddy, the so-called subsistence crop, was increasingly grown for the market.

The total value of up-traffic on the Masulipatam canal, (from Masulipatam towards Bezwada) in the year 1890-91 was Rs 18,18,237. Foodgrains formed about 28 per cent of this traffic. But if treasure is excluded from the total value, i e, if only goods transported are taken into consideration, then the value of the traffic comes to Rs 11,47,722.[30] Foodgrains as a proportion of this value formed about 45 per cent. Thus, food grains assumed an important role in the trade towards Bezwada, the major commercial centre in the Eastern portion of the district.

As for the down-traffic it was oil seeds, nuts and oils which had a major share. Excluding the treasure the total value of commodity-flow from Bezwada towards Masulipatam was Rs 21,30,941. Oil seeds, nuts and oils formed as high as 53 per cent of the total value of the commodity flow towards Masulipatam. Oil seeds were mainly grown in the uplands of the district *viz* in Bezwada, Nuzividu and Nandigama taluks of the eastern delta. Understandably this dry land produce was carried to the coastal delta areas like Masulipatam.

In the year 1891-92 foodgrains in the up-traffic and oils and oil seeds in the down-traffic formed major proportions of the total traffic. Foodgrains formed a little over 30 per cent of the total up-traffic and oils and oil seeds formed one-fourth of the total down-traffic. The particulars of treasure were not available for that year. If one excludes the treasures from the values of the traffic both ways, the importance of foodgrains, and oils and oil seeds in the total value of commodity flows would be all the more striking.

## VII

## Credit Market

We have seen in the earlier sections how the dynamism that was injected into the agriculture of the district in the early fifties, with the provision of irrigation, had gradually started yielding results and by the late eighties and nineties the emerging marketable surpluses (especially paddy), improved transport facilities and the rise in grain prices generated a market-consciousness among the forward looking sections of the agricultural community.

An agrarian economy in a period of transition would, more often than not, leave the impact of its stirrings on the credit, land and labour markets. In this section, we try to capture a segment of the credit market, the one for which we have some empirical evidence. In an agrarian economy credit transactions are not always amenable to recording for posteri-

ty. Innumerable transactions escape the official records. Grain loans, short-term hand-loans ("chebadullu"), loans on mortgage of houses, gold and silver could not enter into our analysis. We could cull out some data on land mortgages, value of land, simple mortgages and mortgages with possession, purposes of borrowing loans, sales of land, particulars of buyers, etc. In short 60 per cent of the cases of simple mortgages involving ryotwar landholders and minor inamdars and the lenders were agriculturists. Traders accounted for only about one-fourth of the total number of cases. Even in terms of the extent of land mortgage and its value, the same pattern holds good. In the cases of mortgages with possession, nearly three-fourths of the total number of creditors were agriculturists, and traders accounted only for about 12 per cent of the cases. In terms of the extent of land and its value agriculturists accounted for nearly 67 per cent of the cases. Discharge of other debts (45 to 69 per cent) and marriage and other domestic expenses (21 to 31 per cent) were the major purposes of borrowing money on land mortgage. For the cultivators in the permanently settled estates, agriculturists accounted for about 70 per cent, and traders about 25 per cent of the total creditors. Together these two categories of creditors accounted for 93 to 97 per cent of the total number. Almost the same pattern holds good for the extent of land mortgaged and its value. Again, like in the case of the ryotwar landholders loans were taken mostly for discharge of old debts, marriage and domestic expenses. Mortgages with possession were very few to merit a detailed analysis. For the tenants in the proprietary estates agriculturists advanced loans on mortgage in 50 to 60 per cent of the total borrowings. The traders' share varied from 13 to 23 per cent and the rest by "others". In the group of "others" the contribution of (i) officials and (ii) professionals like lawyers was significant. These two categories together have a share in "others", ranging from 41 to 64 per cent in terms of number and 31 to 95 per cent in terms of acreage. Mortgages with possessions were very few.

We could cull out some information on the particulars of sales and purchases of the right of ryotwar landholders and minor inamdars. It should, however, be admitted that these statistics do not give an idea of the total debt or of the total extent of land which had been permanently or temporarily alienated from the agricultural classes. These data were compiled from information supplied by the registration offices.

> They left out ... cases in which a written instrument dispensed with under section 54 and 59 of the Transfer of the Property Act i e, the cases in which the principal money secured of the value of land sold is less than Rs 100.

Even so, they are useful to know if the land was passing on from the agricultural to the non-agricultural classes. In other words, as a result of the transition in a subsistence economy, whether merchant capital was entering into the land market or the agricultural community as a whole was holding its own. The distinction between agriculturists and traders might be blurred if the substantial cultivators themselves indulged in trade. We have seen in the earlier section that the substantial cultivators tried to establish direct links with the commodity markets. However, they had not become traders or commission agents to any significant extent, although they exhibited considerable shrewdness in exploiting the opportunities in the commodity markets. As stated earlier, Arya Vysyas, the traditional trading community of coastal Andhra had been historically active in the trade of all varieties like grain-trade, trade in provisions, "cash-crops", piece goods, etc. Only in salt, were the Banjaras dominant. Given this traditional role of the Arya Vysyas and the emerging phenomenon of a proud, dynamic and aggressive cultivator sure of himself and his status in the agrarian society, it was unlikely that he would have become a "whole-time trader". After the harvest the cultivator would certainly look around for the best time and market to sell his marketable surplus. In that process he might even try to outwit Komati—the traditional trader. But once the surplus was disposed of, the cultivator would return to his local factional politics, moneylending, consolidation of his power at the village and taluk levels—activities which increase his status in an agrarian society. In other words, we are suggesting that the distinction between the agriculturists and traders can be accepted, by and large, in drawing inferences on land-transfers, through mortgages from one category to the other. To be sure, the evidence presented in the ensuing pages is not exhaustive. Even so, this might throw some clues to the pattern of land transfers.

Table 7 gives information on the purchases and sales of rights of ryotwar landholders and minor inamdars. On average for the three years, voluntary sales of land accounted for over 90 per cent of the total sales. Well over 70 per cent of the total sales of land were by the agriculturists. About 97 per cent of the total sales by the agriculturists were of a voluntary nature.

On an average for the three years, i e, 1893/94 to 1895/96, in about three-fourths of the cases, land was purchased by the agriculturists themselves. The number of cases where traders purchased land did not exceed 10 per cent of the total. Either in terms of average extent of land per sale transaction or per acre land value no single category of buyers appears to be in a relatively advantageous position over the others. Field labourers acquiring land should not be a surprising phenomenon. In the year 1893-94 they appeared to have bought land of low quality for, the per acre value was as low as Rs 2.88. But during the next two years they had bought superior types of land. Understandably, their average extent of land per purchase was relatively the lowest compared to all other categories. Of the 20,964 total land sales during the three years, the number of purchases by field labourers was 655 or formed only 3.12 per cent of the total. However, this phenomenon should not be magnified. We will revert to this point in the succeeding section. A general comment on mortgage and sale transactions is in order. In the Madras Presidency, in the districts which registered agrarian expansion and growth the agriculturists were able to hold their own and also acquire more land. These districts were Visakhapatnam, Godavari, Krishna, Tanjore and Salem. As per the Revenue Current No 6320, dated November 20, 1898, "... in the remaining districts they (agriculturists) lost more or less, the largest amount being in Madura. After this comes Coimbatore."

## VIII

## Land Market

An expanding agrarian economy witnessing growth would, by and large, activate the land market. Unless the economy is troubled by a very sparse population or an absence of an immigration into the region, land prices would increase. This activity in the land market should be all the more striking in a region such as coastal Andhra endowed with irrigation systems from the middle of the 19th century. An expanding market for agricultural produce and a slow but steady improvement in the infrastructure—especially transport—would give an added impetus for the land prices to move up. These propositions bear some relevance to the data provided in Table 8.

The district of Krishna can be broadly divided into two regions (not necessarily mutually exclusive), *viz*, uplands and delta lands. Uplands can be further classified into dry lands, wet lands and garden lands. Each sub-group can be further classified into (i) Alluvial and permanently improved (I and II), (ii) Regar series (III and IV), and (iii) Red and sandy soils. This classification is based on the fertility of the soil. A similar type of classification holds good for the delta lands as well. Table 8 gives information on land prices for 15 years from 1886 onwards.[31]

In view of the economic development discussed in the earlier sections and the fact that the rural credit market was not dominated by the non-agricultural classes, the demand for land amongst the substantial cultivators and the agricultural community in general must have increased over time. Given this background, it is not surprising to find an increase in the land prices of the delta region over a short period of 15 years. True, the data that we could gather does not take into account the fluctuations in the general price level. But the substantial increases in the land prices—especially the wet and garden lands of the delta region—do point out to an increasing demand for land. This, inspite of the fact that density of population in the Krishna district was relatively less than in the neighbouring districts like Godavari and Visakhapatnam. This demand for alluvial and permanently improved land, reflected in the sharp increase in their prices, has to be seen in the light of an increase in the price of foodgrains—especially paddy in the late eighties and nineties of the 19th century. It was on alluvial and permanently improved soils of the delta region that paddy was extensively grown in the district. And with a sharp increase in the price of paddy, coupled with an expanding market facilitated by the advent of rail transport in the early nineties, the demand for paddy-growing, alluvial and permanently improved land was increasing. No wonder, land prices were moving up during this period.

## IX

## Labour Market

It was argued earlier that the growth in agriculture initiated a process of commercialisation in agriculture, and, notwithstanding the handicaps that it encountered, it did leave its impact on the credit and land market. How did the labour market behave? How did the growth process and commercialisation in agriculture affect the lot of the agricultural labour?

It was stated by some authorities like Srinivasa Raghava Iyengar that during the second half of the 19th century agricultural wages had been doubled and a large number of the agricultural labourers acquired lands, becoming *pattadars* (landholders).[32] Since Raghva Iyengar's analysis is relevant only upto 1890, let us concentrate on the period 1850-1890.

The decennial growth rates of population of the district for the first four decades of the second half of the 19th century were, 9.48 per cent,[33] 21.60 per cent, 6.62 per cent, and 19.83 per cent respectively.[34] The growth rate of population was low during the third decade due to the great famine of 1876-78. The significant growth rate of population for the decade ending with 1891 may be attributed to low base of population density, faster rate of agricultural growth and improvement in transport facilities.[35] The 1876-78 famine which had adversely affected the neighbouring districts of Nellore, Visakhapatnam and Ganjam drove a large number of people from these districts into the Godavari and Krishna districts. The irrigated tracts of Krishna and Godavari had to absorb these immigrants, a majority of whom stayed back. In the Krishna district, of the total population of 15,48,480, as many as 5.63 per cent were such immigrants in 1881. This percentage rose to 5.82 by 1891. It is interesting to note that while the growth rate for thirty years ending with 1901 was 48.4 per cent for the entire district, Nuzvid, Gudivada, Tenali, Guntur and Bezwada taluks had registered growth rates of 75.6, 69.6, 57.9 and 49.5 per cent respectively. And these were the taluks most protected by the irrigation system.

Agricultural labourers (male) as a proportion of total male agricultural workers constituted 14.5 per cent in 1871, 23.4 per cent in 1881 and 21.4 per cent in 1891. Thus it is important to note that these proportions rose sharply in the seventies and eighties of the last century.[36]

Information on agricultural wages for the pre-1873 period in the Madras Presidency is quite sketchy and discontinuous. The wage-data that we present (Table 9) refer to the casual labour. Casual labourers were usually paid a higher wage than attached labour. The former were by and large paid in cash and the latter in kind.

As for the pre-seventies, we have some qualitative evidence to show that wages were not increasing. The Board of Revenue after communicating with the Collectors of several districts in 1863, came to the conclusion that "as a rule all agricultural labourers were still paid in grain and that these grain wages had not risen materially during the late years".[37]

The Board made another round of enquiries with the Collectors in the early seventies which yielded the fact that wages in kind paid to farm labourers remained stationary and that the rise in money wages was neutralised by a rapid rise in prices.[38] Thus, it appears that between 1863 and 1872 there was no increase in the real wages of the agricultural labourers in the region.

The daily wage rate for casual/field labour in Krishna district was higher than many of those of the coastal and south-western districts of Andhra (see Table 9). This was perhaps due to two factors. Firstly, as stated earlier, the density of population in the district was comparatively low. Secondly, the expansion of trade, the starting of construction activity (railways, etc) and urbanisation and the emergence of market towns weaned away a section of rural labour thereby retaining their bargaining power. However, the influx of immigrants from the economically backward districts of Visakhapatnam, Ganjam, Nellore, etc, most of whom stayed back in the district, forced the money wages to stay stagnant. For nearly two decades beginning with 1877-78 there was absolutely no upward movement in the wages (see Table 9). On the other hand, given the fact that cash-payment of wages to casual labourers was increasingly replacing kind payments, and that prices of food grains had been increasing in the eighties and nineties we find that the real wages of the agricultural labourers in the Krishna district had been, in fact, deteriorating. This appears to be a paradox in the rural set up. Raghava Iyengar's contention that many of the landless labourers acquired lands and became *Pattadars* appears to be a piece of exaggeration. We have noted earlier (in the Section on the credit market) that there were some cases of labourers buying up some lands. But such cases were few in number. Given the family composition of working members, some savings could accrue to certain families of the attached labourers and such fortunate households may have bought up some lands. Thus, the phenomenon of landless labourers acquiring lands and becoming pattadars could not have been a general feature of the entire labouring class.

The general decline in rural wages from the late seventies with a simultaneous increase in the area under cultivation especially area under paddy—strikes one as apparently illogical. For, with an increase in the area brought under plough, the demand for labour should have been on the increase. An increasing demand for labour and a concurrent fall in wages do not happily fit in, unless there was a spurt in the growth of native agricultural labour, or a large scale immigration into the area from outside the district. We have tried to underline these reasons as important factors in understanding the labour market of the district. The immigration from the neighbouring districts of Nellore, Ganjam, Visakhapatnam, etc, was a powerful factor in blunting the bargaining power of the labourers.

> The Famine of 1876 and 1877 brought in considerable number of poor people from the neighbouring districts who found themselves as field labourers, coolies, palanquin bearers and domestic servants. This rendered labour cheap. Most of them remained here permanently.[39]

As the attached labourers were by and large paid in kind, they were probably protected from the fluctuations in grain prices. But even this system of kind payment did not continue for long. As the economy was increasingly getting monetised, kind payments were giving way to cash payments. This was happening as early as the eighties. Moreover, "paddy or unhusked rice, which in 1850 was returned at Rs 24 per garce (9,860 lbs) is now (1884) was Rs 68."[40] Hence even if one were to concede that (money) wages had been doubled during the period, one finds that the labourer was no better off since prices of foodgrains had increased almost threefold during this period.

## X

## Conclusions

The subsistence farmers of Krishna district exhibited abundant enthusiasm towards irrigation during the late fifties and early sixties of the nineteenth century. However, an inefficient system of water-distribution, the farmers' relative unfamiliarity with water management, and the land turning saline efflorescence dampened their spirit and slowed down the spread of wet (paddy) cultivation in the late sixties.

Rigid water rules prohibiting the farmers from experimenting with crop-mix and a high tax burden—especially a water-tax upto Rs 4 per acre—acted as built-in-disincentives under a colonial regime thereby slowing down agrarian expansion and growth.

Paddy—the "subsistence crop" so called—could transform itself into a "commercial crop" due to the assured irrigation, expanding market, rising prices and improvements in transport facilities from the late eighties and early nineties of the 19th century.

By the mid-seventies the district was able to produce food surpluses, especially paddy. The farmers of the area were eager to sell their produce both within and outside the district. Finding the road and canal transport systems inadequate the enterprising sections of the farmers—especially the Kammas—invested in rice mills and competed with the traditional traders-the Arya Vysyas (Komatis)—in the grian trade at the market towns of Bezwada, Guntur and Tenali. By the early nineties when a rail road was constructed along the east coast connecting Madras and Calcutta, both the Kammas and Komatis became ever more active thereby reaping the fruits of commercialisation in agriculture.

The transition that was taking place in agriculture left its impact also on the credit, land and labour markets. In a period of transition, the agricultural community as a whole appeared to have held its own against the non-agricultural categories like the traders and pure moneylenders. In the credit market the dominant position was held not by the pure traders but by the substantial cultivators who became the beneficiaries of the process of commercialisation. The Komati traders by and large confined themselves to trade transactions in the market towns of coastal Andhra. The rise of the Kammas—a farming community— in the socio-economic and cultural life of present day Andhra Pradesh can be directly attributed to the impact of commercialisation of agriculture in coastal Andhra.

As a result of this growth process and increasing monetisation of the economy, expansion of commodity and credit markets, rise in agricultural prices and improvements in transport, sections of farmers with a land base accumulated cash surpluses thereby activating the land market. As a result of increasing demand for paddy-growing alluvial and permanently improved land, its price had registered a substantial rise during the last one and half decades of the nineteenth century.

Agricultural growth and commercialisation appeared to have by-passed the labourers. In spite of the fact that increase in employment avenues in trade, transport and construction in the emerging market towns of Bezawada, Guntur, Bapatla and Tenali had weaned awav a section of the rural labour force to non-agricultural occupations, the wages of agricultural labourers did not show an upward trend. As a matter of fact, in a growing economy their conditions appeared to have paradoxically deteriorated.

Overall, the transition in the backward agrarian economy under Colonial rule was long, slow and incomplete. The benefits of this limited transition in agriculture accrued to the enterprising, acquisitive and dynamic segments of the landowning cultivators—especially the Kammas—and the shrewd Komatis—traders of the market towns.

## Notes

[This is a condensed version of a paper presented at the Seminar on "Commercialisation in Indian Agriculture" held at the Centre for Development Studies, Trivandrum, in November 1981. The author is grateful to G Parthasarathy for having nursed his initial interest in the agrarian development of Andhra and to A Vaidyanathan and N Chandra Mohan for their detailed comments and sharp criticisms on the earlier draft which were helpful in clarifying certain ideas and strengthening a few arguments. The usual disclaimers follow.]

1 For more details see G N Rao, 'Stagnation and Decay of the Agricultural Economy of Coastal Andhra', *Artha Vijnana*, September, 1978, Vol XX, No 3.

2 Arthur Cotton, who championed the cause of irrigation was the brain behind the Godavari and Krishna anicut systems. The Krishna anicut was built during the period 1852-1855.

3 Letter from Goldingham to J D Bourdillon, Secretary to Government, dated July 9, 1855 quoted in "Report on the Direct and Indirect Effects of Godavari and Krishna Anicuts in Rajahmundry, Masulipatam and Guntur Districts and the Coleroon Anicuts in Tanjore and South Arcot Districts 1852-58". (Hereafter referred to as, "Report on the Direct and Indirect . . .") Madras, published by H Smith, p 156.

4 "Report on the Direct and Indirect . . .", op cit.

5 One anna was equivalent to one-sixteenth part of a Rupee.

6 Gordon Mackenzie, "A Manual of Kistna District", Madras, 1883, p 356.

7 Proceedings of Board of Revenue (Hereafter referred to as PBR), May 8, 1878, pp 4109-22. Table 1 furnishes only a partial picture of the progress of irrigation in the district as the figures relate only to the ryotwari lands.

8 Particulars of land irrigated under the three tenures for the period 1859-1876 have been collected from PBR. But for the subsequent years figures are culled out from the (annual) Reports on the Administration of Madras Presidency. Irrigated lands of the zamindary areas had to be estimated. The ratio of government and inam areas irrigated (put together) to the zamindary areas for the period 1870-72 stood on average at 1.0:0.156. On this basis the zamindary land irrigated has been estimated for the period 1878-1883.

There are apparent discrepancies between the data on 'wet' land in Table 1 and 'land irrigated' in Table 2. In Table 1 area under 'wet' includes lands watered by both the

Krishna, Godavari systems as well as other sources whereas in Table 2 the 'irrigated area' refers only to the land watered by the Krishna system.

9 Letter from Thornhill to the Ag Secretary to the Board of Revenue dated May 26, 1869, PBR, No 89, pp 4667-73.

10 Thornhill, op cit.

11 Ibid.

12 Ibid.

13 Ibid.

14 Ibid.

15 Actually according to one source the water tax was as high as Rs 4.00 per acre. See PBR July 21, 1863, No 205, pp 1540-44. For want of space, details of these data are not furnished in the present article. According to the Board's proceedings the value of the gross produce per acre in wet cultivation (growing paddy) was Rs 24.09. While the land assessment was Rs 3.13 and water tax Rs 4.00, cost of cultivation worked out to be Rs 5.64. In other words, the total expenses borne by the cultivator on an acre of wet land was Rs 12.77 leaving a net profit of Rs 11.32 to the cultivator. Thus, while total tax as a proportion of gross produce was 0.30, total tax as a proportion of net profit was as high as 0.63.

16 Leman's Report dated June 1, 1872, PBR, July 1872, No 1588, pp 3342-46.

17 Particulars of cropping pattern are available only for the ryotwari (government) and inam lands. Quite often the official records are silent on the zamindary areas. Hence inferences had to be drawn from a partial picture of the agrarian setting.

18 For the year 1882-83 area under pulses was not specifically stated in the annual report on the Administration of Madras Presidency. On the basis of data for the preceding and following years area for the year 1882-83 is roughly estimated at 1,00,000 acres.

19 Crop-wise data on non-food crops for the year 1882-83 are not available in the records. Hence for the triennium 1881-82, the averages are only for two years. So is the case with the triennium, 1892-94.

20 The ratio of the irrigated area in the ryotwari and inam areas pur together to the zamindary areas stood at 1.0:0.156 for the period, 1870-72. In other words, for every one acre of irrigated land in the ryotwari and Inam areas there was 0.156 acre of irrigated zamindary areas in the district. Taking this as a proxy for all cereal areas we arrive at an estimate of 2,12,160 acres of cereal area in the zamindary lands for the year 1875. Adding this figure to the total ryotwari and inam areas (i e, 2,12,160 plus 13,60,000) we arrive at an estimate of 15,72,160 acres of cereal area for the year 1875.

21 Large quantities of rice used to be exported from the Krishna delta to Hyderabad, Bellary, Cuddapah and Kurnool. However, the existing road transport system was unable to meet the requirements of trade. The weakness of the road transport system was amply demonstrated by the manner in which the district Collectors repeatedly stressed the need to construct the railway line in the areas. For instance the Collector of Krishna district observed: "A short line of 180 miles over a country without an engineering difficulty would connect the capital of the Deccan with the canal system of the rice-growing deltas of the Godavari and Krishna with the ports of Cocanada and Masulipatam and through them with the whole coast of the Bay of Bengal. It would also connect Bombay in a direct line with the nearest port on the eastern coast". See Thornhill, PBR, May 26, 1869, No 4, 292, pp 4667-73.

22 These data are culled out from the Administration Reports of the Presidency. From 1877 to 1883 the number of bullock carts remained at about 25,000. From 1884-85 onwards one finds a gradual increase in their number from 34,000 to a little over 62,000 by 1889-90. But during the year 1890-91 the number suddenly shrank to 45,700. Part of the reason could be the near famine conditions which set in at the beginning of the 1890s which had depleted livestock as well as marketed surpluses.

23 For instance the Ellore (Eluru) canal, in which a large quantity of water was required, considerable silting used to take place frequently impeding the traffic. Whereas the necessity for keeping sufficient water for heavily laden boats led at times to more water being taken into canals and surplused out, at other times to less water being given out of the canal to its distributaries than was necessary for irrigation.

24 At Seethanagaram cotton would be shipped on a ferry boat which was insufficient for the traffic. When cotton, after waiting for several days to cross the Krishna river, was landed on the other bank, it had again to be carted to the place where it was shipped on the boat bound direct to Cocanada. The Collector complained that constant interruptions in the transit, and the inevitable delays and exposure to rain, were very injurious to the cotton trade.

29 Cited in Washbrook, op cit. Also see his "The Emergence of Provincial Politics, the Madras Presidency, 1870-1920", New Delhi, 1977. See especially Chapter 3 for an excellent comment on the agrarian society of Andhra.

30 For want of space, item-wise breakdown of traffic are not provided in this essay. For more details see G O No 6865 Misc dated November 30, 1891. PBR (Revenue, Settlement, Land Records and Agriculture) October 16, 1891, No 800 I Public Works Department, Irrigation.

31 Parts of Nuzividu, Narasaraopet and Vinukonda taluks consist of the Uplands. The delta lands were spread in seven taluks of the district, *viz*, Nuzividu, Gudivada, Masulipatam, Tenali, Bepatla, Guntur and Bezawada. The land prices of the alluvial and permanently improved varieties of all the three classes of dry, wet and garden lands had increased substantially during the last one and half decades of the 19th century.

35 "Census Report", 1891.

36 However, share of agriculture in total male workers declined from 70.0 per cent in 1871 to 58.5 per cent in 1881 and it made a further slide down to 56.5 per cent by 1891. Concurrently, the share of non-agriculture in the total male workers rose from 30.0 per cent in 1871 to 41.5 per cent in 1881 and to a further rise upto 43.5 per cent in 1891. This should be viewed in the light of an expanding non-agricultural sector like trade, transport and construction indicating the growth of the economy attributable to prosperity in agriculture.

# Technical Assistance Projects and Socio-Economic Change

## Norwegian Intervention in Kerala's Fisheries Development

**John Kurien**

*This paper analyses the impact of a technical assistance project on the socio-economic fabric of Kerala's fish economy. The paper is organised into three sections.*

*The first section deals with the past and the more recent history until the pre-independence era and the initiation of the Indo-Norwegian Project in 1952. This part attempts to portray the overall context and concerns of fisheries development initiatives in Kerala and in the country as a whole. It also provides the background to the dynamics of the establishment of the Indo-Norwegian Project.*

*The second part deals with over three decades of planned fisheries development in Kerala—1950 to 1982—showing the changing approaches to development and the consequences emanating therefrom. It evaluates state policy, the efforts of the Norwegians, the role of the private sector and the larger socio-economic forces in transforming the fish economy and the effects of this on fish workers and fish.*

*The final part of the paper deals with the present crisis in Kerala's fish economy and highlights the questions being raised about it—including the very pointed one about the extent of Norwegian responsibility for the present state of affairs.*

## I

## Initial Conditions, Shaping of Perspectives

THERE is a hoary tradition to the marine fishing industry in Kerala. Though we have no authentic records of the history of periods before the Christian era, there is scattered evidence in the songs of the Sangam Age[1] (1st-4th century AD) and writings of travellers like Pliny who wrote in the first century AD about the immensity of fishery and the importance of the fishing community.

### RESOURCE PLENITUDE

That the waters off the coast of Kerala were plentiful in fish resources have been recorded in later centuries.[2] It is said that the Arab traders found their way to Malabar by following the teeming shoals of oil sardines which migrate down the West Coast of India hugging close to the in-shore waters.[3] More recent periods of European colonial rule in the region saw the systematic documentation of the flora and fauna for the scientific value of ichthyology. Francis Day's "Fishes of Malabar" published in 1865 was one of the kind.[4] The waters off the Travancore region alone, in the 1940s, was calculated to be yielding 254 kg of fish per hectare[5] and "this is double the quantity produced by an acre of water considered to be rich by the fishery experts of the world".[6] This was in spite of the fact that only 15 per cent of the harvestable area was fished.[7] The potential in the remaining area was assessed to field half a million tonnes more of fish.[8]

### DIVERSITY IN TECHNOLOGY AND SKILLS

The conversion of the living marine resource into products with use and exchange value are mediated by the skills of the fishermen and the judicious use of technology. Early references to the methods of fishing and the arts and science related to it are also available.[9] Two striking features of fishing technology are its diversity and the strong element of the exotic. The diversity is largely influenced by the variety and nature of the distribution of fish species and by factors of physical oceanography. The exotic influence is largely due to the adoption of several technological designs from other countries with which the region of Kerala had extensive contact primarily through maritime trade links. The hallmarks of the techniques thus adopted were their appropriateness to the aquatic eco-system and their inherent limits on productivity.[10] It was a technology appropriate for fishing merely as a source of meagre livelihood.

The greatest asset of the fishermen of Kerala is their accumulated knowledge about fish, fish habits, waves, currents and stars which they have, though a tradition of learning by doing, handed down from generation to generation.[11] The whole system of fishing operations—be it shark fishing in Poonthura, *thanguvala* operations in Purakad or the *beppu* fishing in Kozhikode—are not determined *a priori* by a process of inductive reasoning as would be in the case of a modern fishing expedition. Having over time assimilated the nuances of their eco-system by a continuous series of varied but concrete experiences, the progress of their fishing operation is a simultaneous integration of a large number of discrete thought processes which defy verbalisation in the form of any general theory on the practice of fishing.

### EARLY INTEGRATION INTO MARKET ECONOMY

It is therefore evident that the natural resources, skilled labour power and techniques necessary for the development of a viable fish economy have always been present in the Kerala region. In spite of this it would seem that the fishermen were hardly the main beneficiaries of development. The control of the fish economy by persons who dominated the realm of trade was constantly a factor to reckon with. This arises partly from the perishability of fish and the fact that it formed only a small portion of the fishermen's consumption: there were large surpluses available for disposal and trade even at very low levels of productivity. Interactions with the market therefore came at a rather early phase in the development of productive forces. The initial trade/barter activities were perhaps taken up by the wives of fishermen and subsequently, in a caste-based society, by men from other communities who did not consider fish trade a taboo.

### MERCHANTS AND RESPONSES TO THE MARKET

We have evidence to show that the fish economy of the region of Kerala responded effectively to the pulls of the market and adapted its harvesting and processing activities to cater to these demands. This was because of a merchant class who were quick to respond to profit opportunity. However, as we shall note below, the response was often at the expense of the fishermen and the larger social good.

From Travancore and Cochin, following the setting up of coffee plantations in the Western ghat regions, the demand for dried fish among the coolies employed provided a good market. The carriages which brought down coffee from the highlands reconveyed a large amount of dried fish.[12] More important was the opening up of the country by the railways laid by the British in Malabar and Cochin.[13] The dry fish exports from Travancore, where good salt was available, doubled from 26,982 cwts (1,373 tonnes) in 1854 to 54,166 cwts (2,757 tonnes) in 1864.[14] This "export" relates primarily to movement within the Indian sub-continent.

The most interesting example of the overriding response to market demand which is of particular interest in the context of this study is the case of fish oil exports from Malabar.

Oil sardines which even until 1827 were caught primarily for "manuring the rice-fields and coconut trees (because they) were) too fat to salt well",[15] in a span of 30-35 years became the raw material for the thriving fish oil exports from Malabar and Cochin to Great Britain. With the fast depletion of the whale population due to over-fishing, the world supply of fish oil was greatly reduced. Fish oil prices increased and this spurred the search for alternate resources and sources of supply. In the 1830s fish oil export from Malabar was unheard of. In 1845-46 about 66 cwt (34 tonnes) reached London. By 1863-64 the quantity had reached 82,799 cwt (4,214 tonnes) valued at over £ 7,000 per annum compared to around £ 1,270 in 1850-51.[16]

Such a quick response to international demand could only be undertaken with the initiative and drive of a merchant class open and responsive to profit opportunities. The evidence seems to indicate that relatively very little investment and labour was required to extract oil compared with (say) the alternative of salting or drying for local consumption.[17]

### MERCHANT CONTROL OVER FISHERMEN

The question remains: how were unorganised producers made to respond to the dictates of the market through the aegis of merchant capital? The answer lies in the fact that the overriding control of merchants and middlemen was the nexus between credit and marketing of the produce. As reported by the Banking Enquiry Committee of Travancore in 1930 "... once the producer is indebted to the middlemen the tendency is that he is unable independently to market his commodity and the natural results are that he gets less price and has to pay interest on loans. This cuts his small margin of profit clean. One of the witnesses at Quilon informed us that two agents at Quilon mostly control the export trade. They advance all the money required on condition that the catch is sold to them. For every Rs 160 advanced to them they get a promissory note executed for Rs 200. It was said that they never take back the capital, but only the interest which is Rs 40 per annum. The fishermen practically loses his liberty to sell his fish to anyone else".[18] Another source tells us that in 1931 the export of dried fish from Travancore was estimated to yield Rs 40 lakhs, "but the export trade is in the hands of a few rich wholesale merchants who take the lion's share and the poor workers get precious little".[19]

### PRODUCERS' ORGANISATIONS—THEIR FAILURE

Attempts at creating forms of organisations which would give the fishermen greater control over their produce were made in the Travancore region as early as 1917. These organisations were to be registered as co-operatives of fish producers and they were to perform the function of providing credit to redeem fishermen from indebtedness; take control of processing facilities like curing yards; sell their fish collectively and have collectively owned fishing equipment. By 1933 there were 95 co-operatives with a membership of 8,194 covering about a third of the active fishermen.[20] A report[21] evaluating these co-operatives lament their poor performance and points to the lack of support extended by community leaders and the government to the fishermen in their struggle against the merchants and middlemen who have consistently sabotaged the co-operatives.

### PROFITS AND ECOLOGICAL CRISIS

The social and ecological impact of the exploitation of a natural resource solely by the dictates of profit was also a matter that received attention in the last century. Day wondered whether the trend of oil exports will result in "species well adopted for salting ... finding their way into the fish oil boiling pot', .." and further states "... it must be left for future years to demonstrate whether the present increase of this fish-oil is a healthy or an unhealthy stimulus due to present high prices; for if the latter, the fisheries are being overfished and the future loss will be great ..."[22]

We shall see how these initial conditions and the issues mentioned recur in Kerala's fish economy and become matters of live concern to this day. The Norwegians intervened with the intention of initiating change. In hindsight one may conclude that they were largely unaware of these initial conditions and so were deprived of a proper sense of historical and social perspective. This in turn greatly coloured the character of their intervention.

### FISHERY DEVELOPMENT PRIORITIES IN THE STATE OF TRAVANCORE-COCHIN

There is a mistaken notion that the Norwegians entered into a fisheries sector which was stagnating and which received little priority in the development perspectives of the state. In fact the fisheries sector of the early 1950s in Travancore, which was recovering from the post-war phase, was as vibrant as the Norwegian fishery during the first quinquennium of Norwegian independence from Sweden in 1905. While the sector by no means gave the visual impression of being 'modern' it certainly was innovative and dynamic. The basic premise of fisheries development plans in the Travancore region hinged on the judicious exploitation of marine resources by effectively and gradually raising the productive capabilities of the existing facilities giving primacy to the accumulated skills of the fishermen. The thrust was to ensure that technological and scientific research for this purpose be conducted on a "basis of sound commercial principles ... without overlooking the interest of those engaged in the industry and their urgent problems".[23]

The ongoing programmes to facilitate this were many. They included: the supply of wood to fishermen to build their *kattumarams* and canoes and cotton yarn to make their nets; establishment of fishing curing yards under the supervision of fishery officers to ensure a regular supply of good salt and hygienic processing;[24] a programme for phased mechanisation for existing craft amenable to this; tapping new resources beyond the reach of the traditional crafts by using a large trawler to tow indigenous fishing crafts to and from the off-shore fish grounds; the formation of a fishing company called 'West Coast Fisheries Ltd' with government participation to undertake exports and other business; a reorganisation of the co-operatives with fishery officers taking interest in the day to day activities; and the co-operatives themselves being organised to provide the supplies of foodgrains, cloth and other necessities to the fishermen.

Introduction of the latest technology of freezing was attempted as early as 1938 by the installation of a refrigeration plant for preservation and cold storage of fish. Following this it was reported that fish was "made available in the High Ranges and Tamil Country. 95,000 lbs of frozen fish were transported to different parts of South India (last year) though it has to be remembered that the market is shy owing to the comparatively high price of cold-stored fish."[25] There was awareness of the vast marine resources yet to be tapped and also the potentials of the prawn fishery. The author of the Travancore Manual states: "In addition to these different varieties of fish, the invertebrate prawns are found in plenty in our backwaters and the sea and as they occupy a very prominent place among the commercial products from our waters we must not omit to mention them when speaking of the fisheries of Travancore."[26]

In spite of the large number of indigenous initiatives to develop the fishery resources there was a strong opinion in the concerned fishery circles of Travancore that adopting some of the technology of fishing from the developed fishery countries like Britain and Scandinavia would augur well for Travancore. Alluding to the rags to riches fairy tale, the fisheries sector was stated to have the potential of becoming the Cindrella of industries in Travancore.

### PRIORITIES OF THE UNION OF INDIA

The philosophy of fisheries development for the Union of India as a whole was markedly different. Though fisheries was always considered a state subject it was deemed necessary to formulate a national policy on it. An exercise of sorts was conducted in 1946 by the National Planning Committee wherein we see what has emerged as the most dominant school of thought among fishery policy makers in India today. The basic premise of this school is the characterisation of the existing fishery sector as an occupation "largely of a primitive character, carried on by ignorant, unorganised and ill-equipped fishermen. Their techniques are rudimentary, their tackle, elementary, their capital equipment slight and inefficient."[27] This total rejection is followed by a call for the need to adopt modern techniques, the creation of a fisheries bureaucracy and a string of scientific and research institutions to form the basis for modernisation of the sector. Interestingly the representative of the Government of Travancore on the Committee[28] has recorded his dissent note pointing out that the fundamental requirement was to build up the industry from what exists before overburdening it with a plethora of research institutes and administrative machinery at an early stage. That research priorities should evolve from the demands of the existing industry and not be divorced from it was the major thrust of his argument. In hindsight we realise that his views were not taken seriously.

## II

## The Development Decades

In this section, which forms the main substance of the paper, we will attempt to chart out in detail a course covering over three decades—1950 to 1984. We shall try to bring out the various key factors that conditioned the growth and direction of the fish economy of Kerala and weave into this the role played by the INP. We shall follow the pattern of dealing with each decade in a separate part discussing the significant events and changes that occurred therein. Each part will end with a balance sheet taking stock of the "assets and liabilities" of the period.

### *Part I: The Fifties—Initiating Planned Change*

With the euphoria of gaining independence still very much in the air, the enthusiasm for introducing planned socio-economic change in the country was at a very high ebb. With Jawaharlal Nehru at the helm the conviction and commitment to tranform every sector of the economy with the desirable participation of the people was evident among politicians and planners. The institution of the Five Year Plans and the commencement of the Community Development Programme were two indicators of these noble intentions.

For the region that is now called Kerala, the decade of the fifties must be noted for four important events which had a very significant bearing on the fisheries sector. They are: (a) The initiation of the Indo-Norwegian Project idea in 1952, (b) The entry of frozen penaeid prawns as an important item of export, (c) The creation of Kerala State in late 1956 by an amalgamation of the greater parts of the erstwhile State of Travancore-Cochin, and the Malabar district of Madras state, and (d) The coming to power in 1957 of the world's first democratically elected communist government in the state.

The importance of the first two events, we will consider shortly. The two political events occurring in the latter half of the decade and their fishery significance warrants explanation first.

### CREATION OF KERALA STATE AND THE COMMUNIST MINISTRY

The creation of Kerala state in 1956 brought together into one political unit three crucial factors needed for a wholesome development of fisheries for the larger social good: the most productive waters in the Indian sub-continent; the best of skilled fishermen with a wide diversity of techniques and the two most enlightened fishery administrations in the country—that of the State of Travancore-Cochin and Malabar district of Madras state.

With the coming to power of a communist government in August 1957 they highlighted the need to organise the fish producers, raise their productivity and develop fisheries giving primacy to fish as a source of livelihood and food. In doing so they were only reinforcing the orientation of the erstwhile Government of Travancore-Cochin. The Norwegian intervention in the form of the Indo-Norwegian Project for Fisheries Community Development was initiated before the above mentioned political events. But when these events did materialise they had a considerable bearing on the INP. However, as we shall see later, it was the snowballing impact of the first export of frozen prawns to the USA by a private firm and some of the "discoveries" during the INP's activities in the fifties which created what we shall show to be a turning point in the thrust and direction of the fisheries development perspectives of Kerala state.

### THE INDO-NORWEGIAN PROJECT

The Norwegian intervention into Kerala's fish economy has been a target of much discussion and analysis.[29] We will draw from these sources but will attempt to situate the intervention in a perspective which we consider to have been inadequately dealt with by others. The thrust of earlier analysis has often been to seek answers for the "impact" of the intervention at the micro-level within the dynamics of the project area situated in the erstwhile State of Travancore-Cochin. The wavering fortune of the Norwegian intervention are sought to be explained on the basis of the styles and whims of personalities—Norwegian and Indian—associated with the project from time to time. What we shall try is to greatly enlarge this realm and consider the effect that the social and economic forces in the world at large and the region of Kerala had on shaping and determining the "impact" of the Norwegian intervention.

The Norwegian intervention into Kerala came in the form of an Indo-Norwegian Project (INP) for Fisheries Community Development in the States of Travancore-Cochin and took effect in January 1953 following a tripartite agreement signed in New Delhi between the United Nations, the Government of Norway and the Government of India.[30]

The INP was the world's first development project of its kind inspired as a part of the UN Expanded Programme for Technical Assistance which was seen as an avenue for post-war reconstruction and development assistance to the newly independent developing countries. The success of the Marshall Plan in the reconstruction of the war-torn economies of the west was a point of departure for developed economies to extend technical assistance in the form of machinery, aid and expertise to what in those times were referred to as "underdeveloped economies". In Norway under the leadership of the Labour party in power there was a consensus and popular pressure to undertake such technical assistance programmes as an extension of the social democratic solidarity ideal. With this objective the Norwegian Storting (parliament) established the Norwegian Foundation for Assistance to Underdeveloped Countries in the summer of 1952. Apart from the solidarity ideal there were other less noble motives to the establishment of the Foundation.[31]

The Norwegians were undoubtedly purposefully motivated but were inadequately prepared to face the complexities of such a new form of outreach to assist in the development programmes of newly emerging nations. Among the Norwegian Directors of the Foundation there were very few people having knowledge of underdeveloped countries in general and an even smaller number had any knowledge of economic growth problems in them. Apart from India's appeal as a newly independent democratic country and the popular appeal of Gandhi and Nehru, very little else was comprehended by the Norwegians about the problems and needs of development in India; the social, cultural, economic structures through which development was to be achieved; or about the administrative machinery for undertaking the concrete tasks.

The Board Directors of the India Fund (as the Foundation was also called) had a few guidelines given to them before they set out on their mission to India (in late 1952) to identify a project in which they could get involved. The main pressure was to ensure by all means that a supplementary agreement going into the specifics of a technical assistance project be concluded. Priority was to be accorded to food production in a limited rural area.[32] Involvement in industrial development in India's large public sector was ruled out and investment through the private sector was ideologically not suited. The delegation was instructed not to choose a fisheries project.[33] Since the Indian government had not requested for Norwegian assistance there was no *a priori* guarantee of a market for a project suiting Norwegian pre-conditions.

As anticipated there were difficulties in finding an appropriate project. Having moved from Himachal Pradesh to Assam and finally reaching Travancore they had to settle for a fisheries project in the latter area[34] or go back with no project at all. The Indian government was not keen to accept a purely technical assistance programme and were keen to fit the Norwegian offer into the framework of the Community Development Programmes being propagated at that time.[35] The finally stated objectives in the supplementary agreement were:[36]

To bring about:

(a) an increase in the return of fishermen's activity
(b) an efficient distribution of fresh fish and improvement of fish products
(c) an improvement of the health and sanitary conditions of the fishing population and
(d) in general, a higher standard of living for the community in the project area.

These objectives were clearly the result of the process of compromise between Norwegian technical assistance priorities *per se*, the overall philosophy of the Government of India and the development concerns of the Government of Travancore-Cochin.[37]

The Norwegian intervention in India and its involvement in the fisheries sector of Travancore must be seen against this backdrop. The Government of India had nothing to lose by extending a warm welcome to the Norwegians. The Government of Travancore-Cochin on the other hand was open to Norwegian involvement, but only in the fishery sector. The Norwegian delegation accepted the fishery project[38] under the terms that it would be "administered by the Government of Travancore, under the supervision of the Government of India and in consultation with the Representative of the Board of the Norwegian Foundation".[39]

The Indo-Norwegian Project can be treated in two main phases. The first phase is from 1953-1963 when the activities were primarily concentrated in Kerala in the erstwhile Travancore-Cochin region. Within Kerala during this phase the project primarily covered three fishing villages in the district of Quilon with a population of 12,000 in 1952.

The second phase from 1963 to 1972 consisted partly of a continuation of only some of the fishery activities initiated in Kerala and partly an extension of this to two other maritime states of Karnataka and Tamil Nadu.

In this part we will concentrate on the INP's first phase. We shall not go into elaborate details of the particular activities undertaken during this phase since it would be a repetition of ground covered by several authors and is now well known. We will also restrict our discussion to the first two fishery related objectives of the project.

## THE INDO-NORWEGIAN PROJECT: LAUNCHING PROBLEMS

As pointed out earlier, the first supplement to the main agreement signed before the start of the project clearly bore the mark of concern uppermost in the minds of the Travancore fisheries administration. In a context where state finances were very limited, the merits of a pilot project of the type the INP was envisaged to become, were measured to be worth the "risks".[40]

Given the time in history and the pioneering nature of the effort it is but understandable that the INP was confronted with many teething troubles in the initial stages. However, even giving allowance for this we find that the initial years—1953 to 1957—were marked by an inability to launch the programme of action for want of skills and understanding rather than want of facilities and finances.[41]

We must elaborate: The strategy for increasing productivity of the fish harvesting activity spelt out in the agreement states: "to the extent feasible present fishing boats will be supplied with suitable motors" [Clause 1d (i)]. What we see is that in less than six months of the commencement of the INP the Norwegians had reached the conclusion that this was not feasible. It is strange that the local canoe had to be shipped all the way to Norway, fitted with engines, tested in Norwegian fjords and then pronounced to be unsuitable for motorisation in Travancore.[42] A ready made alternative—a smaller flat-keeled boat designed in Norway—was offered. However this alternative never proved superior to the existing traditional canoes and if some fishermen did accept it this was perhaps only because it was given to them to experiment with.[43]

Interestingly in 1954 the dugout canoes in the State of Saurashtra (in north-west India now in Gujarat state) which were similar to the ones available in Quilon, were being very successfully motorised with both inboard and outboard engines.[44]

On the question of processing technologies the first supplement states: "Equipment will be introduced for the extraction of oil and the possibilities of improving curing methods and producing fish meal from waste products will be examined" [Clause 1 d(ii.)] Interestingly we note that the INP did not take up any of this. This neglect is particularly noteworthy considering that there were two fish curing yards established in two INP villages—Neendakara and Puthenthura—by the Travancore Fisheries Department. Here fishermen of the area continued to cure fish during this period. Moreover, this is all the more surprising since Norwegian knowledge on drying and curing fish and the attempts at making a protein concentrate from the entrails of fish was also fairly progressed.[45]

The deviation from the original terms of the agreement is also perceived in the setting up of a Fisheries Section branch office in Cochin in early 1955. Pressure was also exerted by the Norwegians on the Government of India to enter into a second supplementary agreement which would give sanction to the attempts to experiment with shrimp trawling, freezing technology and exports of prawns—all of which were developing in quick strides in the private sector in Travancore-Cochin.

It is our understanding that the most important reason for the stalemate of these early years was the lack of adequate fishery competence on the part of the early Norwegian collaborators and hence their inability to adopt a greater "aquarian rationality" in their overwhelming concern for technical assistance *per se*. We also consider the "resistance" of the Indian counterparts—(especially those from the fishery administration of the erstwhile State of Travancore) as well as their constant insistence on sticking to the letter of the agreement[46] as a response to Norwegian technical assistance being pushed without cognisance of the economic, social and political mlieu in the fishery sector of the state as a whole.

### THE FISH ECONOMY OF KERALA

The fishery realm outside the Indo-Norwegian Project was largely unaffected by the activities that went on within the project area.

With the initiation of the Five Year Plans the fisheries sector also moved into the arena of planned development. The investment made by the State of Travancore-Cochin in fisheries through the hastily prepared First Five Year Plan (1951-55) was a paltry sum of Rs 0.27 million implying that the bulk of the investment made during that period was wholly by the private sector—largely the fishermen themselves aided by the private sources of funds from merchants and moneylenders.

During this First Plan period the average fish production for the region that formed Kerala state was estimated to be around 1,81,000 tonnes. The main economic species were oil sardines and mackerals. All this fish was caught by the artisanal fishermen using their non-mechanised wooden craft and traditional cotton nets or hooks.

The Second Five Year Plan (1955-60) was more thoughtfully planned and the possibility of using Plan expenditures to create an economic environment oriented to certain spelt out goals was attempted.

During this Second Plan the state invested a total of Rs 6 million for fisheries development of which Rs 2.16 million (36 per cent) was spent on production oriented schemes and Rs 3.38 million (56 per cent) on processing and marketing schemes. From the outlay for the production oriented schemes as much as Rs 1.86 million (86 per cent) was spent on providing credit to fishermen through co-operatives and making improvements to the traditional craft and gear (particularly for supplying nylon nets and timber for craft). Of the outlay for processing/marketing schemes, processing facilities for drying and curing and internal market oriented programmes received priority claiming 64 per cent of the funds. The schemes initiated during the period were a continuation of the pre-1950 orientation and were essentially centred around strengthening what we have elsewhere referred to as the traditional sector[47] of the fish economy of the region.

During this plan phase, fisheries development was seen as essentially a programme to increase the productivity and power of the fishermen and through this to enhance the protein supplies to the consumers within the state. Fisheries development was not divorced from fishworkers development or the interest of the avid fish eaters of Kerala.

### THE INDO-NORWEGIAN PROJECT: DRIFTING WITHOUT DIRECTION

Even while the Second Five Year Plan priorities were being systematically implemented, the INP was drifting without direction. On the one hand a commitment to the original objectives had to continue, although the Norwegians had reached an autonomous conclusion that pursuing them was leading to a "dead end". On the other hand there was pressure, primarily from Norway, to make a "success" of the project.

With the motorisation of the traditional crafts abandoned even before it was given rigorous trials, the search for the universally useable beach landing craft also was slowly being dropped.[48] The move to construct larger boats with more powerful engines using completely new fishing techniques was well on the way.

By mid-1957 freezing technology was selected for the processing of the fish to be internally marketed. The fish chosen was oil sardine. Experimental marketing was started but we are told nothing about the economies of it. Judging from the 1938 experience of the Government of Travancore there is reason to think that the consumer resistance and the low purchasing power would not have made it viable.[49]

### ENTER THE PENAEID PRAWN

When the INP had just started functioning in Kerala in 1953, a private merchant took the bold step of exporting 13 tonnes of frozen penaeid prawns to the US.[50] This was followed by a swift increase in demand for frozen prawns from Kerala leading to a quantum increase in exports. By 1957-58 five more firms had joined the fray and between themselves had exported 458 tonnes of frozen prawns to the US. The success of the private entrepreneurs and the inherent interest in a survey of marine resources led in 1956 to a collaboration between the INP and the Centre Marine Fisheries Research Institute (CMFRI) for an assessment of the marine wealth of Kerala. This was perhaps INP's major contribution to the state of knowledge of fisheries. One of the important "discoveries" was that the presently untapped resource of penaeid prawns available off Cochin and Quilon—both in the shallower in-shore waters and the deep sea—made the Kerala waters one of the world's richest prawn grounds.[51]

Spurred by this discovery and the rather rapidly increasing market for prawns in the US,[52] the new technique of bottom trawling for prawns and its experimental freezing was undertaken by the INP in 1958 with the objective of making trial exports to the US. The Indian members on the INP standing Committee[53] were against this INP initiative which they felt was outside the structure of producer control and hence in a sense contrary to the agreement. They urged the creation of a fishermen's sales organisation under whose auspices such ventures could be undertaken. Because of the objection raised the prawns frozen until then were also marketed locally.

### ENCOUNTERING THE FISH MERCHANTS WITH CO-OPERATIVES FROM ABOVE

The comments of the Standing Committee on the need to hasten the creation of a producer based marketing experiment led to the quick formation of autonomous co-operatives Sales Organisation within the area of operation of the INP in Quilon. This Sales Organisation was expected to achieve for the fishermen in Neendakara what similar organisations did for the fishermen of Norway—assure the producer of a higher price for his fish. To fulfil this all the physical facilities—ice plants, freezing plants and insulated vans—were largely placed at the organisation's disposal. The fishermen who had availed of the INP boats were obliged to hand over their catch to the organisation at pre-determined prices rather than to the regular fish merchant of the area with whom they had always transacted business.

The Norwegians apparently under-estimated the power of the local fish merchants. They did not understand the nature of the relationship between fishermen and merchants. They also failed to appreciate the fact that these organisations created *for* the fishermen were unlikely to succeed when compared to the Norwegian Sales Organisations which were created by the Norwegian fishermen, with the assistance of their government, following long drawn struggles against middlemen and merchants.[54]

The local middlemen and big fish merchants scuttled the functioning of the Sales Organisation by out-buying it when the catches were low and withdrawing from the shore when there was a bumper catch. A quick succession of such situations and total chaos prevailed. The autonomy of the organisation really meant nothing so long as the fishermen who were registered as its members hardly felt they had a stake in its successful functioning. Both the fishermen and the merchants knew that the INP would prop up the Organisation in times of crisis. The writ of the merchants prevailed.

### BALANCE SHEET FOR THE DECADE

The close of the decade saw the INP for the first time in the hands of persons from Norway whose fishery expertise was held in high esteem the world over.[55] The change also helped to stall the drift and set right the INP's rudder—*albeit* with the resolve to take a new, more decisive course with changed goals.

The beach landing experiments being undertaken were terminated; the new, larger and more powerful "INP Boats" were being produced in the INP boat yard with an eye to developing shrimp trawling and purse seining; many high visibility demonstrations of their performance were conducted; over 100 local fishermen were trained to use mechanised boats thus raising their level of skills; the co-operative Sales Organisation experiencing rough weather was bestowed with a heavy-investment-low-turnover marketing scheme; the demand for ice had generated sufficiently to get the INP plant to function at full capacity.

A sum of Ṅ kroner 27.8 million (Rs 18.4 million in 1959 prices) was spent on the INP from the time of its inception until the end of 1958.[56] Of this, 42 per cent was spent on Norwegian personnel and project administration; 30 per cent on the fishery section and 28 on the health division. Another way to present the same is that 82 per cent of the expenditure was on Norwegian personnel and capital equipment and the remaining 18 per cent were the expenses incurred in India relating to wage costs; operating expenses, maintenance of the equipment; and some investments in research, human and physical capital.[57]

There was considerable concern about the political consequences of such a large scale of investment restricted to a limited geographic area. The extent of the disparity between the project area and outside is evident from the following: the aid per capita in the project area from its inception until 1958 was Rs 474.00 compared to the per capita community development expenses of the Government of India of around Rs 5.00 in the two administrative divisions (blocks) in which the project area was located.[58]

By the end of the decade fish production in the state as a whole increased to average 2,37,000 tonnes. The entire harvest was a result of the efforts of the artisanal fishermen of the state. They were very favourably aided by mother nature[59] and to a lesser extent by the most significant technological change in Kerala's fisheries—the shift from using cotton to nylon nets.[60] In the INP area of the total fish landing of 2,080 tonnes about 12 per cent (260 tonnes) was contributed by the harvest of the mechanised boats issued by the INP.[61]

In 1957-58 it was estimated[62] that there were 42,039 fishermen households in Kerala state comprised of 269,064 individuals. Between them they operated 8,280 *kattumarams*, 3,173 plank canoes and 8,774 dugout canoes. The combined total of fishing nets was estimated to be 61,560 with over 16,000 hook and line sets. With the active fishermen in the population estimated to be around 66,000 the output per worker was around 4,500 kg per annum. The average household income was estimated to be Rs 542 per annum and the average debt Rs 322.

We may surmise that the basic orientation of both the State of Travancore-Cochin and the State of Kerala under the Communist Government was to have fish produced by the masses for the masses. It was hoped that the two Five Year Plans and the INP would provide the financial resources, the new technology and the organisational framework to facilitate this at higher levels of productivity. However, we note that the decade ends leaving the economy in the throes of a change in approach.

## *Part II: The Sixties—The Export Oriented Approach*

The early sixties heralded in the export oriented approach to fisheries development. All attention focused on the

TABLE 1: EXPORT OF FROZEN SHRIMP/PRAWN FROM INDIA*

* Until 1970 Kerala's share of the quantity of export of frozen shrimp/prawns from India was over 95 per cent. In 1982 it was only 50 per cent.

*Source:* Kerala State Planning Board 1969; MPEPC 1970; MPEDA 1978, 1984.

penaeid prawn! From an export turnover of a little under 500 tonnes of frozen prawns in the end of fifties, by 1961 the figure had reached 1,462 tonnes with an export value realisation of over Rs 4,000 per tonne[63] compared to the internal fresh fish shore price of Rs 150 per tonne.[64]

In 1962 the Japanese were also scouting for prawn supplies as a response to having lost access rights to Mexican waters. That year they imported nine tonnes of prawns from Kerala at the phenomenal price of Rs 8,900 a tonne[65] (see Table 1).

This increased export of prawns by private firms to the US and Japanese market; the confirmed location of economically exploitable, untapped prawn resources off Kerala; the demonstration and introduction of the more catch-efficient technique of bottom trawling[66] by the Norwegians made *both* the Indo-Norwegian Project and the fisheries administration of Kerala devote their undivided attention to the pursuit of prawns.

### THE PRIME AGENTS OF CHANGE

Contrary to popular understanding it is not the INP which is to be considered as the prime agent (sometimes considered 'villain' of change [67] that caused the shift to an export-oriented strategy.

As we had mentioned earlier it was a single pioneer entrepreneur in 1953 and then a couple more who were daring and innovative enough to make the first initiatives to export frozen prawns to the US. By the early sixties, the overpowering signals of the market made a new class of more powerful merchant capitalists (whom the pioneers represented) in Kerala join the 'pink gold' rush. This merchant class has had a history of exhibiting the phenomenal ability to convert any commodity into a medium for profit through circulation.[68] Their entry into the fish economy on a large scale was promoted not only by the strong price impulses in the late fifties and early sixties. It was also a response to crises in the trade in other commodities in which they had been traditionally involved.[69] Prawn was perhaps the first commodity which this merchant class handled where they did not first have to dislodge foreign interests.[70] On the contrary, because of the INP, they were assisted by foreigners!

The INP was caught in this current and played a supportive and demonstrative role by providing the technology for more effective harvesting and processing of the resource.[71] By leasing out its facilities to some of the merchant interests, the INP provided them with an initial "no risks" basis to get a taste of the phenomenon profits in 'pink gold' trade. Having amassed wealth, they soon made their own investments in plant and machinery which in five years (by 1968) was nearly ten times that of the INP.[72]

### THE INDO-NORWEGIAN PROJECT: YEARS OF SUCCESS?

The period 1960 until the close of the INP in 1963 have been characterised as the "turning point" and "success period" of the INP.[73] From years of groping and drifting there seemed to be much action and a definite direction to the course taken.

Our contention here is that: (a) This 'success' was achieved at the cost of a *shift* in the direction of the INP which was largely inconsistent with its original objectives. (b) Social and economic forces external to the project and almost totally outside the control of the Norwegians were responsible for steering the INP along this new direction. Under the pressure of these very same forces the "checks" placed earlier on the INP by the Indian counterparts (particularly those from Kerala state) also vanished. The INP only continued to drift—it was the current that had changed course.[74]

By 1963 the most notable structural change in the project area consequent to the introduction of the new technology of fish harvesting and processing was the creation of a new class of non-operating entrepreneurs or capitalists[75] who owned the means of production and through this opened up avenues for a large migrant labour force recruited from outside the INP area.[76]

The change in the technology and labour process in the realm of fish harvesting and processing taken together with the entry of this new segment of merchant class interests into the fish economy can be considered as the death knell of the fisheries development policy in Kerala which viewed fishing as a source of livelihood and fish as a source of food for local consumption. The Norwegians played the role of chief pall bearers.

### THE INDO-NORWEGIAN PROJECT: A SECOND PHASE

On April 1, 1963 the activities and the physical facilities of the INP in the three villages of Shakthikulangara, Neendakara and Puthenthura were formally handed over to the Government of Kerala.

Following this the Norwegians concentrated on their work around the new concept of "integrated fishery complexes". Three such complexes were set up in Cochin (Kerala state), Karwar (Karnataka) and Mandapam (Tamil Nadu). These were established in centres having facilities for harbour development. "Each fishery complex project envisaged introduction of power vessels to undertake commercial fishing operations. The shore installations comprise(d) ice factory and freezing plant, facilities for processing and marketing of fish and also repair and maintenance facilities for boats."[77]

The complex in Kerala functions under the complete administrative control of the Government of India and is called the Integrated Fisheries Project (IFP). It is an impressive "high-technology fish economy" model within Kerala. The project with a staff strength of 405 undertakes research and survey work and catches fish using its own large vessels, processes it using modern facilities and has its own marketing channels for the sale of the produce. It is however a 'model' which has had little possibility for creating either spread or demonstration effects outside its own walls. Its bureaucratic links with New Delhi and its technology links with Norway are stronger than its contacts with either fishermen's organisations[78] or the fish trade channels in Kerala state.

The style of functioning of the Integrated Fishery Project in Cochin has precluded the possibility of the Norwegian intervention *per se* having a large influence on the dynamics and direction of Kerala's fish economy in the post-1963 period. What little can be attributed to it in this period would only be from the "hang-over" effect of the involvement in the first phase. Considering that the IFP was totally indigenised it would stand to reason that if a pattern of fisheries development encouraged by the Norwegians was continued, the responsibility must now rest totally with the Indian administrators and the local economic interests who continued to support it without question. We would therefore argue that any analysis of trends in Kerala's fish economy in the post-1963 period should be undertaken without assigning a determining role to the Norwegians. This should not however be considered as absolving them of the historic role they played in introducing a sharp dualism in the fisheries sector of Kerala. This dualism and the consequent polarisation in the economy and a marginalisation of the bulk of working fishermen in the state are the hall marks of the two decades following the completion of the Indo-Norwegian Project in Kerala which we will take up for discussion below.

### THE EXPORT ORIENTATION AND KERALA'S FISH ECONOMY

The effect of this overpowering demand-pull for prawns had its repercussions in Kerala's fish economy as a whole. A sector which was relatively outside the mainstream of the economic and social processes in Kerala society was suddenly transformed into a respectable avenue for investment and involvement. The possibilities of a "Modernised" fishery sector emerged quickly breaking down traditional barriers to entry[79] into the sector. The export-oriented thrust that began to get engrained in the sector was blessed by the country's own attempt to boost foreign exchange earnings. The devaluation of the rupee in mid-1966 gave a further boost to the exports of prawns from Kerala.[80]

The prawn export euphoria had its immediate effect on state policy reflected best in the state's plan expenditures during the period 1961-69. Of the total Rs 110 million spent on fisheries development during this period Rs 82.5 million (75 per cent) was spent on production oriented schemes; Rs 54 million of which went for financing mechanised boats equipped primarily to fish for prawns and Rs 20 million for supporting infrastructure and training facilities. As much as Rs 20 million (18 per cent) was used to finance processing and marketing oriented schemes out of which Rs 18 million was directed towards creating facilities and organisations which were explicitly export-oriented or directly facilitating the export drive.

While the above only represents the investment made in the public or co-operative sector, the pace at which the private sector developed was also phenomenal. We have no estimates for the whole of Kerala but the change in the INP area mentioned earlier gives a picture of the trend.[81]

A very simple investment-output comparison for the decade of the sixties shows that for the Rs 92 million spent by the state between 1961-69 for investments directed towards export-oriented fisheries, an export value of Rs 909 million was realised between 1962-69.[82] Compared to this, for the Rs 8 million spent by the state to improve the artisanal fishery methods and augment facilities for internal marketing during the same period (1961-69) the fish harvested by the artisanal fishermen was approximately 2.5 million tonnes valued at Rs 542 million. It is also crucial to note that between 1961-69, of the 237 tonnes of prawns landed as much as 70 per cent were caught by these artisanal fishermen.[83]

State fisheries policy and investment priorities had come to be swept along with the rising tide of the export drive. The new emphasis was to (a) augment the harvesting capacity by providing subsidies for mechanised boats used for trawling and (b) to build up the human and capital investments essential for their operations.

The state's attempts to continue linking the mechanisation programme with the creation of producer's co-operatives was watered down to mere lip service. On paper the mechanised boats were issued only through producer co-operatives or to groups of fishermen. In reality however the co-operatives, whose mere numbers increased rapidly, were dominated by financiers and middlemen and were indeed far away from being genuine fishermen's organisations.[84] Mechanised boats issued by the government were registered in the name of the fishermen but in reality fully controlled by the plethora of financiers and middlemen.[85] The latter had found a new niche in the export drive by mediating between the new semi-proletarianised fishermen and the *nouveau riche* merchant class that had entered the prawn export processing business. They primarily controlled the sale of the produce from the mechanised boats and some went on to establish unorganised prawn peeling sheds after having attained sufficient control over supplies.

The investment in building harbours, breakwaters, guide lights and providing the training for fishermen to operate the mechanised boats was also the exclusive domain of the government.

In essence what we observe is that the more risk prone, capital intensive, low-return investments were made by the state while the realm of the export business came to be largely concentrated in the hands of the private sector. This was a strategy most suited to the new segment of the merchant class in the fisheries sector.

The attempt by the state to maintain a commanding presence in the processing and exporting of prawns by the establishment of a giant corporation—the Kerala Fisheries Corporation (KFC)—to be run along business lines also resulted in utter failure. This was partly due to the inability to run a business venture on bureaucratic

TABLE 2: DISTRIBUTION OF THE VOLUME AND VALUE OF OUTPUT IN KERALA FISHERIES BETWEEN SECTORS AND CLASSES (1969-1980)

| Year | Volume (in thousand tonnes) | Value of Output (in Rs Million)[1] | | | No of Workers[3] | Output Per Worker (Kg) | Per Capita Income of Workers (Rs) | Output Per Worker (Rs) |
|---|---|---|---|---|---|---|---|---|
| | | Total | To Owners[2] | To Workers | | | | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| | | | | **Mechanised Sector** | | | | |
| 1969-70 | 40 | 41.5 | 29.0 | 12.5 | 7,765 | 5,150 | 1,610 | 5,344 |
| 1974-75 | 143 | 322.8 | 226.0 | 96.8 | 11,260 | 12,700 | 8,597 | 28,668 |
| 1979-80 | 115 | 468.4 | 327.9 | 140.5 | 17,500 | 3,880 | 8,029 | 18,737 |
| | | | | **Non-mechanised Sector** | | | | |
| 1969-70 | 303 | 165.5. | 66.2 | 99.3 | 90,660 | 3,340 | 1,095 | 1,826 |

| 1979-80 | 190 | 271.4 | 108.6 | 162.8 | 1,06,625 | 1,780 | 1,527 | 2,545 |

*Notes:* 1 Two year simple average in current prices.

2 In M-Sector it is assumed that owners get 70 per cent of gross earnings. Actually they get 70 per cent of 'divisible earnings' which is gross earnings minus operating costs which are commonly shared. Operating costs account for a sizeable part of M-Sector gross earnings and have varied over time. Hence the figures are on the high side. In the NM-Sector assumed owners get 40 per cent of gross earnings. Here again for the same reason given earlier the figures are on the high side. However operating costs in NM-Sector is a much smaller fraction of gross earnings.

3 From 1971 the total number of 'Ocean, Sea and Coastal Fishermen' ascertained. Total number for prior and subsequent years estimated using 2.3 per cent growth rate of labour force (T). M-Sector workers estimated by multiplying number of boats during the period of five (M). Non-mechanised sector workers are (T) – (M). M-Sector workers likely to be underestimated particularly for 1974-75 and 1979-80 when it is known that as many as 7-8 persons were attached to a boat although on any trip only 5 participated.

lines and partly due to the fact that any step by the KFC to make its presence felt in the market was scuttled by the private trade interests. By the end of 1983 a sum of Rs 44 million[86] had been invested in this juggernaut. In turn its business operation had yielded a loss which was in excess of its total asset value.[87]

### BALANCE SHEET FOR THE DECADE

The implications of the changing emphasis of fisheries development policy on the fish economy and in particular the fishermen is not known to us in detail from primary survey data.

It can be said that two clearly demarcated sub-sectors had been created in the economy—one which now received all the attention of the state and the new enterprising merchant class and another which was left largely to its own survival. The first which we may now refer to as the "modern sector" is made up of the mechanised boats in the realm of production and the more capital intensive and export oriented processing and distribution activities. The latter is what we referred to earlier as the "traditional sector" composed of the non-mechanised crafts and the labour-intensive, internal market oriented distribution and processing activity.

During the decade, fish production averaged 304,700 tonnes. As of 1969-70 the modern sector in fish production activity accounted for landings of 40,000 tonnes of fish/prawns (12 per cent), valued at Rs 41.5 million. It gave direct employment to about 7,800 fishermen. The output per worker in the sector (accounting for eight per cent of the active fishermen in the state) was 5,150 kg and his per capita income (current prices) was Rs 1,600. At the same time the 90,600 fishermen operating non-mechanised craft accounted for 88 per cent of the total fish landing in 1969-70 (303,000 tonnes) valued at Rs 165.5 million. The output per fishermen in this sector was 3,340 kg or 35 per cent below his counterpart on the mechanised boats and his per capita income (current prices) was Rs 1,095[88] (see Table 2).

In brief, the sixties was one marked by a gradual process of polarisation of the economy. The effect of this was to be quickly felt in the subsequent decade.

## *Part III: Seventies and Early Eighties—Growth and Stagnation*

In less than three quinquenium starting from 1970 Kerala's fisheries had witnessed its greatest rise and fall. The decade of the seventies witnessed the highest ever fish landing and prawn landing in Kerala—448,000 tonnes and 84,700 tonnes respectively in 1973—and also experienced the stagnation and sharpest decline in the growth of overall catch. In the post 1974-76 period the decline in fish landing was of the order of six per cent per annum. Oil sardines and mackerals, once the main stay of the fishery plumped to all time low levels. From a peak of 250,000 tonnes in 1968 (oil sardine and mackeral) the combined harvest touched a low of 112,000 tonnes in 1975 and reached a rock bottom of 87,000 tonnes in 1980. Fish production was 279,000 tonnes in 1980—the lowest since 1961 (see Figure 1).

Marine products exports from Kerala on the other hand increased from 22,792 tonnes in 1969 valued at Rs 277 million to 31,637 tonnes in 1979 valued at Rs 1,096 million. Prawns accounted for the highest share of volume and value of export. Kerala's share in the all-India marine exports declined (see Table 1).

### INVESTMENT GROWTH DESPITE STAGNATION OF PRODUCTION

This stagnation and decline in the fish landing becomes more prominent when seen against the background of increased investment of mechanised boats—small trawlers, (for harvesting prawns) and purse-seiners (for harvesting oil sardines). The total number of mechanised boats by 1979-80 was estimated at around 3,500—more than double the number at the beginning of the seventies. The increase in fishing power did not result in a commensurate increase in the fish catch. This picture is made further depressing when we realise that during the decade both the number as well as the fishing assets of the artisanal fishermen also increased significantly. Going by aggregate counts of traditional fishing craft alone the increase was of the order of around 10 per cent from 30,594 in 1972 to 34,112 in 1979. The number of artisanal fishermen increased from around 90,000 to 1,06,000.

The growth of investments in the two sectors have however been prompted by different factors.

### IN THE MODERN SECTOR

In the modern sector it was the spiralling prices of prawns following the increased demand from Japan which lead to the rather anarchic growth of mechanised boats and processing facilities. It was also this that kept most of the units just above breakeven point.

The aftermath of the oil crisis made Japanese fishing in distant waters rather uneconomical and the proclamation of EEZ's made many potential fishing grounds inaccessible to them. The policy of cultivating sources of supply for prawns on a world wide basis was consciously adopted by them. The strategy of gaining entry by out-buying the competitors was frequently resorted to.

From a mere nine tonnes of frozen shrimp from India in 1962 (all of this came from Kerala) the Japanese were importing 5,313 tonnes in 1969 at a unit price of Rs 17,340 per tonne. In 1971 they emerged the principal buyers (replacing the US) by importing 11,575 tonnes at Rs 17,700 per tonne (compared to US rates of Rs 9,100 per tonne) and by 1982 imported 37,713 tonnes at the phenomenal Rs 62,370 per tonne[89] (see Table 1).

For the Kerala merchant exporter, selling to the Japanese meant price and freight advantages and also a higher yield from the wet weight due to the particular Japanese product specification.[90] Further, the Japanese tastes for cuttle-fish and squid—both varieties of cephelopods available off Kerala's waters but which had a restricted internal market—enabled processors to enhance their freezing capacity utilisation. It was only after 1975 that the Japanese began importing these items from Kerala.

As in the sixties, the pattern of state investment priorities continued to reinforce the growth of the private sector. Plan expenditure during the seventies doubled to Rs 209 million of which Rs 57 million was spent for the issue of mechanised boats; Rs 14.4 million for supporting infrastructure development and Rs 4 million for export-oriented investment in marketing and processing.

TABLE 3: VOLUME AND VALUE OF MARINE FISH PRODUCTION IN KERALA

*(Quantity = thousand tonnes; Value = Rs million; Price = Rs/tonne.)*

| Year | Quantity | Index of Quantity | Value | Price | Index of Price |
|---|---|---|---|---|---|
| 1961 | 268 | 100 | 35.0 | 131 | 100 |

| 1982 | 325 | 121 | | | |

*Source:* Kurien 1978a till 1976 threafter own calculation based on quantity figures of CMFRI and price data from Economic Review of Government of Kerala, 1977-1983.

The entry of the big business houses and the multinationals into the marine export trade enhanced the growth of processing facilities[91] and further spurred the growth of the investments in the harvesting of prawns from the in-shore waters in a bid to keep utilisation rates of the processing facility high. A vicious circle had set in and the common property nature of the resource prompted on unchecked and indiscriminate expansion of the fleet.[92] With the increase in the boats the number of fishermen employed in the sector increased more than proportionally.[93] Even if we assume that the old ratio of five to a boat was maintained it meant 17,500 workers. While their physical output dropped from the 1969-70 level of 5,150 kg to 3,880 kg per annum in 1979-80 their per capita income in current prices rose to Rs 8,000 per annum[94] due to the phenomenal rise in prawn prices (see Table 2).

### ...AND THE TRADITIONAL SECTOR

The rationale for increased investment in the traditional sector of production—particularly in gear types—arises both from the increasing numbers of active fishermen and is the result of their response to a fall in their share of the total output. Between 1969-70 and 1979-80 this sector's share of the total output fell from 88 per cent to 62 per cent and the absolute quantity dropped from 303,000 tonnes to 190,000 tonnes. During that period the output per fishermen plunged from 3,340 kg per annum to 1,780 kg—a fall of about 47 per cent. The increasing investment in gear was therefore a means of attempting to possess as many different types so as to maintain their levels of productivity[95] (see Table 2).

The most recent trend which began in 1980 has been the rapid motorisation of all types of traditional crafts with out-board engines. The diminishing inshore resources, lower per capita yields, the urge for speed and the aggressive marketing of

TABLE 4: INDICATORS OF THE QUALITY OF LIFE OF FISHERMEN HOUSEHOLDS IN KERALA AND QUILON DISTRICT

| | Percentage of Active Marine Fishermen to Total Population | Distribution of Income | | | Spread of Social Facilities | | | | Alternate Employment |
|---|---|---|---|---|---|---|---|---|---|
| | | Proportion of | | | The Proportion of Households | | | | Members in Activities Other Than Fishing |
| | | Household with Less Than Rs 500 | Household with More Than Rs 3,000 | Owning House Sites | Living in Katcha or Pucca Hans | Having Houses Electrified | Having Water Available in Ward | Having Separate Latrine Facilities | |

*Source:* Government of Kerala, 1983b.

the Japanese multinationals have made this motorisation phenomenon take the shape of a tidal wave. Along with this also comes the new pressure to develop better beach landing craft.[96]

However, confronted with an absolute fall in the share of the output such measures only prove to be counter productive.[97] At the close of the decade, the per capita annual income of the over 100,000 artisanal fishermen was a mere Rs 1,527 (current prices). In real terms it would be much less than their income a decade ago.

### BALANCE SHEET FOR THE PERIOD

Two of the most striking features of the period are the growing complexity of the economy and the differential impact of the stagnation on the various actors involved in it.

From a scenario with only caste-bound, marginalised actors the stage is now also occupied by a new class of merchant entrepreneurs, Indian big business houses and local units of multinational corporations.

Going on the assumption of one owner-entrepreneur per boat, in the modern sector, the gross earnings per owner, in 1969-70 was Rs 18,670 and it increased to Rs 93,680 in 1979-80. Even allowing for a 50 per cent deduction for variable and fixed costs, the net profits are substantial (see Table 2).

In the processing sector we find that in 1975 there were 99 registered exporting firms—mostly family controlled partnership concerns—accounting for an export turnover of Rs 464 million. Twenty-three of these firms had annual sales of Rs five million and over. They accounted for 79 per cent of the total export turnover from Kerala. By 1982-83 the number of firms increased to 114 and 48 firms which had annual sales of Rs five million and over, cornered 93 per cent of the total export turnover of Rs 1,133 million.[98] Most of the smaller firms which were "set up" by the multinational corporations faced considerable problems when the latter gradually pulled out from Kerala to other states.[99]

The workers on the mechanised boats were much better off than the fishermen using artisanal crafts. However, their income even in current prices had dropped by the end of the decade (see Table 2). Little is documented about the numbers involved in the processing sector. While considerable employment has been generated in this sector it is equally true that most of it is undertaken on a casual, piece-rate basis and largely by young girls.[100]

Average shore prices of fish soared from Rs 549 per tonne in 1969 to Rs 2,990 per tonne in 1982 (see Table 3). The retail prices are generally marked up by 50-150 per cent depending on the location of the market and the species of fish in question.[101] This increase of fish prices is at a more rapid pace than the general price levels and also the price levels of other animal protein sources such as eggs, milk and beef. For the relatively poorer sections of rural Kerala, particularly the agricultural households, this must have had a distinct bearing on their nutritional standards.[102] Among the middle and higher income households there is evidence of a shift to other more readily available and cheaper sources of protein.[103]

The rather deplorable state of the quality of life of fishermen even after 25 years of planned fisheries development and over a decade of phenomenal growth in exports was documented in a survey undertaken for the whole state in 1979.[104] There were 118,801 fishermen households (marine and inland) and 111,420 full-time active marine fishermen. Of the total households only three per cent had incomes above Rs 3,000 per annum and 50 per cent had incomes below Rs 1,000 per annum.[105] It was estimated that about 80 per cent of them own at least their homestead land. About half owned thatched houses, a third have semi-permanent houses (Katcha) and the remainder live in houses constructed of brick. Only 10 per cent have their homes electrified and fewer have separate toilet facilities. Only a third of the total households have drinking water facilities within the ward in which they live[106] (see Table 4).

The stagnation and decline of the decade was not only the breeding ground of squalor and poverty but strong waves of dissent and protest as well.

## III

## Crisis and Questions

The questions being raised about the fish economy of the state today are many. The crucial ones are the same as raised by Francis Day a century ago. The vital difference of course is that the economy is today very deeply engulfed by capitalist forces of development and that the questions are now asked by the fishermen themselves.

Starting with the initiatives of the Norwegians, spurred by the stronger and more compelling market forces that unleased themselves from the early sixties and combined with state patronage for the same, the economy has undergone a very marked technological polarisation. This in turn has not only resulted in a concomitant economic and social polarisation of the type we have attempted to describe above but also an ecological crisis which has jeopardised the future of the whole sector. There have been considerable discussions and debates on whether or not the indiscriminate fishing during the seventies had lead to overfishing of the resources.[107] However the luxury of debates has remained inside the walls of the research organisations while the artisanal fishermen affected by decline in their output and income have taken the matter to the streets.[108]

### THE FISHERMEN'S AGITATION

From 1981 onwards an annual feature in Kerala in the month of May has been the upsurge of the artisanal fishermen demanding for their fundamental rights to a livelihood and guarantee of a sustainable future which will not be jeopardised by social forces which have their eyes on fish resources primarily for making quick profits. An efficient technology controlled by such interests becomes a destructive tool they argue, alluding to what they consider to be the ecological degradation of Kerala's coastal waters due to unregulated and indiscriminate bottom trawling for prawns and excessive purse-seining for oil sardines and mackerals.

While their movement has not been without contradictions[109] the consistent demands of the artisanal fishermen over the years have been a call to:

- proclaim an exclusive economic zone for small scale fishermen
- ban of destructive fishing techniques
- and a systematic regulation and management of the living marine resources of Kerala.

In this context the pioneer role of the INP as a key participant in initiating the prawn rush and the trawler boom have come in for severe criticism by them.[110]

### LESS FISH FOR LOCAL CONSUMPTION

The spiralling prices of fish largely due to its short supply *vis-a-vis* the growing demand in the state has led to questioning the state policy of heavy investments in the harvesting activity which in turn have not yielded fish for food to local consumers. The fact, as we have shown, the period of rapid introduction of mechanised boats in the 1970s was also the phase of a steady decline of fish production (see Table 3). The per capita availability of fish dropped from 15.2 kg in 1956-58 to 9.2 kg in 1982-83.

### PRIVATE VERSUS SOCIAL PROFITABILITY

At the macro-level we see that the heavily state financed mechanisation of fishing has led to raising of productivity. This in turn has ensured a higher level of earnings to the fishermen working on the boats and more obviously a sizeable profit to the capitalists—particularly the boat owners and the merchant exporters. However this predominent pattern of ownership of the boats and the nexus between mechanisation and prawn exports has greatly detracted from the modern sector's potential to become desirable from the stand point of the overall economic and social considerations of Kerala society at large. This is particularly so when viewed from the three important considerations of: providing cheap protein for local consumption; ensuring a more decentralised mode of functioning and greater spread effects with regard to employment generation.[111]

The largely self-financed, non-mechanised artisanal sector in fishing can be highly desirable from the standpoint of its social profitability,[112] but it is unable to provide its incumbents with the required levels of productivity and the socially necessary accumulation to assure them the possibilities of a sustained income even for mere survival.

### NEED FOR NEW PERSPECTIVES

The need for new perspectives and concrete alternative approaches is being very acutely felt today. However fresh initiatives cannot be merely a tinkering with the old approach and framework which has brought us to the present crisis. There is a need to create a future which ensures a development process which is sustainable, just and participatory.

In this paper we will only allude to the areas which we consider to be key to the framework for the future. Our basic premise is that there is need to raise productivity and ensure a fair distribution of the gains. To achieve this it would be necessary to give attention to the following:[113]

(a) Management of the marine resource
(b) Generation of appropriate and appropriable technologies
(c) Use of multiple energy sources
(d) Exercise of greater producer control over the marketing of fish
(e) Search for new employment alternatives for fishermen.[114]

### RESOLVING CONFLICT

The malaise that has infected the fish economy of Kerala has today reached a point of high crisis. In a democratic polity, functioning in the overall capitalistic framework of society, the vote-bank strength and the economic clout of the various interest groups involved must necessarily be carefully balanced.[115] The crisis in fishing in Kerala is also a reflection of the larger socio-economic and political crisis in the state. Hence its resolution also will necessarily involve a political process of give and take. The onus of making hard decisions regarding the future policies for the fisheries sector have been momentarily set aside by instituting expert commissions to examine the questions and suggest remedies.[116] Meanwhile some interest groups have also resorted to legal measures to seek justice.[117]

### ARE THE NORWEGIANS TO BLAME?

A question that has been constantly raised in the recent past both in India and in Norway relates to the extent of Norwegian responsibility for the crisis in Kerala's fish economy. An answer to this would depend on how one understands the dynamics of a bubble on a stream. Given that, we also seem to think it matters whether the question is to be answered by a Norwegian or an Indian.[118]

In our understanding the INP, despite its pioneering nature, must be seen as an intervention which *hastened* rather than *initiated* socio-economic change. Its role was essentially catalytic in the 'chemical process' resulting from the interaction between penaeid prawns and profit potentials the result of which was prosperity for a few and pauperisation for many.

It would therefore follow that Norwegian or no Norwegian, the export orientation in Kerala's fish economy and its concomitant consequences would have developed—probably at a little slower pace and on a more capital intensive basis.

In the post-1963 phase, when the Norwegians had withdrawn into the shell of their Integrated Fishery Project, the active interaction of the prawn hungry Americans and the Japanese, together with the profit hungry Kerala merchant capitalist class unleashed the 'pink gold' rush. If the Norwegians had not by then played the 'catalytic role' of demonstrating the effectiveness of bottom trawling (using relatively small boats) and methods of processing, we are of the opinion that the imperatives of the market would have ensured that the Americans, Japanese or more likely organisations like the Food and Agriculture Organisation (FAO) of the United Nations would have done so.[119] That is, if the merchant capitalist class in Kerala could not rise to the occasion.

In the context of continued assistance for fishery development projects in India by the Norwegians—but now, unlike with the INP, at the request of the Government of India—the responsibility to weed through old experiences to learn new lessons is an essential exercise. It would seem that on the part of the Norwegian aid bureaucracy and the public there is a fresh beginning in this direction.[120] From the Indian part we need a more thorough going introspection which will look into techno-economic, ecological, demographic and socio-political dimensions of our fish economy. Our views on future aid and technical assistance from abroad must develop both from the analysis of the above and the perspectives which emerge about an action programme for a more sustainable, just and participatory fisheries development in Kerala and India.

## Notes

[This paper is a slightly modified version of a presentation made at a seminar on Norwegian Aided Fisheries Development Projects. The seminar was sponsored by the Norwegian Ministry of Development Co-operation/NORAD and held in Lofoten Islands, Norway in March 1985. I am greatly indebted to Rolf Willmann and Mihir Shah for their extensive comments on the initial draft. Errors and omissions are solely my responsibility.]

1 Literature on the Sangam Era says that 'Thamizhagam' (which includes the region that is now Kerala) was divided into five 'Thinais' and one of these—the coastal Thinai—was inhabited by tribes called Parathvars, Velayars, Meenavars and Nulayara whose main occupation was fishing, salt making and pearl collecting.

2 Frair Ororic who sailed down the south west coast of India in 1320 observed "there are fishes in those seas that come swimming . . . in such abundance that for a great distance into the seas nothing can be seen but the back of fishes, which casting themselves on the shore, do suffer men for the space of three daies (days) to come and take on many of them as they please" Quoted in Day: 1865.

3 From a discussion with C C John former fisheries advisor to the State of Travancore-Cochin.

9 *'Valavisu Puranam'* an ancient Malayalam treatise contains several references to the method of fishing in vogue and to the arts and sciences relating to fishing.

10 Catamarams are of either Egyptian and/or Polynesian origin; the high board dugout canoes made by addition of planks stitched to the dugout are purely of Arab influence; the dip nets are of Chinese origin; the boat seine is unmistakably Spanish and the shore seines were first introduced by the

Portuguese. The fact that the nets were 'selective' and the craft were small, placed certain inherent constraints to raising the productivity (output/unit).

11 Mathur, 1978 makes a good starting point of recording the knowledge of the Muslim fishermen of Malabar.

23 C C John fisheries advisor to the State of Travancore-Cochin elaborates this point in a dissent note made by him during a National Planning Committee on Fisheries. See footnote 27 and 28 below.

24 Two such curing yards were established in Neendakara and Puthenthura before the Norwegians started the INP. The curing yards became the main contact point between the fishermen and the fisheries administration. The officer-in-charge called the Petty Yard Officer kept close contact with the fishermen. This post of Petty Yard Officer continues in the Kerala Fishery administration though the curing yard programme was gradually shelved from 1964 and none exist now.

25 Narayanan Thampi, 1942, p 104. The year referred to is 1940.

26 Velu Pillai, 1940, p 435. Prawns were caught by the fishermen. It was an inexpensive item. Most of it was dried and exported to S-E Asian countries and during the glut it was used as manure for coconuts. The local consumption of prawns was not much partly due to the then popular association of stomach disorders and allergies with prawn consumption.

28 C C John represented the Government of Travancore.

29 See Sandven, 1959; Klausen, 1968; Asari, 1969; Galtung, 1969, 1984; Pharo, 1980, 1984; Platteau, 1984.

30 This was the first supplement to the main agreement between the United Nations, Government of Norway and Government of India signed in October 1952 in New York following which a Norwegian delegation visited India and decided to embark on the project in the Southern Indian State of Travancore-Cochin.

31 This observation from Pharo, 1980, who was commissioned in 1976 by the Norwegian Ministry for Development Co-operation to write the history of the INP. It was thought that with an aid project which would promote "peace and stability through economic growth" the foreign policy of the government would acquire a more positive image particularly in the context of the domestic criticism against NATO membership; Pharo: 1984 quotes the main advisor to the Foreign Minister of the time as having recorded in his diary while commenting on the Norwegian Aid Plan to India—"Good plan, it is necessary to give to people something of a positive nature to supplement high defense expenditure".

32 The emphasis on a limited geographic area stems from the need to "see' the change effected by their involvement. For convincing the Norwegian public even through photographs and films it was important to have a direct relationship with a particular area and a fixed set of people.

33 Pharo, 1980 mentions that fisheries was considered to be "too problematical" an area and hence this instruction. However it seems strange that a country which has world reknown for its fishing industry would not have wanted to undertake an aid project in this sector. We would hazard two guesses to solve this riddle. One possibility is that developing a fishery industry of another country was considered a threat to Norwegian fish exports— particularly stock fish exports to countries in Africa. A second possibility, and this seems the more plausible explanation for the *a priori* instruction, is that the Chairman of the Board of Directors of the India Fund H U Sverdrup and the Norwegian Director of Fisheries, Klaus Sunnana were not on the best of terms (Pharo, 1980). Given this, it is understandable that choosing a fishery project in India would compel the Fund to seek advice from the Directorate of Fisheries which would be hardly forthcoming in the context of the strained relationship between Sverdrum and Sunnana.

34 Given that the Norwegians finally settled for a fishery project and in an area that was climate-wise most unsuitable for the Norwegians, only goes to show the extent of political pressure that existed to start an aid project—any project. The reversal of the Board decision not to involve in a fisheries project was probably possible only because Sverdrup himself was a member of the delegation to India.

35 The spirit of the community development programme initiated in October 1952 was at a high ebb. Jawaharlal Nehru was behind it and even the communist and socialist parties in India had no effective critic to offer on its contents. The objectives of community development projects were: (Dube 1960)

- (a) To provide substantial increase in the country's agricultural production and for improvements in the system of communications, rural health and village education.
- (b) To initiate and direct a process of integrated cultural change aimed at transforming the social and economic life of the village.

36 The similarity between these objectives and the community development objectives is obvious.

37 The development concerns of the Government of Travancore had for long centred around more than a mere raising of incomes. Health, education and the improvement in the general quality of life were explicit in the programmes of the government. Today the region of the erstwhile State of Travancore is reputed for its high health and literacy standards despite its relatively low levels of income.

38 As indicated in footnote 34 above the Norwegian's had very little choice but to accept and also largely on the terms dictated to them. Though this may seem strange, it was part of the compromise they had to make in order not to be faced with the politically unacceptable proposition of returning to Norway empty-handed.

39 Clause 2 (a) of the First Supplement to the Main Agreement.

40 The plea of the Norwegians about the need for a concentrated effort in a small area on a pilot basis was accommodated by the Government. Clearly the political palatability was low for such a pilot project loaded with a heavy dose of funds when the area outside remained without any. If the Government agreed to accommodate the INP style of functioning it was at a considerable risk. The calculation was that the payoff in terms of demonstrable results would be substantial. When this was not forthcoming an air of conflict built up.

41 The lack of expertise and skills was most evident in the realm of fisheries! The technology which was transferred—the vessels for example—was unsuitable to the climatic and oceanographic conditions. The Norwegian fishermen who came to the INP also had inadequate knowledge of the fishing grounds, bottom conditions and the behaviour of fish in the tropical waters. This situation did not help to create confidence among the Travancore counterparts.

42 The level of technology and skills needed to undertake this experiment was certainly available in India (see Footnote 44 below).

43 The alternative craft—a 22 ft flat keeled boat with 4-5 HP engines was neither technically nor economically superior to the traditional canoes. Though labour productivity was higher the resultant net income, because of the fuel costs, was much

lower than that of the canoes. Taking the figures given by Asari: 1969, but making corrections to his calculations by separating for income to owners and/or owner-workers and income to crew, we note the following from Table A. It is evident from Table A that the differences in earning of owners was clearly not high enough on the 22 ft boats to warrant a big shift in favour of it. It was a rational decision *not* to accept the new technology. Sixty-seven such boats were however constructed by 1956-57. Fishermen who were given the boats accepted it—some made good and concealed the fact from the INP authorities.

TABLE A: ECONOMICS OF SMALL FISHING CRAFT 1959-62

| | Traditional | | |
|---|---|---|---|
| | Small Canoes | Big Canoes | INP 22 ft Boat |
| Investment (Rs) (1953 prices | 1000 | 2000 | 2000* (subsidised) |
| Average Annual catch (kg) | 8603 | 8010 | 8841 |
| Gross Income (Rs) | 2389 | 3667 | 3643 |
| Net Income (Rs) | 2032 | 3148 | 1883 |
| Crew size | 5 | 10 | 3 or 4 |
| Output/Crew (kg)* | 1720 | 801 | 2210 |
| Workers share (Rs)* | 245 | 190 | 215 |
| Owner's share (Rs)* | 810 | 1260 | 1130 |
| Owner-workers share (Rs)* | 1055 | 1450 | 1345 |

*Note:* * Our calculations based on crew: owner sharing of net income in ratio 60:40 for traditional boats and 40:60 for INP boat.

44 The fact that this was done in Saurashtra and proved to be successful only goes to reinforce the doubt raised with regard to the Norwegian conclusion about the inability to motorise the canoes in Quilon. In fact today the very same canoes of Quilon are being motorised with more powerful outboard engines. However one may contend that even if the Norwegians did show that it was technically feasible to motorise the canoes, given that the prices of fish remained very low, the experiment would have met the same fate as the 22 ft flat bottom boats. In Saurashtra the fact of in-shore pomfret resources and the large demand for them from the Bombay market perhaps in no small measure account for the success of motorisation there.

45 The fact that the INP did not even consider taking up this activity of improving 'traditional' processing in which they had very useful experience casts a cloud of doubt on the purpose of shunning it. It is interesting to note that in the late sixties a nutrition programme among children in Kerala used 'fish powder' which was made from the entrails of fish and imported from Norway as a gift!

46 Particularly the clearly stated objectives.

47 See Kurien, 1978a. Essentially we are referring to the base of a fish economy matrix composed of three activities (columns)—production, processing/marketing and consumption—and three sectors (rows)—traditional, modern and ultra-modern. The traditional sector is at the base. Traditional production refers to the small-scale artisanal fishermen, their equipment and activity; traditional processing and marketing refers to processes such as curing and drying and the labour-intensive marketing network of fish distribution; traditional consumption refer to the consumption by rural and urban poor and the middle-class who form the bulk of the consumers. In brief it is a sector where production by the masses is for consumption by the masses.

48 In the first place the very search for a "universal" beach landing craft was doomed to fail given the very wide variability in sea and surf conditions even across very short stretches of coastline. The Norwegians did not get the opportunity or did not want to appreciate the rationale behind the wide diversity in craft design even within the short coastline length of Travancore.

49 The choice of oil sardine for freezing was in itself inappropriate due to the high oil content of the fish. Sandven, 1959, states that in the monsoon months of 1959, 15 tonnes of frozen fish were sold and in December 12 tonnes of fish were sold. With four insulated vans of eight tonnes capacity per trip this was gross underutilisation and very high costs which certainly could not be borne by the market—not to mention the resistance to frozen fish which continues to this day (see Kurien: 1984c). Compared to this the 1938 experiment of the Government of Travancore was far more successful with much less infrastructure.

50 Given that freezing technology was very new in India and the market for frozen Indian prawns in the 'sophisticated' US market also being a far cry this first step was indeed a bold one. The merchant concerned used the equipment of the West Coast Fisheries Company and also chartered a Japanese trawler for fishing.

51 It is known that there was some controversy as to whether it was the INP or the FAO who "discovered" the new resources of prawns in Kerala's waters. However the controversy was partly resolved by stating that the existance of such a resource was known earlier. Be that as it may, the important point is that in the early 1950s there was a conscious search for prawns by the Americans. International fishery bodies like the FAO followed. The INP resource surveys must also be seen as a part of this larger search (see footnote 52 below). India is today the world's largest producer of penaeid prawns. Kerala contributes about half of the harvest.

52 The demand for prawns in the USA is largely a post-World War II phenomenon. Two factors are responsible for the increased demand for prawn:

a) The war-time shift in the population from inland areas to the coastal regions introduced more people to sea food. Consequently on their return to their homes, the demand for sea food spread to the inland markets. The discovery of large shrimp grounds off Louisana and the establishment of a more efficient transport system and a cold chain gave a boost to the marketing of marine products.

b) The members of the US armed forces in the SE Asian regions developed a taste for SE Asian cusine which is replete with crustaceans (like prawns) and cephelopods (like cuttle fish). With their return home the taste for the exotic sea foods is more engrained and consequently demand increases.

One need hardly emphasise that the post-war prosperity is also responsible for the effective demand—shrimp was a luxury item.

Imports of shrimp into US in the 1930s and 1940s were from China. Following the revolution this supply dried up and alternative sources had to be found. In 1950 the import of shrimp into the US was 18,000 tonnes, in 1959 it reaches 48,000 tonnes and increased to 63,600 tonnes in 1962. US local production was at an all time low of 17,000 tonnes in 1954. Mexico was a prime supplier and had locational advantages but could not cater to the full demand. Supply from India soon followed.

53 The new Standing Committee established in the summer of 1956 was a product of the growing, then open conflict between the Norwegians and the Indians—particularly the 'counterparts' in the Travancore/Kerala Fisheries administration. The initial administrative agreement envisaged that the Government of Travancore would "administer" the project in "consultation" with the Board of the Norwegian Foundation. The Government of India was to play a "supervisory" role. This arrangement proved ineffective for conflict resolution. The 10 member Standing Committee which gave a greater role to the Government of India was expected to achieve this

(Pharo, 1984, p 5). Our reading of the situation is that it was not the committee *per se* but the changed context of priorities in the fisheries sector—particularly its latent export potential perceived in the late 1950s—which made the Government of India more involved and interested in the INP's affairs and to that extent also concerned with reducing conflict.

54 One wonders if the Norwegians really seriously believed that the INP "creating" the Sales Organisation would give "power" to the fishermen to control their produce. If they did then it indicated their lack of awareness of both Norwegian history and social processes. See Vassdal, 1982. If they did not, then having undertaken the task one must hold them responsible for failure. However, all the facets of the failure of the Sales Organisation are not well known but the total lack of participation of the fishermen in creating it is by far the most compelling cause for failure.

55 We take it that the thawing of the cold relationship between the Foundation and the Fisheries Department in Norway took place only after the death of H U Sverdrup. In 1957 G M Gerhardsen who was working with the FAO and was a world famous fishery expert was deputed to the Project first as fisheries leader and subsequently as Project Director. In 1958 and 1959 Trygve Aas and the Director of Fisheries in Norway Klaus Sunnana (who had serious misgivings about the INP when it was conceived) became involved with the project. Only with the coming of these persons can it be said that the fishery competence of the Norwegians outweighed that of the Indians.

56 One Norwegian Kroner = Rs 0.66 at 1959 exchange rates. The calculations were made from the statement of expenditures given in Sandven, 1959.

57 We would include under this head the construction of the sea walls in Neendakara, trial fishing experiments, oceanographic research, training of fishermen and the scholarships to Indians to study in Norway.

58 See Klausen, 1968. The total aid per capita was Rs 632 from which the salary and travel expenses of the Norwegians was Rs 158. This was deducted to give Rs 474.

59 Favourable oceanographic conditions are a very crucial determinant of a successful fishery. This is particularly true for the pelagic species which dominate the fish catch of Kerala.

60 The introduction of nylon for the making of nets was taken up by both the Department of Fisheries and many far sighted social service organisations. A prime example of the latter was the Trivandrum Social Service Society which imported and distributed nylon yarn from Canada.

61 Asari, 1969 Table 9.

62 A census of the whole state's fisheries was conducted by the Department of Fisheries. Unlike most other surveys/censuses that followed in the subsequent years the reliability of this survey is high and hence provides a good bench mark. The figures mentioned, except that of the output per worker, are from that survey.

63 The average export value realisation in 1962 was Rs 4,860. We have therefore assumed the price in 1961 to be over 4,000. The prices at the shore were also increasing rapidly. Calculating from the value received by the sale of prawns catch on INP boats (Sandven, 1959 and Asari, 1969) we note the following prices per tonne of prawns: 1957: Rs 200; 1959: Rs 290; 1962: Rs 560; 1963: Rs 600.

64 This price is the aggregated shore price of all species and hence includes the price of prawns. Retail prices range from 50 to 150 per cent above the shore price.

65 The price dropped the next year to Rs 5,630 per tonne but always remained higher than what was offered by US. It must however be noted that the Japanese always preferred the larger, more costly prawns whereas the Americans were happy even with the smaller varieties.

66 The artisanal fishermen of Kerala have been used to pelagic and mid-water trawling using two-boats. Prawns were caught only during the season when they become pelagic due to the upwelling— mainly the pre-monsoon months. Bottom trawling as a technique was also known to the Indian fishery scientists and was used during experimental fishing. However, it was the Norwegians who demonstrated that it was feasible even with the small 30 and 32 foot boat which they introduced. To that extent they take the credit for making the technique accessible to a broader base of investors.

67 Pharo, 1980 and 1984 talks about the 'entrepreneur' role of the INP. We are inclined to conclude that at best the INP played the "supporters" role assisting the local entrepreneurs—merchant capitalists.

68 The economic history of Kerala is largely the history of a significant merchant capitalist class. The main economic activities in the region revolved around the trade of land-based cash crops to foreign markets. Pepper, cardamom, rubber, timber, tea, coffee, cashew, lemon grass, coir are examples. We have also shown how fish oil became a source of foreign exchange in the late 1800s.

69 The cashew industry which was situated around Quilon was beginning to face a crisis in the early 1960s and the rise of prawn exports came as a great relief to many capitalists who shifted over. As in all such activity there are the pioneers who take great risk and those who join only after being sure of the extent of profits.

70 The colonial rulers with their superior finances and military might supported and defended their merchant entrepreneurs from competition. This however did not prevent the natives from devising numerous ways and means of entering the trade by collaborating and competing with the foreigners.

71 The technology of freezing was available in Kerala before the INP as is evident from its use in 1938 and subsequently in the early 1950s by the handful of private firms exporting frozen shrimp to US. The freezing capacity in Kerala in the 1947-56 period was 54 tonnes. The INP built the most modern facility.

72 (Asari, 1969 Tables 12 and 13) The facilities of the INP taken over by the Department of Fisheries was valued at Rs one million and that of the three firms in the private sector in Quilon at Rs 10.4 million. This was in 1968. In 1963 there was no investment yet made by the private sector—they leased in the INP plant for their use.

73 Pharo, 1980 talks about this juncture in the INP's history at a time when they were on the verge of 'success' but unaware of it. In fact he even says that there was some discussion about winding up the project just prior to this turning point in its history.

74 This historical inevitability is best articulated by Galtung, 1969 when he says "A development pattern may be very different from what one hopes and expects, regardless of intention and capabilities—simply because it is inserted into structures so strong and with a dynamism of their own, that it far exceeds what a handful of good people can muster as defences".

75 It is of great relevance here to note that one of the objections raised by Norwegian fishermen in 1930 to the introduction of trawlers (which were financially outside the reach of the working fishermen) was that it would be the first step to the growth of capitalist relations in fishing. That this happened in Kerala following the Norwegian promotion of trawlers is therefore hardly surprising. It has been mentioned that the trawlers introduced in Kerala were very small compared to what was opposed by the Norwegian fishermen in Norway in 1930. The important point is *not* the absolute size but the fact that in relative terms the scale of difference between the investment required for the existing level of technology and the one to be newly introduced was perhaps the same in Norway and Kerala. It is perhaps of interest to note that trawling operations have never been permitted in Norwegian in-shore waters.

76 Asari, 1969: Table 10 refers to the structural change which was basically the creation of a "Non-operating entrepreneur"

class—or more bluntly a capitalist class—in the project area. He writes: "This welcome change could be wholly attributable to the credit of the INP as it as the only development agency functioning in the area during the period". In 1953 of the 720 fishermen households in the area none belonged to this class. In 1963 the total households increased to 731 and the new class is made up of 20 households. There were also 64 "operating entrepreneurs" of mechanised boats. By the end of 1963 as many as 138 mechanised boats were issued to fishermen. If "operating entrepreneurs" are assumed to work only one boat per head it would mean that the remaining 74 boats were operated by the 20 "non-operating entrepreneurs" of the area. Asari also points out that only 87 of the 138 boats were operated by fishermen "the rest had been disposed of for various reasons". Capitalistic ownership also laid the basis for a proletarianised labour force most of which was recruited from the southern districts of Trivandrum and Kanyakumari.

77 Asari, 1969, p 7.

78 The South Indian Federation of Fishermen Societies (SIFFS)—a federation of genuine fishermen organisations with head quarters in Trivandrum—approached the IFP with a request that they accept shark fins from the sharks caught by their member fishermen since SIFFS had a problem of marketing them. The request was declined since the rules of the IFP did not permit such assistance (Information from SIFFS personnel).

79 Fishing was, and largely continues to be a caste based occupation. Involvement in selling/processing fish was also restricted to a few communities. There was therefore very little 'free' movement of capital or capitalists into the sector prior to the 1950s. Thereafter we see a trickle of entry and soon a tide by the mid 1960s. Undoubtedly it was the phenomenal profit opportunities which broke down the socio-cultural barriers. It was now respectable to talk about "being in the prawn business" whereas the same persons may have shunned the thought of making a living out of selling dried fish. The centralisation of fish landings to two or three major harbours also made the modern sector amenable to easier (absentee) control.

80 The external pressures on India to conform to the "rules of the game" by external funding sources brought about the devaluation and the emphasis on export-orientation. Marine products were ideal export items considering that the foreign component involved in the production and processing was practically nil. The value of exports of frozen prawn alone more than doubled from Rs 41 million to Rs 88 million between 1965 and 1966—the quantity increased only from 7,028 tonnes to 8,784 tonnes. Over 90 per cent of this was from Kerala.

81 See footnote 72 above.

82 The plan expenditure figure of Third Five Year Plan and subsequent three Annual plans are given in Table B. The export figure calculated from MPEPC 1970 is the total value of all marine exports from Kerala.

TABLE B

*(in Rs million)*

| | Third Plan 1961-66 | Annual Plans 1966-69 |
|---|---|---|
| 1 Mechanisation of boats | 11.2 | 42.8 |
| 2 Harbours etc | 8.2 | 8.9 |
| 3 Training of fishermen | 1.2 | 1.6 |
| 4 Export processing and marketing facilities | 6.6 | 5.4 |
| 5 Kerala Fisheries Corporation | — | 6.5 |
| Total | 27.2 | 65.2 |

83 The plan expenditure figure of Third Five Year Plan and subsequent three Annual plans is given in Table C. Quantum and Value of the catch of fish and prawns from Kurien, 1978a.

TABLE C

*(in Rs millions)*

| | Third Plan 1961-66 | Annual Plan 1966-69 |
|---|---|---|
| 1 Traditional craft gear improvements | 1.1 | 1.9 |
| 2 Credit/Grants to village co-operatives | 1.1 | 2.5 |
| 3 Internal marketing schemes | 1.5 | — |
| Total | 3.7 | 4.4 |

84 For a critique on the fishery co-operatives of Kerala see Kurien, 1980.

85 These financiers and middlemen were those who have been traditionally involved in the fish economy. Many of them also combined the role of financier-merchants. The merchants among them were involved largely in fresh fish trade and a smaller number in the export of dried fish and prawns. Only a few of them however moved easily and naturally into the frozen prawn export trade. We therefore notice that there is also a segmentation among the merchant class as a whole. These segments are not only separated by economic and financial barriers alone but also by strong social and cultural factors. The educated economics graduate, financed by a nationalised bank and promoted by a big business house wanting to enter the marine export business, would easily 'become' a merchant-exporter of frozen prawns but never of dried fish even if the margin of profits in the latter were as high. See Kurien, 1978b.

86 Aggregated from State Plan expenditures (see Table D).

87 The Kerala Fisheries Corporation is probably the largest loss making public enterprise in Kerala when considered in this manner.

88 The modern sector brought with it the concept of the "worker fishermen". Getting a share of the net returns (30 per cent divided by the crew of five) we can consider them to be receiving a "variable wage". In the traditional sector fishermen are generally owner-workers, non-owners being considered as "partners". The workers on the mechanised boats were initially all from traditional fishing communities. Their productivity and per capita income have always been higher than their counterparts on non-mechanised craft. For details see Kurien, 1978a.

89 MPEPC, 1970 and MPEDA, 1978 and MPEDA, 1984.

90 The Japanese prefer the prawn headless but with the shell-on. The Americans want a fully peeled and deveined product. The former gives a higher yield from the fresh prawn weight. This factor is also partly responsible for the increased quantum of export of frozen prawns following the large scale buying of the Japanese.

91 For a detailed account of the entry of big business into the marine export trade see Kurien, 1978b. They began their involvement without direct investments in any physical facilities but "promoted" entrepreneurs who were willing to become their agents. Essentially the big business house functioned like merchants. Their involvement became a source of threat to the local merchant class who opposed their entry into the trade. Consequently the Government of India was forced to curb the activities of the big business houses. By the end of the seventies most had

TABLE D

*(in Rs millions)*

|---|---|---|---|---|---|
| Investments and working funds for Kerala Fisheries Corporation | 6.5 | — | 14.3 | 18.9 | 4.4 |

wound up their marine fishing and export activities (see Table E). After 1976 there is hardly any new capacity installed and what exists runs at 20-25 per cent utilisation.

TABLE E

| | Private Sector | Public Sector |
|---|---|---|
| | (Cumulative and in tonnes) | |
| Growth of freezing capacity: | | |
| 1962-66 | 182 | 33 |
| 1967-71 | 386 | 51 |
| 1972-76 | 504 | 356 |
| Growth of frozen storage: | | |
| 1962-66 | 2095 | 805 |
| 1967-71 | 4641 | 1035 |
| 1972-76 | 7613 | 1210 |

92 The growth of mechanised boats was unchecked. There was no process of mandatory registration of boats and hence even a definite count of the number in operation could not be made.

93 The pauperisation of the artisanal fishermen over time provided a "free" work force to operate the mechanised boats far in excess of the required number. Many boat owners could have as many as 8-10 workers "on call". This reduced the bargaining power of the workers and affected their security of tenure. Earnings of workers still remains as a share payment. It is perhaps the overall political environment where the working class have as powerful a "lobby" as the capitalist class which has prevented any change from the sharing system. This in a sense is unique to Kerala's mechanised sector in fishing.

94 This is an inflated estimate since it is not based on the larger number of workers who would have shared the total earnings. Micro level studies show the figure to be around Rs 3,600 in 1980-81 prices. See Kurien and Willmann, 1982.

95 That necessity is the mother of inventions is very true judging from the various gear, tackle and bait innovations made by the artisanal fishermen in the latter half of the decade of the seventies. In the Trivandrum district for example a fisherman must possess or participate in fishing with at least five different gear-types if he is to fish for 300 days of the year. The ownership patterns and sharing systems prevalent allowed this to be attained without all the fishermen owning all the types of gear. With the falling production, control over a greater asset base gives a fisherman a competitive edge over a neighbour who has less.

96 The impact of this trend has not been fully assessed. A recent study (Kurien, 1984a) covers two centres—the INP project area and Vizhinjam fishing harbour in Trivandrum—and studies the changes in productivity and profitability following the introduction of motorisation and new craft designs in the artisanal fisheries sector. It also attempts to highlight some of the aspects that needs to be taken into consideration if the trend continues.

97 Scientists studying tropical water fisheries point out that even at low (individual) levels of productivity an unregulated number of operators fishing the in-shore waters can endanger the stocks.

98 Sebastian Mathew, 'Growth and Dynamics of the Marine Export Industry in Kerala', M Phil Dissertation, Jawaharlal Nehru University, New Delhi (in progress).

99 The operation of the local units of MNCs were strongly resented by the new merchant capitalist class who saw their entry as a threat. The latter were able to muster enough support to get very severe restrictions placed on big business house operations. Consequently many of the business houses shifted their operations to Andhra Pradesh and Orissa where the established merchant interests were not as well entrenched.

100 Very little systematic work has been done in assessing the number of persons involved and the way in which their work conditions have evolved during the decade. Kerala 'exports' to other states in India a large number of young girls who form a sizeable migrant labour population in the other leading marine processing centres in the country. Bombay, Veraval, Puri are places where their numbers are considerable.

101 The further away the retail market from the shore the higher the mark-up. Certain select species such as seerfish and pomfret command a premium in the urban markets. These two species are the only ones generally stocked in the frozen chests of retail food stockists.

102 Fish was the cheapest source of animal protein and in the early 1960s accounted for three-quarters of the animal protein intake of the Kerala population. We have no recent estimates of the intake but it stands to reason that both the above are now facts of history.

103 The shift to milk as a response to its greater availability and the relatively slower increase in prices has been observed. See Nair 1978. At family level the middle class parent gets a child accustomed to milk and eggs, and fish is served occasionally. This is in part response to the higher prices of fish and the scarcity of good quality of fish.

104 This survey was undertaken by the Department of Fisheries of Kerala State in 1979. After the survey undertaken by the Department in 1957-58 this is the only other comprehensive survey of socio-economic conditions undertaken so far.

It is a widely accepted fact by social organisers, bureaucrats and politicians that the fishermen of Kerala still belong to the most economically and socially backward section of the state's population. Yet, as has been pointed out, there are few other sections in the state whose labour contributes Rs three million every day to the country's foreign exchange earnings.

105 The income figures speak for themselves but the picture is made worse when one juxtaposes the level of indebtedness over it. See Platteau *et al* 1981 for a graphic and analytical account of the level of credit and indebtedness among fishermen in south Kerala including the INP area.

106 It must be pointed out that the survey indicates the quality of life of the fishermen of Quilon—as judged from their housing standards, toilet facilities and access to water—to be higher than that of other maritime districts of Kerala. The prime reason for this is the headstart they had in these respects due to the health and sanitation work undertaken by the INP. It is also true that the income distribution is less dispersed than the state average and relatively more households have incomes above Rs 3,000. The concentration of the mechanised sector's operations in the region is the main explanatory factor.

107 The scientific community has not taken a very consistent position on this question. The biologists of the Central Marine Fisheries Research Institute however are willing to state that given the evidence available to them there is "economic overfishing" of some resources but not "biological overfishing". The unfortunate fact is that by the time the 'evidence' is available it may be too late for the fishery.

108 The artisanal fishermen's agitation is at once both an ecology movement and a social movement. The most powerful trade union is an independent, non-political party union (a rare phenomenon in Kerala) in which are also involved many social activists—some of whom are priests and nuns. As a consequence of this there has been a tendency particularly with the press and the politicians to discuss the ecclesiastical issues involved and side track the crucial ichthyological matters. The agitational style of the union and the massive turnouts to demonstrations have forced both left and right governments in the course of the last three years to concede in principle to the need to protect the rights of the artisanal fishermen. For more details see Kurien 1984b also Kurien and Mathew 1982.

109 By posing the questions about the operation of trawlers, the artisanal fishermen not only alienate the capitalist owners but also the workers on the mechanised boats

who from the point of a class analysis are actually their allies. The inability to "fight trawlers" without "fighting the fishermen workers on board" has been a source of constant contradiction for the artisanal fishermen. This is particularly crucial when they opt for a physical confrontation at sea. The capitalist owners of the trawlers use this contradiction to their advantage.

110 This is not only in Kerala but also among the fishermen in other states. See letters to R Brusletten, Royal Ministry of Department, Norway from the Secretary of the Goenchea Ramponkarancho Ekvott in Goa on the subject 'Norad Fisheries Programme in India Not in the Interest of Fishermen'.

111 Taking the average production of the two sectors for the period 1971-76 and considering their pattern of production we have calculated the following (Kurien, 1978a) Table F.

TABLE F

| | Mechanised Sector | Non-Mechanised Sector |
|---|---|---|
| 1 Contribution to protein consumption of consumers in the state (in gms/capita/day | 1.16 | 7.02 |
| 2 Employment generated in the forward linkage of activities (in millions of person-days | 4.33 | 16.30 |

As regards the spatial distribution of the activity, the mechanised sector is concentrated to 10 all-season centres along the 590 kilometre coastline; the non-mechanised sector has a landing centre every 2¼ kilometre of coastline. The concern for a dispersed settlement and production pattern in fisheries is as much an issue in Kerala as it is in Norway. See Hannesson 1982.

112 Social profitability can include measures mentioned in footnote 111 above and also such measures as value added per unit of investment and catch per unit of energy consumed. On all these counts the artisanal sector is more socially desirable.

113 For a more detailed discussion of this see Kurien 1984d.

114 With the fishermen population increasing at a rate of 2.3 per cent per annum compared to the state average of 1.9 per cent the possibility of finding employment for all within the fisheries sector is rather bleak. Even today we have a situation of too many fishermen chasing too few fish.

115 The best example of maintaining the balance was the promulgation of a Marine Regulation Act to appease the artisanal fishermen and consequently to be rather lax in implementing it thus allowing the *status quo* to be maintained.

116 Between 1981 and 1984 two high powered commissions were constituted to look into the scientific and social dimensions of the fishermen's demands and recommend to the government the guidelines for policy making. The Babu Paul Commission, constituted after the fishermen's agitation in 1981, submitted its report with five out of six fishermen representatives submitting a long dissent note. (The representative of the ruling Cong(I) fishermen's union sided with the majority). This commission had 13 members (including the Chairman) of whom seven were officials and scientists. Two of them never attended any of the meetings. On the day of submission of the final report one sent a letter endorsing the commission's views; the other was brought from his office to sign it thus avoiding what may have turned out to be an embarrassing situation for the government. The Kalwar Commission appointed after the 1984 agitation had not submitted its report at the time of writing (April 1985).

117 The Purse-seine Fishing Boat Owners' Association moved the Kerala High Court on the grounds that the exclusion of pruse-seiners from some areas of the sea tantamounts to a violation of the owners fundamental rights to a livelihood guaranteed under the Constitution of India. The court awarded a verdict favourable to them on some "technical grounds" relating to the manner in which the government's notification of the exclusion was made.

118 To the older generation of Norwegians the INP or the "Kerala Project" is very much a part of their mental matrix considering the tremendous public involvement in the 1950s for collecting funds for the project as well as reading, seeing and reacting to its progress. The discussions and writings on the Norwegian role in Kerala, by Norwegians, therefore tends to have more than a tinge of emotion associated with it whether the evaluation is positive or negative. Galtung 1984 is a good example.

119 The FAO was very much involved in the fisheries sector of India in the decade of the fifties. Their involvement in Kerala was at a lower key precisely because the Norwegians were around. However the approach of the FAO was distinctly different. They believed in testing out several prototypes and would leave the commercial applicability to others. Long concentrated involvement in one area as with the Norwegians would hardly be the style of the FAO. The first exporter of prawns from Kerala used a Japanese manufactured trawler of much larger size than those popularised subsequently by the Norwegians.

120 A seminar organised by the Norwegian Ministry for Development Co-operation in March 1985 to discuss the Norwegian aided fishery development projects in India, Tanzania and Kenya was evidence of a rare show of openness to criticism and a willingness to learn lessons from mistakes.

APPOINTMENTS

**Institute of Economic Growth**

University Enclave,
Delhi - 7.

Applications are invited for temporary vacancy of a Professor in the scale of pay of Rs. 1,500-2,500. Candidates with Ph.D. in Economics/ Econometrics and substantial published work of high quality in Applied Econometrics in any one of the areas of money, trade, income and employment and experience of guiding research at doctoral level *or* an outstanding scholar with established reputation who has made significant contributions to knowledge in any one of the above areas may apply.

It will be open to the Institute to consider the names of suitable candidates who may not have applied for the post.

Applications with curriculum vitae should reach the Director by 31st July, 1985.

DIRECTOR
12.6.1985

This is particularly so in the context of increasing sentiments against aid to developing countries both by the extreme right and left political formations in Norway.

Organizational Environments

**Ritual and Rationality**

"Meyer and Scott make a strong case for their environmental explanation of the birth and structure of formal organisations . . . Their theory's greatest value lies in its promise to generate new ideas and new work in such related areas as political sociology, social change, and social psychology." (*Choice*)

Over the past decade, Meyer, Scott, and other leading proponents of the "environmental" view of organisations have persuaded researchers to put more stress on organisational environments . . . and less on the technical aspects of work activities. The authors argue that the nature of an organization is inextricably linked to both its physical and symbolic environment.

# White Revolution in India: Facts and Issues

**K N Nair**

*This paper highlights the trend and sources of growth of milk production in recent years and analyses the underlying factors. It discusses the changes in the quantum and quality of feed supply, and the conversion efficiency of milch animal herd due to variations in species and breed composition and the role of Operation Flood. Such an exercise, it is hoped, will provide some insights into some of the major constraints on increasing milk production in India against the background of the much debated Operation Flood strategy.*

## I

## Trends in Milk Production

ANNUAL estimates of milk production are available from the Ministry of Agriculture. Before looking at the trends in milk production as reflected in these estimates, we shall summarise its main limitations.[1]

The average annual milk production is estimated by making use of the following formula:

$$M = B \times P_m \times Y_m \times 365$$

Where

$M$ = average annual milk production
$B$ = Number of milch animals used for breeding and milk production
$P_m$ = Percentage of animals in milk
$Y_m$ = Average daily milk yield per animal in milk.

The estimates of milk production are made separately for cows and she-buffaloes.

While data on the population of milch animals used for breeding and milk production and the proportion of animals in milk are available for the past several decades, from the five-yearly Livestock Census Reports, data on productivity of milch animals are available for the various animal husbandry tracts of the country only for the period beginning the sixties.

In order to obtain estimates of milk production, the Market Intelligence unit of the Directorate of Economics and Statistics, in consultation with the State Animal Husbandry Departments, used to conduct enquiries in selected milksheds in various animal husbandry regions and arrive at estimates of the productivity of the milch animal stock. Upto the mid-sixties, in the formula cited earlier, the yield per milch animal was obtained like this. Since the yield data were not based on any statistical survey, the estimates of milk production obtained were only rough approximations.

The need to obtain reliable estimates of milk production in the country began to be increasingly felt right from the inception of national planning. In order to obtain such reliable estimates scientifically designed sample surveys were begun by the Institute of Agricultural Research Statistics at the instance of the Ministry of Agriculture. These surveys which began in the late fifties were carried out in different years in different states, and collected information on yield per animal in milk by species, the utilisation of milk among producer households, and the bovine feeding and management practices.[2] By 1966-77 when these surveys had already covered 12 states in the country, the IARS had perfected the methodology for conducting random sample surveys for estimating milk production with a high level of reliability. However the Ministry of Agriculture did not do the surveys on an annual basis till 1977-78. Nevertheless, they arrived at annual estimates of the productivity of milch animals, by making adjustments, to the IARS Sample survey data, for changes in various factors affecting the productivity of milch animals in consultation with the State Animal Husbandry and Dairy Development Departments. Thus, though the sample surveys conducted by the IARS in the sixties gave more reliable information on the levels of productivity of milch animals, they did not result in significant improvements in the reliability of estimates of milk production. The estimates of milk production made by the Ministry of Agriculture during the period 1966-76 were data obtained from earlier sample surveys adjusted to specific later years by the official agencies on the basis of their 'informed' guesses on changes in the productivity of the stock. Since the seventies were characterised by large scale public investment in dairying and milk production, there is, in fact, a chance that the official agencies might have overestimated the production figures in order to show better performance of the sector.

However, the Ministry of Agriculture launched a scheme of annual integrated milk production survey using the methodology suggested by the IARS, from 1977-78 onwards. Only 14 states participated in these surveys. Data on the productivity of the milch animal stock, feed intake, etc, were collected through these surveys. Unfortunately most of the information collected through these surveys are not available. The only estimate published so far is on the total production of milk.

As is evident from the foregoing discussion, the annual estimates of milk production released by the Ministry of Agriculture have several shortcomings; they are not comparable over time; they do not cover all states; and they are published with inordinate time lag. In spite of such limitations, we had to depend for our analysis, heavily on these estimates since there exist no other sources of information available to evaluate trends in milk production. We have supplemented these data with estimates prepared at the state level, for those states which did not participate in the all-India survey. The estimated milk production from 1961 onwards is given in Table 1.

During the early sixties, the estimated milk production in the country was about 20 million tonnes and it increased to 23 million tonnes by 1974. During the subsequent period (1974-82) it increased to 33 million tonnes. In other words, milk production which had been increasing roughly at one per cent per annum during the first period jumped to about four per cent during the subsequent period. Thus if we go by official data India has had a significant breakthrough in milk production. Whether this has in fact been the case can be discussed meaningfully only after examining the sources of growth in milk production.

## II

## Sources of Growth in Milk Production

In the early sixties about 43 per cent of the total milk production in the country was from cows, about 55 per cent from she-buffaloes and the remaining two per cent from goats. Over the years, the contribution of she-buffaloes in total milk production has slightly increased from 54 per cent in 1961 to 60 per cent by 1982. The share of cow milk production declined from 43 per cent in 1961 to 35 per cent by 1982. Since 95 per cent of the milk production is from bovine sources, in the rest of our analysis, we shall examine only sources of growth in cow and buffalo milk production.

There are two sources of growth in milk production: increase in the population of milch animals and increase in productivity per milch animal. Table 2 gives values of these variables for cows and she-buffaloes. These values are quinquennial estimates and since there is all probability of annual fluctuations in yield per animal in mik and the proportion of animals in milk, these estimates may not fully capture the actual trend. However they provide us some rough idea of the direction in which the values of these variables have been moving over time. As it is evident from Table 2, the yield per milch cow remained almost unchanged during the sixties and has shown an increasing trend during the seventies. In the case of she-buffaloes, the yield showed a decline during the sixties and an increasing trend in subsequent years. The populations of cows and she-buffaloes showed increasing trends, the latter increasing at a faster rate.

In order to decompose the growth in milk production into its component elements we have made use of the following equation.[3]

$$(O_2 - O_1) = Y_1(P_2 - P_1) + P_1(Y_2 - Y_1) + (P_2 - P_1 (Y_2 - Y_1)$$

Where

$O_2$ = level of milk production in the terminal year

$O_1$ = level of milk production in the base year

$P_2$ = population of milch animals in the terminal year

$P_1$ = population of milch animals in the base year

$Y_2$ = yield per milch animal in the terminal year

$Y_1$ = yield per milch animal in the base year.

TABLE 1: PRODUCTION OF MILK ($10^6$ TONNES) IN INDIA (1961-82)

| Year | Cow | She-buffalo | Total* |
|---|---|---|---|
| 1961 | 8.75 | 11.08 | 20.38 |
| 1966 | 8.91 | 11.87 | 19.36 |
| 1972 | 9.45 | 12.37 | 22.50 |
| 1974 | 9.74 | 12.76 | 23.20 |
| 1978 | 10.98 | 16.79 | 28.35 |
| 1981 | 11.10 | 18.11 | 31.50 |
| 1982 | NA | NA | 33.0 |

*Note:* * Includes goat milk also.

*Source:* Government of India, Ministry of Agriculture, New Delhi.

The first term on the right side of the equation gives the contribution of increase in milch animal population to increase in milk production. The second term shows the contribution of increase in milk yield and the third term the contribution of the inter-action between increase in milch animal population and increase in yield to increase in milk production. The contributions of these factors to increase in milk production during the sixties and the seventies are given in Table 3. During the sixties, the growth in production was mostly due to increase in the population of milch animals. But during the seventies it has been largely due to increase in the productivity of the stock.

There are several factors which must have contributed to the increase in productivity of the milch animal herd. In our analysis we confine to the important factors operating from the production side. These factors include (a) increase in the quantum and quality of feed, and (b) changes in the conversion efficiency of the milch animal herd. In this process, we shall also touch upon the role played by Operation Flood project.

TABLE 2: ESTIMATED PRODUCTIVITY (KG/YEAR) OF MILCH ANIMALS IN INDIA

| | 1961 | 1972 | 1977 | 1982 |
|---|---|---|---|---|
| Yield/milch cow | 192.0 | 195.0 | 221.0 | 230.0 |
| Yield/milch buffalo | 504.0 | 469.1 | 587.0 | 635.0 |
| Population of milch cow ($10^6$) | 45.6 | 48.4 | 49.5 | 50.5 |
| Population of milch buffalo ($10^6$) | 21.9 | 26.3 | 28.5 | 30.5 |

*Source:* The populations of milch animals for 1961,1977 are taken from the Livestock Census Reports. The figure for 1982 is an estimate based on 1972-77 growth in population.

TABLE 3: PERCENTAGE CONTRIBUTION OF INCREASE IN MILCH ANIMAL POPULATION, INCREASE IN PRODUCTIVITY AND THE INTERACTION BETWEEN YIELD AND POPULATION TO GROWTH IN MILK PRODUCTION

| | Period I (1961-72) | | Period II (1972-82) | |
|---|---|---|---|---|
| | Cow | She-buffalo | Cow | She-buffaló |
| 1 Percentage contribution of milch animal population | 71.0 | 169.3 | 36.4 | 28.2 |
| 2 Percentage contribution of milk yield | 17.0 | −58.0 | 61.3 | 61.8 |
| 3 Interaction between yield and population | 12.0 | −11.30 | 2.3 | 10.0 |

## III

## Changes in Feed Supply

Unlike in the case of human food consumption we have no sample survey data to examine the changes in the feed consumed by livestock population. The only way out in this situation is to construct annual feed balance sheets and see how the overall feed availability has been changing over time. With this objective in mind, we estimated the trends in feed supply in India during the last two decades (see Table 4). While interpreting these estimates it is important to keep in mind the following:

(a) In our estimates of feed supply, we have assumed that the increase in feed supply over the last two decades due to increase in the area and productivity of grasslands and that of cultivated green fodder has been insignificant. The quantity of grass consumed by livestock directly by grazing or by harvesting and then feeding livestock, is difficult to estimate as the growth of grass and its accessibility for grazing and harvesting vary from place to place and from season to season. It is possible to make some ad hoc estimates, but it is of little use, since there has been no qualitative improvement in grazing land and the area of grazing land has been declining at a slow rate. In the case of cultivated green fodder, the area has been remaining at 6 to 7 million hectares during the last two decades with very little increase in productivity.[4]

(b) The main source of growth in feed supply in India during the past two decades has been the increase in crop production, especially of foodgrains and oilseeds. The estimates of feed availability from these sources are derived by the following method: (1) Estimates of roughages are obtained by applying the straw-grain ratio to the estimated production of crops;[5] (2) Similarly estimates of rice, wheat and other allied bran are obtained by applying the ratio of bran to grain; (3) The production of oilcake is arrived at by applying the oilcake content of the crushed nuts after taking into account the proportion going to seed, direct consumption, etc. To arrive at the net availability of oilcakes, we have deducted the annual export of oilcakes from its annual production; (4) Following the National Commission on Agriculture we have assumed that about two per cent of the coarse grain produced in the country is used for cattle feed.

The data on production of principal crops are taken from the annual crop estimates published by the Ministry of Agriculture. In order to obtain a more reliable idea of the long term trend in feed supply we have taken quinquennial averages of crop output for estimating the availability of roughages and concentrates. The qualitative changes taking place to feed supply are brought out by converting it into Total Digestible Nutrients (TDN) and Digestible Crude Protein (DCP).

Before looking at the estimated trends in feed supply it is important to see how the available feed is allocated between bovines and other types of livestock. According to the sample surveys conducted by Amble, *et al*, in the mid-sixties almost all the dry fodder was consumed by bovines. But in the case of concentrates, poultry, pig and goats also consumed a part. According to estimates, by Amble, *et al*, about 12 per cent of the total concentrate feed consumed by livestock was accounted by these species. We have no data to check whether the relative claims of bovines and other livestock on the available concentrate supply has been changing over time. However, given the fact that compared to the bovine sector, the other livestock sector constitutes only a tiny fraction, it is reasonable to assume that the allocation of concentrate feed between the two must have remained unchanged over time. Thus in the subsequent discussion to bring out the implication of the increasing feed supply on milk production, we have not done any adjustment in the concentrate supply to obtain the bovine feed availability. While our estimates of the feed available for bovinestock may therefore be on the high side, they may not distort the trends over time.

The estimated availability of roughages which was about 270 million tonnes in the early sixties increased to 385 million tonnes by the late seventies. During the same period, the supply of concentrate feed increased from 12 million tonnes to about 18 million tonnes. It is important to note that the supply of roughages and concentrates showed a significant increase from the mid-seventies onwards. The total availability of TDN was 120 million tonnes in the early sixties and increased to slightly over 170 million tonnes by the late seventies. The supply of DCP has more than doubled; from 1.60 million tonnes to 3.24 million tonnes. Further the ratio of TDN to DCP has shown a declining trend in the seventies indicating qualitative improvement in feed supply.

Along with the increase in quantum and quality of feed supply the availability of feed per bovinestock has shown an increasing trend. The availability of TDN increased from 526 kg in the early sixties to 720 kgs in the early seventies. The corresponding increase in DCP was from 7 kg to 14 kg. In other words, the phenomenon of declining productivity of bovine population due to decline in per capita feed availability that had been in operation in India's bovine economy has been broken in recent years. Because of the faster rate of growth in agricultural output, the availability of bovine feed has been increasing at a more rapid rate than that of the growth in bovine population.

TABLE 4: ESTIMATED FEED SUPPLY IN INDIA ($10^6$ TONNES) FROM CROP PRODUCTION

| Year | Roughages | Concentrates | Total Digestible Nutrients (TDN) | Digestible Crude Protein (DCP) |
|---|---|---|---|---|
| 1961-66 | 273.5 | 12.5 | 119.5 | 1.60 |
| 1962-67 | 272.0 | 11.5 | 119.0 | 1.71 |
| 1963-68 | 279.0 | 11.2 | 123.1 | 1.84 |
| 1964-69 | 285.1 | 12.4 | 126.6 | 1.97 |
| 1965-70 | 293.8 | 11.5 | 129.5 | 1.65 |
| 1966-71 | 316.8 | 13.2 | 140.8 | 1.79 |
| 1967-72 | 318.7 | 13.7 | 141.3 | 2.04 |
| 1968-73 | 323.7 | 13.6 | 143.2 | 1.84 |

## IV

## Impact of Productivity of Milch Animals

In order to understand the implications of the increase in feed supply on productivity of the milch animal herd, it is useful to look at the state of animal nutrition in the country during the early sixties. Analysis of the data on feed consumption of various categories of bovinestock was undertaken by Amble, *et al*, and they compared the actual consumption with the estimated requirements using nutritional norms.[6] They arrived at the following finding:

> Comparisons showed that the animals are very much deficit in respect of proteins, the amount of DCP available being about 70 pe cent of the requirements for animals in milk about half the requirement for dry animals about two-fifths the requirement for adul males, about one-fifth for young stock i cattle and about only one-eighth of the re quirement of buffalo young stock. The posi tion is somewhat better in respect of tota Digestible Nutrients.

Viewed against this background, the in crease in feed supply attains significanc in understanding the trend in milk pro duction. Since the animals had remaine heavily underfed, increase in feed suppl definitely would have contributed to im provement in their nutritional status an increase in their productivity. Howeve the impact of increase in feed suppl depended on the pattern of allocatio followed by the farmers, of the addition feed to specific categories of the bovin stock.

Insight into the pattern of feed co sumption among different categories the bovinestock is obtained from the mi production surveys conducted by the I stitute of Agricultural Research Statisti The data relating to Punjab plains (giv in Table 6) indicate the following:

(1) She-buffalo in milk, which is the dom nant milch animal species in the regio received the highest level of feed inp

in terms of TDN and DCP.

(2) Draught animals received the second place in feed output.

(3) Cows in milk and dry she-buffaloes received the third position and dry cows received the fourth position in feed input.

(4) The lowest level of feed input was for cattle and buffalo young stock.

Similar data are available for most of the important animal husbandry tracts in the country. The pattern observed in the Punjab plains is found to be true in all other regions in the country, where she-buffalo is the dominant milch animal species. But in regions where she-cattle is the dominant source of milk production, cows in milk received the highest level of feed input followed by draught animals, adult females not in milk, and finally, young stock.

What are the factors behind this pattern of bovine feeding? It is an undisputed fact that draught power is essential to sustain food production. Thus the farmer has to give first priority in the allocation of feed at his disposal to maintaining the draught animal stock. However, the working stock is employed only for a few months in a year during cultivation operations; during the rest of the year they remain unutilised. On the other hand, animals in milk give continuous streams of output for at least 8 to 10 months which, apart from contributing to the households nutrition, also fetches cash income by sale of milk. Therefore expensive concentrate feed is given more to animals in milk. Work animals are fed with concentrate feeds during the cultivation seasons. The remaining stock is maintained mostly with roughages supplemented with concentrate feed available after feeding animals in milk and the working stock.

While the rationale behind the farmers' bovine feeding practices may have remained unchanged over time, the increase in feed supply in recent years (especially that of concentrate feeds) may have gone largely for milk production, for the following reasons: (1) The draught animal population in India has remained stationary during the last fifteen years.[8] Bulk of the additional farm power requirement due to increase in cultivated area and cropping intensity was met from mechanical sources especially tractors, oil engines and electric pumpsets; (2) The returns to better feeding of the existing stock of draught animals have not increased over time. Given the fact that the average farm size is very low in India and that it has been declining over time, increase in cultivated area or cropping intensity does not need any increase in the level of feeding of draught animals. Already the utilisation rate of draught animals is very low and any additional increase in the requirement of draught power can be met by increasing its rate of utilisation; (3) At the same time relative to draught animals, the returns to better feeding of milk animals have increased over time. The growth in demand for milk in India has been moving at a faster rate than supply; and in the face of an expanding market for milk, more and more feed resources have been getting into milk production. Because of the increasing claim on feed resources for milk production, in regions where the scarcity of feed is more severe, farmers have even reduced the stock of their draught animals.[9] This process is accelerated in recent years due to increase in the rate of commercialisation of milk production.

Most of the increase in concentrate feed supply in recent years must have gone for feeding animals in milk because of the quick response of concentrate feed input to milk yield. According to a study by John Mellor, *et al*,[10] when the concentrate feed input is very low, the productivity of she-buffalo is also very low, but as the level of concentrate feeding increases, the level of productivity increases more than proportionately (see Table 7). However, at high levels of concentrate feeding increase in productivity in response to increase in concentrate feeding declines at a faster rate. There are a large number of response function studies available for cows and she-buffaloes which show almost similar patterns.

The nature of the response function has significant implication for understanding the impact of increase in concentrate feed supply on milk production. Under average management conditions in which milch animals are reared in rural areas, the level of concentrate feed input is at the lower end of the response function. Thus any increase in concentrate feed input will result in a siginficant increase in the productivity of the milch animal population. Since the supply of concentrate feed has been increasing at a faster rate from the mid-seventies, it must have resulted in siginficant increase in the availability of concentrate feed to milch animal population and consequently to substantial increases in milk production. The data for the period since the mid-seventies do in fact show such a significant increase in milk production.

## V

## Changes in Conversion Efficiency of Milch Animal Herd

While concentrate feed constitues the main source of protein for milch animals, roughages form an important source of energy. In order to bring out how the increase in the supply of roughages along with increase in concentrate feed has contributed to increase in milk production, it is essential to examine the changes in the conversion efficiency of milch animal herd.

Conversion efficiency of milch animals is generally measured in terms of the percentage of feed energy and feed pro-

TABLE 7: RELATIONSHIP BETWEEN LEVEL OF CONCENTRATE FEEDING TO BUFFALOES AND LEVEL OF MILK YIELD

| Concentrates Fed/ Animal/Day (kg) | Milk Yield/Animal/ Day (kg) |

Source: V M Amble, *et al*, (1965).

tein intake which are converted into milk. The efficiency of feed energy utilisation for cows ranges from 4 to 35 per cent and of feed protein utilisation from 4 to 26 per cent. Among cows, the best turnover (25-30) is observed for high yielding breeds for both energy and protein. For the local breed of cows the corresponding values range from 4 to 6 per cent. For she-buffaloes, the high yielders show poorer conversion rates of 20 per cent for energy and 15 per cent for protein. But buffaloes with lesser outputs fed on roughages and grain by-products show the highest conversion efficiency of 35 per cent and 26 per cent respectively.

The buffalo breeds found in India are the most efficient in converting a large supply of crop residues and grain by-products into milk. They are followed by the high quality milch animal breeds like Jersey, and most importantly the cross-bred cows. It is interesting to note that the primary function of cattle in India historically has been for producing male calves. Thus most of the indigenous breeds of cattle are poor producers of milk. Attempts to improve on the quality of indigenous cattle breeds through cross-breeding and upgrading began in India towards the early part of this century. But it became widespread only in recent years. Now cross-breeding of cattle is an important component of the strategy for increasing milk production.

The conversion efficiency of milch animal herd in India must have been increasing over time, if there were significant increases in (a) the population of she-buffaloes relative to that of she-cattle, and (b) the percentage of cross-bred cows and other high quality breeds in the she-cattle population.

Data on the population of she-cattle and she-buffaloes are available on a quinquennial basis from the Livestock Census. These data for the last two decades have shown very interesting trends (see Table 8). The she-buffalo population has been increasing at a much faster rate than that of she-cattle. While the she-buffalo population increased from 25 million to 31 million during the period 1961-77, the she-cattle population increased from 54 million to 57.5 million. In other words, when the she-buffalo population increased by about 24 per cent, the she-cattle population increased only by 6 per cent. Consequently, a sharp decline is observed in the ratio of cows to she-buffaloes; from 2.16 to 1.83. Such a decline is observed in both the in-milk and the dry categories implying that in the farmers' choice of milch animal, the more efficient species has been receiving priority over the less efficient species. In this context one has to emphasise the fact that the significant increase in the production of crop residues and the possibility of producing more quantum of milk with it by using the she-buffaloes has played an important role in shaping the species composition.

In the absence of time series data on breed composition of the cattle population in India, it is difficult to make any judgment on the changes in conversion efficiency of the milch cattle population. However some insight into this can be obtained by examining the proportion of cows in milk in the total milch animal herd. High quality milch cattle breeds have a lower age of first calving, longer lactation length and shorter inter-calving interval. Therefore as the proportion of high quality breeds in the she-cattle population increases the proportion of animals in milk will also tend to increase. Data on the percentage of animals in milk for recent years are given in Table 8. The proportion of high quality breeds has shown only a marginal increase indicating that the efforts to improve the breeds have not so far made any siginficant dent in raising the conversion efficiency of the she-cattle herd.

Further evidence in support of this argument is available from the latest Livestock Census. For the first time classification of the cattle population by cross-bred and indigenous breeds is available in this Census. Unfortunately such data are not yet released for all the states and for the country as a whole. However the published data for eight states give very interesting results (see Table 9). Some of these states, namely, Kerala, Karnataka, Tamil Nadu and Orissa, have a long history of cross-breeding. In Kerala cross-breeding has been instrumental in significantly increasing the proportion of cross-breds in the she-cattle population; slightly over 60 per cent of the she-cattle in this state is cross-bred. In Karanataka and Tamil Nadu the cross-bred population is less than five per cent. In other states this percentage is less than one.

## VI

## Role of Operation Flood

The fact that there has been a significant breakthrough in milk production in recent years and that its main source is increase in productivity of milch animal herd is evident from our foregoing analysis. We have also shown that the increase in productivity has been facilitated largely by increase in the quantum and quality of feed supply due to rapid increase in agricultural production and, to some extent, improvement in conversion efficiency of the milch animal herd. However, if we look at the existing discussion on the factors responsible for the White Revolution in India, we may see that the above aspects have received only very little attention, the credit for the breakthrough being showered on the Operation Flood Project. Against the background of our analysis, we will now try to bring out the extent to which Operation Flood must have contributed to the breakthrough in milk production.

Operation Flood is the largest single dairy development project so far launched in India. The basic concept behind the project was to increase the rate of commercialisation of milk production by providing on the one hand an assured market for milk to the rural producers by linking rural milksheds with urban milk markets and on the other side to extend to them inputs like artificial insemination for cross-breeding and upgrading, compounded cattle feed, veterinary care, etc, for enhancing the productivity of milch animals. For this a chain of marketing and processing network and infrastructural facilities for extending inputs to producers were established. The organisational structure for implementing these tasks was the Anand Model dairy co-operatives with milk producers as primary members.

The first phase of this project began in 1970 and was completed in 1981. The total investment of this phase (about Rs 1,000 million) was met from the EEC-donated dairy commodities channelled through the World Food Programme. In the allocation of funds among various activities, about 64 per cent was given for building up milk processing and marketing capacity. Production enhancement programme got 26 per cent of the allocation and the remaining 10 per cent was spent on creating supplementary items like storage, long distance transport, project planning, etc.[11] The major achievement of OF I towards the end of the project period were the following:

(1) About 9,000 village dairy co-operatives with 1.3 million farmer members were established in 18 milksheds. The estimated number of animals in the co-operative ambit was 2.1 million.

(2) About 1,800 village co-operatives were provided with artificial insemination facilities. In the eighteen milksheds, about 200 veterinary clinics were also established.

(3) A daily procurement capacity of 2.15 million litres of milk was created in these milksheds. Simultaneously raw milk processing capacity of 3.1 million litres per day was also created.

(4) Indigenous production of milk powder increased from 22.4 thousand metric tonnes in 1970-71 to 64 thousand metric tonnes by 1979-80. Consequently the commercial import of milk powder was stopped from 1975-76.

(5) Work was in progress to bring in nine more districts into the fold of OF I.

(6) In the metropolitan cities of Bombay, Madras, Calcutta and Delhi a total handling capacity of 2.9 million litres of milk daily was created. The procurement of milk to the mother dairies was about 1.6 million litres daily and daily throughput was 2.2 million litres. The mother dairies shared about 55 per cent of the metropolitan milk market and consequently they were able to influence the price of milk.

It appears from above that the progress of OF I was very impressive. The same viewpoint was endorsed earlier by the UN/WFPA Evaluation Missions.[12] However, we have serious doubts on the extent to which OF I has contributed to a rapid increase in milk production in India. The reasons for this are the following:

(1) We have no doubt that in the OF milksheds, production of milk must have increased due to increase in the commercialisation of milk production. Given the fact that better feeding of milch animals would result in increased productivity and that commercialisation of milk production would result in more intensive feeding of milch animals, that is what we would expect.

(2) However under OF I only less than three per cent (slightly over two million out of 90 million milch animals in the country) of the milch animals were covered and therefore whatever be the increase in productivity of the stock it would not affect to any significant extent the trend in milk production for the country as a whole. At the same time the implementation of OF I definitely would have introduced some amount of new dynamism to the sector.

With the launching of the second phase of Operation Flood in 1981, the element of dynamism introduced into the dairy sector through OF I must have gained a faster momentum.[13] This is because of the large scale operation of OF II. About 160 districts (about 45 per cent of the total number of districts in India) distributed over 16 states are covered by this programme.[14] When the project is complete at least 40 per cent of the milch animal population will come into the ambit of the project. Therefore this phase, unlike the first phase, is likely to have a significant impact on the milk economy of the country. In this context, a close look at the OF II strategy keeping in mind the natural evolution of the dairy sector will provide us valuable insight in judging its long term impact.

## VII

## Implications for Future Development

In the natural evolution of India's dairy economy, an important feature we observe is the contribution of the sector to the maintenance of a positive energy balance with the rest of the food system. Production of milk has been largely with by-products from the agricultural sector and some amount of supplementary feeding of grains and oilcakes. And given the fact that productivity of milch animals rises faster with supplementary feeding of concentrates the energy balance in milk production has remained positive. This type of a dairy industry is ideal to the food system, since it competed minimally with man for edible resources. India's success in achieving a significant breakthrough in milk production, keeping intact a positive energy balance, has been primarily because of the rapid increase in agricultural production.

With the implementation of Operation

Flood II, the positive energy balance in India's dairy economy is likely to become negative. The reason lies in the OF II strategy for increasing milk production.[15] The main features of the strategy are the following:

(1) Raising a special herd of milch animals (known as the National Milch Herd) numbering about 10 million in the OF II milkshed areas. This National Herd will be produced by using the advanced breeding techniques of artificial insemination and progeny testing. They are expected to convert scarce feeds (mostly concentrates and green fodder) into milk with greater efficiency than the local type animals.

(2) A comprehensive programme for rearing the calves of these superior milch animals with emphasis on adequate nutrition and health care. Milk replacers and calf starters will be used to ensure rapid growth and early maturity.

(3) In order to meet the feed requirements of the National Milch Herd, a comprehensive fodder production and feed milling scheme is also contained in the strategy. About two million hectares of irrigated area will be diverted by the farmers in the OF II milksheds to the production of green fodder. Feed-milling plants will be set up to supply milkshed areas with the required amount of concentrate feeds.

Thus a Western Model of dairying based on hybrid milch animals fed with grain, oilcake and supplemented with cultivated green fodder is the main thrust of this strategy. The energy balance of this specialised model in the food system will be negative since most of the resources used here can be used directly for producing food for human consumption. Conversion of these resources into milk through animals is an inefficient process. This model stands in contra-distinction with the 'integrated model' of dairy development that has evolved in India. From the point of view of maintaining the energy balance in the food system it is important to move away from the 'western model' to an effective 'integrated model'.

In order to make the 'integrated model' more effective, efforts should be directed towards minimising the pressure of animals on land and at the same time helping increase the productivity per unit of land. Once productivity of land increases, livestock productivity will also tend to increase, since there is a positive linkage between the two. The main features of a strategy to achieve this objective should include the following: (1) Community management of wasteland to produce fooder and wood, (2) Community management of village ponds to increase fish production and that of aquatic plants for fodder, (3) Introduction of gobar gas plants to lessen the need to burn cattle dung and straw as fuel, (4) The introduction of smokeless stoves to reduce the amount of fuel needed for cooking, (5) Larger crop production and hence larger crop by-products by improved manuring through gobar gas plant slurry, (6) Treatment of straw with chemicals to increase its feeding value, (7) Re-allocation to calves of some of the concentrate feeds given at present to cows and bullocks, and (8) Preferential health care to calves. It should be possible to increase livestock productivity substantially without encroaching on any cultivated area specifically for feed production. In the context of this strategy, there are several measures that would improve the reproductive performance of cattle and buffaloes and also their genetic productive potential. It is, however, beyond the scope of this paper to enter into a discussion of such measures.

## Notes

[This is an abridged version of a paper prepared on request by the IDPAD/Dairy Project at the Institute of Social Studies, Hague. Discussions with P S George, P R G Nair, Martin Doornbos, P Terhal and Frank V Dostan were helpful in shaping some of the ideas of this paper. However, the author alone is responsible for the views expressed and the defects that remain.]

1 For a discussion of the various methods used for estimating milk production and its limitations by the Ministry of Agriculture and the Central Statistical Organisation, see, J W Mellor and De Pontives B, 'Effect of Growth in Demand for Milk on the Demand for Concentrate Feeds in India, 1951-66', *Indian Journal of Agricultural Economics*, 19, 131, 1964.

2 The discussion of the methodology used in the Integrated Milk Production Surveys and the estimates of milk production and productivity of milch animals for most of the states in India is available in D Singh, *et al*, 'Monograph on Estimation of Milk Production', Institute of Agricultural Research Statistics ICAR, New Delhi (undated).

3 This decomposition scheme is similar to the one developed by Minhas and Vaidyanathan for decomposing agricultural growth. For details, see, B S Minhas and A Vaidyanathan, 'Growth of Crop Output in India (1951-54 to 1958-61): An Analysis by Component Elements', *Indian Journal of Agricultural Statistics*, Vol XVII, No 2, 1965.

4 The estimated production of cultivated green fodder in India is about 230 million tonnes. This estimate is based on an average yield of 50 tonnes per hectare for irrigated area and 25 tonnes per unirrigated area. See, for details, Government of India, "Report of the National Commission on Agriculture, Part VII, Animal Husbandry", Ministry of Agriculture and Irrigation, New Delhi, 1976.

5 The straw-grain ratios used in our estimates are taken from K P S Nirman, *et al*, 'Estimation of Crop Residues Using Grain to Straw Ratios: Agricultural Situation in India, June 1982'. Our estimates have taken into account the impact of high yielding varieties on straw output.

6 The values of TDN and DCP for various items of feed are taken from K C Sen, 'Nutritive Value of Indian Cattle Feeds and the Feeding of Animals', Indian Council of Agricultural Research, New Delhi.

7 V N Amble, *et al*, 'Milk Production of Bovines in India and Their Feed Availability', *Indian Journal of Vet Science*, No 35, September 1965.

8 For discussion of the growth of draught-animal power in India and the extent to which mechanisation is replacing it, see, R K Sharma, "Draught Power Planning in Indian Agriculture", Ph D thesis, Department of Economics, University of Delhi, 1981.

9 Evidence in support of the reduction in draught animal holdings due to increased pressure on feed resources for increasing milk production is observed in all the parts of Kerala state. For details, see, K N Nair, "Bovine Holdings in Kerala: An Analysis of Factors Governing Demand and Supply", Ph D thesis, University of Kerala, 1981.

# Problems and Prospects of Sugar Industry

### By Bahubali Gulabchand

A SIZEABLE section of the sugar industry continues to be on the sick list. The production which drastically declined last year, is showing some signs of recovery this year, but recovery will be only marginal; the outlook for next year's production, too, does not look very bright. The sugar stock position is none too happy, and instead of exporting sugar it seems that the country will have to be importing sugar to keep up supplies to the free market, as major portion of free sugar has already been released and remaining stock will not go far.

Being an agro based industry dependent on the ready availability of a highly perishable crop like sugarcane, output fluctuations are inevitable. While we must keep on trying our utmost to find ways and means and think of all possible measures that we can adopt to stabilise the sugar production, all we can hope for is to possibly tame violent fluctuations but wide fluctuations cannot be avoided altogether so long as almost every aspect of industry continues to be under the rigid controls. The strategy for management of sugar economy will therefore have to be evolved taking wide fluctuations of production into account.

There is a five year cycle of sugarcane and sugar production. Our production during the first quinquennium was 136.87 lakh tonnes, 157.53 lakh tonnes in the second, 194.63 lakh tonnes in the third, 252.59 lakh tonnes in the fourth and 339 lakh tonnes in the fifth current quinquennium 1981-85. Thus, the rate of growth of production has been going up progressively from 15.09% in the second quinquennium to 23.53% in the third, 29.78% during the fourth and now 34.20% during the current quinquennium. In spite of such growth in production during current five year cycle, we do not have an export surplus but are talking of importing a sizeable quantity of sugar from abroad. This is because we have boosted up the consumption too rapidly and well beyond our means by extravagent releases of sugar, particularly free sugar into market, month after month for past two or three years, irrespective of the precipitous fall in production and thus frittered away most of our stocks built up during high production year. This has also weakened our sugar economy by pushing a sizeable section of the industry, whether in private, co-operative or Government sector into red, by depressing the prices of free sugar to uneconomic levels.

Since 1982-83 a policy of larger releases of free sugar has been continuously followed. The ratio of release of levy and free sugar which was 58:42 in 1981-82 deteriorated to 55:45 in 1982-83. In 1983-84 it was allowed to deteriorate further to 49:51 and for the first time since the adoption of the partial decontrol policy, the free sugar releases exceeded those of levy sugar. Instead of arresting this trend, and taking corrective measures by cutting down on releases of free sugar, this undesirable trend has been continued unabated during the current sugar year also, and the ratio of levy and free sale sugar released this year till end of May has further deteriorated to 45:55.

**Shri Bahubali Gulabchand**
**President,**
**Indian Sugar Mills Association**

The policy regarding sugar consumption, therefore, needs to be reviewed in this light. If the releases of free sugar are to be maintained at present level, it seems inevitable that the ratio of levy and free sugar be modified to 50:50. Alternatively, we will have to keep on importing sugar year after year. Third alternative would be to correct the imbalance in the present policy by bringing down the quantum of free sugar releases to about two thirds of that of levy sugar, i e, reestablishing the 60:40 ratio in consumption of levy and free sugar. This however does not seem to be politically feasible.

The average sugar price in India including the price of free market sugar is one of the lowest in the world. There are very few countries in the world where the consumer price of sugar is ruling as low as it is in India. Sugar is selling in other countries at an average retail price of more than Rs. 6 per kg. Besides, unlike India, there is no dual pricing system in these places and all sugar is sold at the same retail price. The average of retail price of levy and free sugar in India is around Rs. 5.00 or 5.25 per kg. In spite of the present low level of export price of sugar in the international market, no sugar producing country has, in its economic wisdom, allowed the internal prices of sugar to crash or go down, because they realise that any sizeable fall in prices is bound to have a deleterious effect on their sugar production and sugar economy as is happening in India.

Almost every type of policy of control, decontrol, partial decontrol,only distribution control, only price control, etc, have been tried from time to time for bringing about some stability in sugar economy of the country but without much success. Though selection of a right policy is important, it is not so much the question as to which policy is suitable but what is important is how it is administered. The policy of partial decontrol is a healthy mixture of rigidity and flexibility and this policy should be able to deliver the goods, provided, of course, it is properly administered. Unfortunately, the policy of partial decontrol as it is administered is not really a policy of partial decontrol, but it has degenerated into complete control with dual pricing which is not the same as the policy of partial decontrol. As a first step towards the stabilisation of the sugar economy, we will have to strive for adoption of the proper partial decontrol policy by the Government.

(Adapted from the Presidential Address of Shri Bahubali Gulabchand at the 51st Annual General Meeting of the Indian Sugar Mills Association, held on 28th May, 1985, at New Delhi.)

work like Chris Bayly's "Rules, Townsmen, and Bazars" does represent a heroic and fascinating effort to transcend traditional barriers between the economic, the socio-cultural and the political.[29]

A number of major limitations persist. A considerable gap still remains between our understanding of the basic structures and tendencies of the colonial economy—considerably deepened today by recent research—and the much-explored history of political movements in late colonial India, generally subsumed, a little too readily perhaps, under the rubric of nationalism. More precisely, this area of silence relates to the vast and virtually unexplored terrain of forms of popular consciousness and culture, as distinct from ideological currents within the intelligentia on which there has been considerable work of a rather old-fashioned, 'intellectual history' type.[30] The gap is obviously related also to the very evident lack of fruitful dialogue between history, sociology and social anthropology. Our sub-continent provided the subject-matter for some of the earliest classics of anthropological field-work—most notably Radcliffe-Brown's study of Andaman islanders—and yet it is only quite recently that professional historians have started getting interested in tribal societies (and even then, mainly in tribal rebellions). Caste for long remained almost a taboo word among many of us. It occurs only three times in the index of R P Dutt's "India Today",[31] and—to indulge for a moment in an auto-critique—I feel now that a serious lacunae in my study of the Swadeshi movement in Bengal consisted in my inability or unwillingness to relate the data on 'caste movements' of Mahishyas, Namasudras, and others to my overall analytical framework.[32]

Such silences have had manifold consequences. Not only do large tracts of human experience remain unexplored: studies of women, for instance, only just beginning to attract serious historical attention, and even so somehow automatically relegated to women colleagues and usually confined to limited themes like education and social reform. The absence of genuine social history also produces low-order explanation even in apparently much-trodden areas. It is not really possible, for example, to bridge the gap between colonial structure and nationalist or other protest by means of an insufficiently analysed, rigid, and over-general concept of 'class', abstracted from any real empirical analysis of the concrete problems of class-formation through conflict between living human beings in groups.[33] Such 'Marxism' is all too-easily 'refutable', for textbook or programmatic formulas regarding the 'national' bourgeoisie or the working class soon reveal their inadequacies when confronted by micro-studies reality of enormous variations, the persistence and even refurbishing of 'traditional' ties of caste and religion, or the importance often of vertical patron-client linkages. It may be argued, further, that a historiography limited to conventional tools and sources has an almost built-in tendency to become more elitist as it turns more sophisticated, and that this has been happening in our field: for private papers, accepted now-a-days as the most 'authentic' source of all, are bound to have an overwhelmingly official or upper-class origin in a largely illiterate country.

So far as studies of popular movements are concerned, the failure to grapple seriously with problems of consciousness and culture leads repeatedly to inadequate or even trite explanations, in particular the two related poles, trenchantly and effectively attacked recently by Ranajit Guha, of economic reductionism and mobilisation by great leaders/ideologies or skilful manipulators of patron-client linkages.[34] Rebellion is presented either "as an instinctive and almost mindless response to physical suffering of one kind or another",[35] or simply a matter of effective organisation from the top: both tend to exclude the insurgent as the subject of history.[36] It is not that economic pressures, outsider leadership interventions, or even on occasion factional linkages are unimportant or not worth exploring, but surely we need to remember Thompson's withering comment about a simple hunger-protest nexus being as self-evident and as limited as the fact "that the onset of sexual maturity can be correlated with a greater frequency of sexual activity."[37] As for automaticity of the second type, otherwise inert masses responding to politico-ideological stimuli, or coherts of 'clients' meekly trooping off at the command of their 'patrons', Thompson's analysis of 18th century English 'paternalism' and 'deference' appear again extremely relevant: deference "could be seen from below as being one part necessary self-preservation, one part the calculated extraction of whatever could be extracted".[38] Patronage in other words can be a far more complex, nuanced, and varying concept than imagined by the so-called 'Cambridge school'.

The virtual absence of research on popular culture creates problems even for radical-minded historians who would like to avoid any ascription of inertness or passivity to tribals, peasants, or workers. Repeatedly evident here are signs of romanticisation, anachronism, and teleology: an implicit assumption about a kind of innate popular militancy or rebelliousness; a concentration on moments of open rebellion alone; tendencies to view all manifestations of plebian initiative or autonomy as laudable and progressive; the ascription of present-day political and socio-economic concerns to leaders like Titu Mir, Sidhu and Kanhu, or Birsa Munda;[39] and persistent, at times almost desperate, attempts to relate all popular rebellions to general currents of anti-imperialism or social change. Such romanticisation appears particularly inappropriate in a country which has just witnessed the undoubtedly plebian appeal of Bhindranwale as well as the 'popular' Hindu communalist backlash following the assassination of Indira Gandhi.

To make the discussion more concrete, I would like to take up now two examples from areas which have been central to my own teaching and research work: popular, more specifically peasant, nationalism in the 20th century, and the intellectual history of 19th century Bengal. In both fields one notices a repeated tendency for interesting historiographical departures to get bogged down in old and sterile polemics, and it is such mental blocks that have made me increasingly aware of the need for the development of a genuine social history.

'Subaltern studies', with its critique of all varieties of 'elitism', whether colonialist, nationalist, or even 'Marxist', its focus on lower class initiatives, and its pioneering efforts to tackle problems of popular consciousness with the aid of tools adapted from anthropology and structural linguistics, does represent a major breakthrough in our history-writing. A not-uncritical reviewer has even compared the possible impact of Ranajit Guha's "Elementary Aspects" with that of D D Kosambi a generation back. Yet much of the debate provoked by this departure seems to have already acquired a certain staleness, an incapacity to pinpoint the real problems. Personally I am neither provoked nor particularly enthralled by the term 'subaltern'. 'Plebian' (as used by E P Thompson for 18th century England) or 'popular', could have also served much the same purpose, related to the need for some kind of omnibus category in pre-capitalist situations where class-formation is still relatively inchoate. 'Subaltern' does have a certain advantage, however, insofar as it is used to pinpoint basic relationships of power, of domination and subordination—relationships which may often be cross-cutting, involving distinction of caste and gender as well as of class, and in which the 'subaltern' of one specific context may well be simultaneously the dominant group in another. An obvious example might be an exploited intermediate caste male peasant employing low-caste landless labour and lording it over his wife and children.[40] Such terminological issues apart, it is unfortunate that the subaltern studies enterprise is often being viewed through the very old prism of an organisation/autonomy debate, endemic in Indian Marxist circles since the 1920s, with Guha and some of his associates charged with the heresy of 'populism', of denying the role of vanguard elements. At times we seem to be going back to the well-established Gandhi-as-great-man/Gandhi-the-great-betrayer-syndrome, and the dust raised by such sterile debates only obscures some of the real problems with Guha's approach: the extent of relevance of somewhat simplistic binary models, for example, or the dangers of a certain abstraction from specific contexts of time and region involved in a quest for "elementary aspects".[41]

The tendency for new endeavours to get sucked back into old debates has shown itself also in the controversies about the relevance of the 'renaissance' model for understanding 'middle class' intellectual history of 19th century Bengal. Some of us had argued that the analogy was inappropriate, based as it was on a unilinear concept of historical development which gave inadequate attention to the peculiar twisted logic of colonialism. The search for distant progenitors of present-day values, most notably in Rammohun, represented a kind of 'Whig' interpretation which had to be overcome if we wanted to avoid the pitfalls of anachronism and teleology.[42] Attempts were made to situate Rammohun, David Hare, Young Bengal, and Vidyasagar more firmly within their specific contexts.[43] But many mistook all this as some kind of exercise in debunking or iconoclasm, and soon we were back to a great/little man debate, about the 'role', 'progressive' or otherwise, of particular movements or personalities.

I have come to feel increasingly that such polemical bogs can be avoided only through a major broadening of approach, sources and methods, a leap towards genuine social history. The organisation/autonomy debate in the history of mass nationalism, for instance, can be transformed if re-read in terms of a common 'language', permitting a communication and yet susceptible to a variety of nuance of idiom, style and meaning as different social strata interpreted it in the light of their specific and often conflicting interests and traditions. I have in mind something along the lines of W H Sewell's recent fascinating study of the 'language of labour' in late 18th and early 19th century France, in which the "corporate" idiom is revealed to have been capable of a multitude of subtle shifts over both time and social space.[44] There is considerable scope here for methods of semiological analysis, having as their subject-matter both verbal and non-verbal communication: the rich ambience, for instance, acquired by signs like charkha, khadi or salt, the importance of which surely far transcended the immediate material gains they might have brought to their patriotic users.[45] Such approaches may give us new insights into the strength and strange persistence of Gandhi's appeal, despite numerous 'betrayals', by focusing on its deeply religious nature, its dominant idiom of sacrifice and renunciation.[46] The complex intermingling—indeed, often the near-identification—of the language of patriotism with that of religion demands a subtler, analysis than that offered by assumptions about distinct 'secular' and 'revivalist' trends, with 'nationalism' a thing apart from 'communalism', and politicians only 'using' religion.

Starting from a specific area, movement, or even perhaps a single well-documented incident, analysis of this type may go very much deeper: many of the rumours about the Mahatma as miracle-worker collected by Shahid Amin from Gorakhpur, for instance,[47] can make sense only if placed in the context of traditions of popular culture. The problem of interaction between levels of nationalism leads on, therefore, to that of levels within society, culture, and religion—a problem which in the context of Hinduism has already provided the staple for a central and recurrent debate in social anthropology.[48] Historians need to participate in that debate, and make their own specific contributions to it, keeping in mind E P Thompson's warning that while entering into a necessary and fruitful dialogue with anthropology, history cannot cease to remain "a discipline of context and process".[49] Similar problems, about the validity of elite/popular distinctions in culture, as well as the need to recognise both the possibilities of communications across social strata and of autonomous variations or interpretations, have come to occupy a central place in the concerns of social historians in many parts of the world.[50]

The somewhat arid field of the nineteenth century 'renaissance', for long left to middle class self-praise or flagellation, can also be transformed if brought into relationship with this central problematic. I feel that a close reading of the multitude of texts left by our nineteenth century worthies—religious treatises, literary works, autobiographies, the rich collection of vernacular tracts at the Indian Office Library—can still reveal unexpected treasures, particularly if brought into juxtaposition with evidence concerning earlier religious traditions and contemporary popular culture. Recently I have been trying to do some work on one such text, extremely well known in Bengal but untouched so far by professional historians: the *Ramakrishna-Kathamrita*, remarkable, indeed unique, for its verbatim recording of actual conversation, for a period of some six years, 1881-1886, between the saint and his disciples. A conversation, moreover, which represented a leap across social space, for Ramakrishna was a rustic Brahman with a family holding of only one-and-a-half bighas and a little formal learning, his disciples by the early 1880s entirely educated Calcutta *bhadralok*. The *Kathamrita* provides an index to changing *bhadralok* mentalities—for Ramakrishna acquired a middle class clientale only in the later 1870s and early 1880s, more than twenty years after he had settled at Dakshineshwar—and more interestingly, some clues for understanding the mental world of rural Bengal.[51] As such, it can be a valuable supplement to the efforts being made today to reconstruct peasant consciousness from moments of rebellion alone.

As the conversation of a man involved in a process of social ascent, the *Kathamrita* proves to be a valuable text for probing into basic relationships of power. A central image in it is the richly ambiguous figure of the *babu* or *baromanush*: living in idleness, chewing *pan* without care, with well-trimmed moustaches, far away from thoughts of *Iswara*;[52] and yet someone who has to be pleased, whose patronge is essential for survival, whose heart can be won through devotion and love, and who often becomes strangely homologous with divinity itself.[53] Ramakrishna's attitudes towards authority inextricably combine subservience and, not exactly revolt, but certainly resentment: a reminder, perhaps, that a binary model of subordination/revolt is not always helpful. He loved to recall the days of his "madness" or ecstacy when he "had no fear of big people", and had even slapped his patron Rani Rashmoni once for being inattentive during a devotional song.[54] In one, isolated, but remarkable, conversation, Ramakrishna identified himself for a brief moment with the apocalyptic *Kalki-avatar*: "A Brahman's son—he knows nothing—suddenly a horse and sword will come . . . "[55] And yet Ramakrishna also recalled how he had become sure of his stature as a holy man only after the zamindars of his village home paid their respects to him.[56] Struck down by cancer at the height of his prestige among the *bhadralok*, he pleaded with the doctor: "Babu, please make me well . . . Babu! Babu! You must cure me"—like any peasant or poor man begging a favour from a social superior.[57] Subservience and resentment are reconciled in Ramakrishna through *bhakti*, representing a simultaneous internalisation and humanising of *adhikar-bheda*, or hierarchy, social as well as religious. In a series of homologous parables, the social inferior—servant, poor man's son, client—is shown as obtaining the favour of the king, *baromanush* or *babu* through *bhakti* and *seba* (devotion and service), at times brushing aside the *amlas* or intermediaries who try to block his way.[58] *Bhakti*, as perhaps through much of Indian history, seems to provide a kind of 'living-space' for the downtrodden: a living-space which is also a trap, for it has helped hierarchy and oppression to endure by making them appear less unendurable.

The servant can hope to relate himself through *bhakti* to the *babu*, clearly portrayed as a patron of a 'traditional' or 'paternalistic' type—but there is in Ramakrishna a second kind of model of subordination, much less acceptable: *chakri* or office-work, implying *dasatya* (bondage, slavery) under a *manib* (master, employer). What seems to make *chakri* intolerable for Ramakrishna was its connotation of an impersonal cash nexus, embodied above all in new, rigorous, discipline of time. He once told a disciple: "Your face seems to have a dark shadow upon it. That's because you are working in an office. In the office you have to handle money, keep accounts, do so much other work; you have to be alert all the time."[59] One is irresistibly reminded of E P Thompson's seminal essay on the transition from peasant-artisan to industrial time, and the plebian hostility to the change-over to the more rigorous routine of capitalist society.[60] In nineteenth century Bengal, it needs to be added, where the few factories were owned by foreigners and employed mainly non-Bengalees, and there was no capitalist breakthrough in agriculture, the principle locii for the imported ideas of bourgeois time and discipline became the office and the new type of schools and colleges.[61]

Space forbids any further exploration here of the unexpected riches of the *Kathamrita*[62] but I must add that it—together with *Lilaprasanga*, the standard biography of Ramakrishna—is replete with references to popular religious and cultural traditions which become meaningful only when read in conjunction with data collected by folklorists and anthropologists. Sacrilegious though it must sound, the intertwinning of submission and resentment in Ramakrishna's discourse remind one of James Freeman's life-history of Muli, a Bauri pimp of a village near Bhubaneswar whose "ambivalent responses reflect respect for, affection for, resentment of and rebellion against the same person".[63]

## III

So far I have pleaded for a greater openness towards anthropology and more awareness among us all of the work on social history going on in other countries. To avoid any possible misinterpretation, I would like to add now that I do not mean by this any wholesale borrowing, or a surrender of the necessary autonomy of our own discipline. Awareness is required precisely to avoid being swept away by the 'latest' intellectual fashions, which in any case usually reach our country after a considerable time-lag, and then tend to persist long after they have become outmoded elsewhere.[64]

It is necessary to recall, therefore, that the social history boom in the West has been accompanied by considerable, at times extremely trenchant, criticism. A young historian in 1979 went so far as to declare, in a conscious reversal of Hobsbawm, that "this is a bad time to be a social historian".[65]

Both the great possibilities and the real problems of a social history impregnated with anthropology can be brought into focus through the basic concept of 'culture'. Anthropologists have been using it to signify 'a whole way of life', the complex of interlocking institutions, customs, values and myths revealed through field-work: as Keith Thomas argued twenty years ago, the resultant perspective of totality has often given "a better impression of what *l'histoire integrale* might be" than much conventional history-writing.[66] Through anthropology, and today social history influenced by it, "behaviours and beliefs traditionally seen as senseless, irrelevant, or at best marginal curiosities (for instance, magic and superstition) have been analysed at last as valid human experiences".[67] Yet a dialogue with anthropology, as E P Thompson reminded a session of this Congress in 1977, was necessary but bound to be difficult.[68] The Genoveses, themselves major social historians, have bitterly attacked much contemporary social history for its abstraction from political and economic structures and processes, for threatening to develop into a kind of neo-antiquarian description of everyday life.[69] The ghost of Trevelyan's "history with the politics left out" has proved much more difficult to exorcise than Hobsbawm had expected.[70] Ranajit Guha's insistence on the centrality of the 'political' derives its value from an awareness of such dangers, and can be of help provided the 'political' is construed in terms of a variety of complex attitudes and actions generated by fundamental relationships of domination and subordination, and not identified only with open rebellion.

At a more general level, structural functionalism—still the dominant in Indian anthropology—does raise serious problems so far as most historians, and particularly Marxists, are concerned. The emphasis on 'functional' integration, cohesion and solidarity, derived from a combination of Durkheim with field-experience among (mostly) primitive groups, often appears as irrelevant or even some kind of prettifying neo-traditionalism in studies of more developed societies, shot through as they are by sharp conflicts of rank, caste or class. To many historians, it might make more sense to interpret culture as a 'whole way of conflict' rather than an undifferentiated 'whole way of life' common in the same way to all members of a society.[71] What adds considerably to the problem is that dominant schools of anthropology, structuralist as much as structural-functionalist, have a built-in preference for synchrony over diachrony, for more-or-less unchanging and uniform structures, and not processes or events; *langue* rather than *parole*, in Saussurean terminology. Some of Levi-Strauss' techniques may be helpful for us, but on the whole an anthropologist like Clifford Geertz has more to offer to historians, with his quest for 'thick description' of a specific situation, akin to an imaginative literary reading of texts rather than a formal 'decoding' operation.[72] And I feel that there is a lot to learn from Carlo Ginzburg's recent methodological essay on the 'conjectural paradigm', proceeding through a ferretting-out of 'clues', as the approach most suited for history, which "remains a science of a very particular kind, irremedially based on the concrete". Unlike the natural sciences, history cannot really afford to abstract from the qualitative and the individual,[73] and perhaps the same warning is applicable to the kind of anthropology most relevant for historians.

The convergence—despite all problems and tensions—between some of the most interesting types of anthropology and history today is illustrated by the similar conclusions arrived at, quite independently of each other and through work in utterly different styles and intellectual traditions, by E P Thompson in his "Poverty of Theory" (some polemical excesses apart) and Pierre Bourdieu in his "Outline of a Theory of Practice". Both the polemic against Althusser and the critique of structuralist and structural-functionalist anthropology focus on the problem of structure and agency, fundamental to the social sciences since at least Vico onwards: history is made by human beings, yet the products of their labour and thought repeatedly acquire an externality, an objectified or alienated character which dominates the makers and mystifies the cultural into the natural.[74] A 'scientific' and 'objective' focus on structures alone involves therefore living in and a surrender to a fetishicised world. In anthropology, Bourdieu has argued, 'model' and 'rule' have to be replaced by 'strategy', and he tries to arrive at a dialectical understanding of the tension between structure and agency through his basic concept of 'habitus'.[75]

The writings of Thompson or Bourdieu and the current "state of play" between history and anthropology[76] convey simultaneously a vivid awareness of the rich possibilities of work in a creative Marxian tradition, and a sense of acute dissatisfaction with much that passes under that label. Thompson's books and essays are replete with instances of his capacity to give "familiar sociological concepts ... a new dialectical ambivalence: an 'act of giving' must be seen simultaneously as an 'act of getting', a social consensus as a class hegemony, social control (very often) as class control ...";[77] Bourdieu situates himself in a philosophical tradition going back to Marx's "Theses on Feuerbach" and yet both would not doubt be regarded as heretical by many.

Marxism of a certain type has acquired considerable influence over Indian historiography in recent years, and today even dominates a number of areas. But one sometimes fears whether the success has not been too easy, and due largely to the weakness and lack of sophistication of alternative traditions.[78] Certainly Marxism has often reigned among us in considerably simplified forms: a rigid, virtually *a priori* conception of class-interest, derived automatically from economic conditions; and unquestioned acceptance of formulas of base and superstructure; faith in the primacy of the 'economic', balanced by the usual ritual concessions to interaction and relative autonomy; a consequent playing down of problems of culture and consciousness. Yet serious doubts have been raised elsewhere about the value of the base-superstructure model. It was only an analogy, after all, and by no means the only one which Marx experimented with;[79] and in any case it is important to remember that really original thinkers often have difficulties in conveying the full richness of their ideas through a language necessarily borrowed from others (in the case of the founders of Marxism, Hegelian, followed by positivistic). Again, it is surely impermissible to identify the mode of production with the 'economy', since it is very difficult to conceive of any system of productions relation abstracted from culture, law, and politics, i e, elements of the so-called 'superstructure'.[80] One of Marx's most profound insights was precisely that the rigorous separation and 'primacy' of the economic domain ('economic man') was a construct of bourgeois society and ideology.

Thus we need to move towards both "a materialist and relational concept of culture" and "a more culturally embedded analysis of the material world".[81] A social history developing through a fruitful, because critical, dialogue with anthropology can help us "in locating new problems, in seeing old problems in new ways, in an emphasis upon norms and value systems and upon rituals, in attention to expressive functions of forms of riot and disturbance, and upon symbolic expressions of authority, control and hegemony".[82] I feel that it is in such ways that the very rich Gramscian concept of hegemony can develop into a significant tool for historical analysis, and be rescued from the danger, which threatens it now that it has become quite fashionable, of becoming yet another cliche or formula. A Marxist historiography which is content only with the narrowly 'economic' or the 'political' is as emasculated as much contemporary Marxist practice, condemned in the absence of effective counter-hegemonic strategies to oscillate between economism and 'sectarian' adventures or 'reformist' opportunism in politics.

Exploring ever-new realms of lived experience, social history today is contributing to a realisation that "the seemingly most intimate details of private existence are actually structured by larger social relations",[83] bringing history much nearer to its writers or readers in an interaction that can deepen critical awareness of both the past and of ourselves. Focusing on "cultural and moral mediations ... the way ... material experience are handled ... culturally",[84] it enters a world in which agency, values, or moral choice can never be entirely submerged in a more or less passive contemplation of structures. Such awareness is not, however, always very comfortable, and this may help to explain some of the suspicion and hostility which social history seems to arouse at times. I am reminded of a discussion on syllabus revision that took place some months back in my University, in which a very young teacher, passionately pleading for a greater emphasis on social history, argued that history to be really meaningful could not remain unconnected with his everyday life, his relations with parents, loved ones, or neighbours. A senior academic pulled him up sharply for becoming so "individualistic". I do feel, however, that a history detached from such concerns, even when it is radical or Marxist in appearance, can never become more than—at best—a pleasant academic diversion, or—at worst—a way of entering the rat-race for jobs, promotions, and patronage. To adapt and expand a slogan of the women's liberation movement, 'the personal is the political'—and it must become the historical, too.

## Notes

[This paper was first presented as the author's Presidential Address to the Modern India Section of the Forty-Fifth Session of the Indian History Congress at Annamalai on December 27-29, 1984.]

1 Specialised journals in social history, Hobsbawm remarked, were rare till *Comparative Studies in Society and History* (1958). E J Hobsbawm, 'From Social History to the History of Society', *Daedalus*, V, 100, Winter 1971.

2 Elizabeth Fox-Genovese and Eugene Genovese, 'The Political Crisis of Social History: A Marxian Perspective', *Journal of Social History*, x, 1976; reprinted in *Ibid*, "Fruits of Merchant Capital: Slavery and Bourgeois Property in the Rise and Expansion of Capitalism", OUP, 1983.

3 Raphael Samuel and Gareth Stedman Jones, ed, "Culture, Ideology and Politics: Essays for Eric Hobsbawm", History Workshop Series, London, etc, 1982.

4 Thus Lawrence Stone talks about "the replacement of sociology and economics by anthropology as the most influential of the social sciences". 'The Revival of Narrative: Reflections on a New Old History', *Past and Present*, No 85, November 1979.

30 For the distinction between ideologies and *mentalite*, and the consequent relative decline of intellectual history', see M Vovelle, 'Ideologies and Mentalities', in Samuel and Jones, ed, "Culture, Ideology and Politics", op cit; William J Bouwsma, 'Intellectual History in the 1980s: From History of Ideas to History of Meaning', *Journal of Interdisciplinary History*, XII, 2, Autumn 1981; and Patrick H Hutton, 'The History of Mentalities: The New Map of Cultural History', *History and Theory*, Vol XX, 1981.

31 R P Dutt, op cit, Index, p 524.

32 I have tried to rectify the error to a partial extent in my 'The Conditions and Nature of Subatlern Militancy: Bengal from Swadeshi to Non-cooperation, c 1905-1922', in R Guha, ed, "Subaltern Studies, III", Delhi, 1984.

33 Cf particularly the extremely valuable critique in E P Thompson, 'Eighteenth Century English Society: Class Struggle without Class?', *Social History*, III, 2, May 1978.

34 Ranajit Guha, "Elementary Aspects of Peasant Insurgency in Colonial India", Delhi, 1983, Ch I, and *passim* see also Guha, 'The Prose of Counter-Insurgency", in Guha ed "Subaltern Studies, II", Delhi, 1982.

35 Guha, 'The Prose of Counter-Insurgency', op cit, p 3.

36 Guha, "Elementary Aspects", op cit, p 4.

37 E P Thompson, 'The Moral Economy of the English Crowd in the 18th Century', *Past and Present*, No 50, February 1971.

38 E P Thompson, 'Eighteenth Century English Society: Class Struggle without Class?' , *Social History*, III, 2, May 1978

39 For an effective critique of such anachronism as manifested in the writings of a radical scholar, see Guha, 'The Prose of Counter-Insurgency', op cit, pp 35-38.

40 I do not feel happy, therefore, with Guha's attempt in his introduction to "Subaltern Studies, I" to arrive at a general enumeration of subaltern groups in colonial India by simply subtracting certain 'elites'.

41 I owe many of these points to discussions with two Delhi University students, Saurabh Dube and Dilip Menon, and in particular to Saurabh Dube's 'Peasant Insurgency and Peasant Consciousness', published now in *Economic and Political Weekly*, March 16 1985.

42 See the articles by Ashok Sen, Barun De, Sumit Sarkar and Pradyumna Bhattacharya in V C Joshi, ed, "Rammohun Roy and the Process of Modernisation in India", Delhi, 1975, and Barun De, 'A Historical Critique of Renaissance Analogues for Nineteenth Century India', in Barun De, ed, "Perspectives in Social Sciences, I", Calcutta, etc, 1977.

43 Apart from the articles on Rammohun cited above, there was an unpublished paper by Barun De on David Hare; Sumit Sarkar, 'The Complexities of Young Bengal', *Nineteenth Century Studies*, October 1973, and

Asok Sen, "Iswarchandra Vidyasagar and His Elusive Milestones", Calcutta, 1977.

44 W H Sewell, "Work and Revolution in France: The Language of Labour from the Old Regime to 1848", Cambridge, 1980.

45 Satinath Bhaduri's fascinating Bengali novel *Dhorai Charit Manas*, Calcutta, 1949, depicts villagers in north Bihar identifying the charkha with the *Sudarshanchakra* of Krishna. For the nuances of salt, see Tanika Sarkar, "National Movement and Popular Protest in Bengal, 1928-34", unpublished thesis, Delhi University, 1981.

46 I attempted a preliminary, and I feel now in many ways quite inadequate, analysis of these problems in my 'Conditions and Nature of Subaltern Militancy: Bengal from Swadeshi to Non-Cooperation, 1905-1922', in R Guha, ed, "Subaltern Studies, III", Delhi, 1984.

47 Shahid Amin, 'Gandhi as Mahatma: Gorakhpur District, Eastern UP, 1921-22' in Guha, ed, "Subaltern Studies, III", Delhi, 1984.

48 Cf, for instance, Louis Dumont 'On the Different Aspects or Levels in Hinduism', in Dumont and Pocock, ed, "Contributions to Indian Sociology, III", 1959. For a very similar debate on levels within Chinese religion, see Arthur Wolf, ed, "Religion and Ritual in Chinese Society", California, 1974.

49 E P Thompson, 'Anthropology and the Discipline of Historical Context', *Midland History*, 13, Spring 1972.

50 See, for example, Stuart Clark, 'French Historians and Early Modern Popular Culture', *Past and Present*, No 100; Carlo Ginzburg's preference for the concept of 'popular culture' as against the non-class implications of 'mentalities', in "The Cheese and the Worms", op cit, pp xxiii-xxiv, and the anthropologist Michael Gilsenan's comment that "the different interpretations of and selections from an essentially common body of myth within a society or cult are historically quite critical", 'Myth and the History of African Religion', in T O Ranger and J N Kimombo, ed, "The Historical Study of African Religion", London, etc, 1972.

51 Ramakrishna by virtue of his caste status could never have been a working peasant, but his lack of formal education made him a participant of the folk culture of the peasantry.

52 Mahendranath Gupta, *Sri Sri Ramakrishna-Kathamrita* (henceforward K) 5V, Calcutta 1902-1932, Volume V, p 44, June 2, 1883, My translations, from the 1980-82 edition.

53 K IV, pp 11, 68; KV, p 104.

54 K II, p 2, (October 16, 1882).

55 K IV, p 101, (June 20, 1884).

56 K II, p 49, (June 4, 1883).

57 K IV, pp 254-5, (September 1, 1885).

58 Instances abound: see, for example, K II, p 63 (June 15, 1883); K III, pp 82-3, 190-191, (June 30, 1884, May 9, 1885, June 13, 1885), K IV, pp 11, 67-8 (February 25, 1883, February 2, 1885). Note the contrast between the troublesome *amla* and the distant overlord who can be reached directly through devotion, evocative of peasant dreams in so many countries of the just king or 'little father' of the poor.

59 K I, p 121, (June 15, 1884).

60 E P Thompson, 'Time, Work-Discipline and Industrial Capitalism', *Past and Present*, No 38, December 1967.

61 It may not be irrelevant to mention here that Mahendranath Gupta, who kept the record later published as the *Kathamrita*, was a school-teacher who encouraged his pupils to cut classes to come to Ramakrishna. He was dismissed later by Vidyasagar for neglecting his school duties.

62 The text is a valuable source also for explaining gender relations, for instance. For a detailed analysis of the *Kathamrita*, see my "The Kathamrita as a Text: Towards an Understanding of Ramakrishna Paramhansa", Occasional Paper, Nehru Memorial Museum and Library, New Delhi, 1985.

63 James M Freeman, "Untouchable: An Indian Life History", London, 1979, p 354.

64 Thus Ranke's sublime faith in the total impartiality of historians was still being echoed by scholars like R C Majumdar in the 1960s: the Anglo-Saxon vogue of economic history of the 1930s, reached India about a generation later; French structuralism has just started affecting some of us.

# Administered Interest Rates in India

L M Bhole

*The rate of interest is an important price in any economy. If it is determined mainly by the market forces, it may help in taking appropriate decisions about saving, investment, allocation of resources, financial and monetary policy, etc. However, the level and structure of interest rates in India have remained very closely regulated by the authorities. The present study examines the working of this administered system of interest rates, and discusses the issues and considerations which need to form the basis of future interest rate and monetary policies for the Indian economy.*

THE plan of the study is as follows: In Section I, after stating the background and the content of the present system, we briefly refer to the nature, criteria, and feasibility of an alternative system of interest rates which, according to us, would be appropriate for India. Section II discusses the features and rationale of the present system by reconstructing its scope, techniques, authority, timing, and its effects on interest rates and credit control mechanism. The reasoning and empirical evidence in support of the case for an alternative system are presented in Section III. The lessons from experiences of some countries in operating the similar systems of controlled interest rates are mentioned in Section IV. Summary and conclusions are presented in Section V.

## I

## The Background and Anticipatory Remarks

The performance of the Indian economy during the past three decades of economic planning has been far below the needs and expectations. There has been ratcheting upwards of inflation and unemployment accompanied by near stagnation in the rate of growth. It has been characteristic of the Indian economy that instead of experiencing 'trade offs' between different economic objectives, there has been a deterioration on all fronts. All this has happened in spite of the adoption of economic planning, and a fairly high rise in the rates of saving and capital formation. Such a poor outcome of our tryst with destiny is naturally making many a people restless and compelling them to seek solutions to the predicament just described.

To the extent the monetary and financial factors are relevant in economic development, efforts are being made to understand better the working of the Indian monetary system so that appropriate policies can be devised for maximising its contribution to the development process. Among other things, a clear consensus is now emerging in favour of the urgent need for an increase in the productivity of investment in place of the earlier emphasis on the increase in merely the quantum of investment. Everybody now appears to be concerned about the high and increasing capital-output and capital-labour ratios, widespread low rates of utilisation of the already existing production capacities, unduly long lags between investment expenditures and flows of output, and the misuse of capital in other ways.

It is in this context that we have undertaken a comprehensive review of the working of the present interest rates policy in India in all its major aspects. Over the period of time, more and more interest rates have been brought under more and more detailed administrative and discretionary controls. As a result, the system with the following characteristics has evolved during the past many years: (i) The rates of interest have been kept at unnaturally low levels. (ii) The regulation of one interest rate has led to the regulation of another rate. In other words, a ceiling on one interest rate has begotten another ceiling. For example, the regulation of banks' lending rates has necessitated the regulation of their deposit rates; and the latter, in turn, has forced the regulation of interest rates on deposits with non-banking companies. (iii) Because the interest rates have been controlled and kept low, the need has arisen for the imposition of widespread and detailed quantitative ceilings or restrictions as a means of allocation or distribution of finance and fighting inflationary pressures. Thus, the system of administered interest rates comprises the presence of discretionary controls on the level and variations of interest rates, the maintenance of these rates at lower levels than what they would otherwise have been, and the existence of the quantitative restrictions on the disbursements of credit.

We have attempted to establish in this study a connection between this sytem and the financial and real performance of the Indian economy. It has been argued, with some empirical evidence, that it has resulted in an inappropriate saving and investment behaviour, maldistribution of financial resources, the accentuation of the problems of inflation, unemployment, etc, and the weakening of the effectiveness of monetary policy. Therefore, a case has been made for freeing interest rates from the administrative controls, and for the need to establish their appropriate level which at present would be much higher than what it has been so far. It is not a case for usurious or exhorbitantly high interest rates, but for 'appropriately' or 'correctly' high rates of interest. In doing this, we are sharing the perspective developed in this respect by Myrdal, Shaw, Mckinnon, and Brahmananda,[1] and restating the case for free and higher interest rates. This restatement may be regarded as valuable and useful because it is far more comprehensive, up-to-date, and based on empirical evidence from the Indian economy as never before.

The system of administered interest rates is a special case of the wider system of prices and physical controls which have come to pervade most of the developing economies. It is hoped that our analysis would be useful in re-evaluating the utility and advisability of the continuation of these other controls also.

Before we proceed to explain our position, it is necessary to refer briefly to the criteria which can help to determine the appropriateness or otherwise of a given system of interest rates, what are the alternative systems which can take the place of the present system, and the feasibility of the system chosen from them.

In a wider sense, the objectives of economic planning should serve as good criteria for judging the suitability of any given sub-system in the economy. However, from the point of view of the immediate relevance and concern, given the capital scarcity, interest rates policy should be such (a) that savings are adequate, and they are held in forms which are conducive for both their use in the growth process and control by monetary authorities for the purpose of economic stabilisation; (b) that available savings capacity is harnessed for investment in essential and productive purposes, and the efficiency of investment is maintained consistently at a high level. Interest rates should induce socially desirable allocation of resources and pattern of investment.

Stated slightly differently, interest rates system should be such as to help the financial system to adapt flexibly to the evolution of the requirements upon it, and to meet these requirements adequately and equitably so that individual groups of borrowers and lenders are not arbitrarily discriminated and disadvantaged, all the possible economies in administrative and other costs are realised, and the opportunities for corruption and arbitrariness are absolutely minimised.[2] The system should be simple and open also.

It is possible to think of at least three types of system of free interest rates: (i) a completely *laissez-faire*, (ii) a system in which the quantity of money is closely controlled by the authorities and interest rates are left to find their own levels as advocated by the 'monetarists', and (iii) a system of 'indicative' regulation of interest rates accompanied by the minimum of discretionary controls. It is this last type which we have in mind when we argue for free and flexible interest rates system for India.

A completely *laissez-faire* system of freely floating interest rates, without any type of government intervention in financial markets, is obviously unrealistic for India where formal economic planning has been of much higher degree and serious hue. At the same time, it is to be firmly grasped that it is equally unrealistic to expect that direct, discretionary, all-pervasive state intervention would help to deal with the imperfections in financial markets. A policy of discretionary controls to deal with market imperfections is a logical contradiction, it is a sure way of perpetuating imperfections, albiet from a different source.

The monetarists have been recommending that interest rates should be allowed to float freely in the markets, and the task of regulation should be performed by the Central Bank by fixing a monetary rule. It will be shown later how such a system is beset with certain practical operational difficulties because of which, apart from other weaknesses of the monetarist approach, the acceptance of such a system is also inadvisable.

Our plea, therefore, is for a system wherein, instead of fixing almost each and every interest rate, the authorities operate more through the instruments of monetary control—not this or that technique but a whole set of them used in a mutually reinforcing manner—such as the bank rate, open market operations, changes in the quantity of money, etc, to determine the market rates of interest and flows of money and credit. Such a system works through automatically functioning operational controls, and changes in interest rates therein are induced rather than administratively fixed There is, as Myrdal has pointed out, a far greater use of price mechanism and a very high degree of automatism, i e, people's behaviour is mostly guided by relative rates of cost and returns rather than administrative discretions. However, price mechanism is first adjusted, again mostly through changes in price signals under the control of authorities, so that now it provides the specific inducements and inhibitions which are 'correct' with reference to the goals and targets of economic policy.[3]

Such a system is quite feasible and in tune with the philosophy of economic planning. As, Oscar Lange has pointed out, the price system, including interest rates, is an important incentive serving to induce the private sector to do things required of it in the plan. But also in the public sector, the need for incentives exists which again requires a proper price system.[4] It may also be reminded that in the initial years of planning in our country, there was a clear preference for and emphasis on maximum reliance on the price mechanism and the minimum use of physical controls for implementing economic plans. It is, therefore, a misconception that planned or socialistic countries need to keep interest rates low and operate through a maze of discretionary controls. The over-reliance on the present system of interest rates is an aberration which definitely needs to be corrected sooner than later.

## II

## The Reconstruction of the Present System—Its Features and Rationale

### EVOLUTION, SCOPE, TECHNIQUES, ETC

A large variety of interest rates exists in any economy at any given time. For example, in India, there are deposit rates of commercial banks, co-operative banks, postal savings organisation, non-banking companies, then there are lending rates of these and term-lending financial institutions; further, there are rates on industrial and government securities. All these rates can be classified as loan rates and rates of return on savings (in case of 'direct securities', loan and savings rate are the same) or as short-term and long-term rates. Under perfect competition, the respective levels of all these rates, and the interrelationships between them (i e, their structure) would be determined on the basis of market forces reflecting productivity of borrowed capital, risk and uncertainty, premium for abstinence and liquidity preference, maturity, time preference, etc. The various degrees of imperfections in the money and capital markets would modify the rates but they would still be determined mainly by the market forces.

Under the administered interest rates system the interest rates are fixed or made to rule at a given level through fiat or discretionary administrative controls with almost no reference to the factors embodied in the supply of and demand for funds. Such a system has now come to prevail in India, through gradual evolution over the period of time. Till about 1958, all the interest rates were more or less free; in the month of October of that year, however, a ceiling on the deposit rates of commercial banks was introduced through the voluntary agreement between some Indian and foreign banks. Under this agreement, a separate maximum rate was fixed for deposits of different maturities. Even then, there was a great deal of flexibility and variations in the deposit rates paid by different banks which were party to the agreement; the rates paid by other banks naturally differed from one another, and from the banks bound by the agreement. This system lasted for six years.

In September 1964, it was replaced by the regulation of deposit rates by the RBI in terms of the Banking Regulation Act, 1949. With this change, the system of regulation became more general and it involved, unlike previously, the fixation of both the minimum and maximum rates. Under this system which continues to prevail now also, while the maximum rate is prescribed on deposits of maturities upto 90 days, the minimum rate is prescribed on deposits of maturities beyond 90 days. In practice, the minimum and maximum rates have mostly turned out to be the fixed rates actually paid by the banks on respective maturities, i e, no bank pays less than the maximum or more than the minimum rates stipulated by the RBI.[5]

The deposit rates of co-operative banks came under the perview of these regulatory measures not until 1974. Since then, co-operative banks also have been paying on their deposits interest rates prescribed by the RBI. They are now allowed to pay interest rates which are higher by certain percentage point(s) (normally, one-half of one per cent) over the rates prescribed for the respective maturity of deposits of commercial banks. As a result of this policy interest rates of commercial and co-operative banks have come to be linked, and changes in them have been effected simultaneously since 1974.

The lending rates of commercial banks have also been controlled by the RBI in terms of the Banking Regulation Act, 1949 since 1960 in the form of prescribing minimum, maximum, dual, and differential interest rates. It prescribes different minimum and maximum rates depending upon the size of banks, the size and purpose of advance, the type of borrower, the nature of security, etc. Similarly, there are separate minimum rates for the general credit and the advances under the selective credit controls, respectively.

The lending rates of co-operative banks were regulated indirectly or through 'suasion' till 1980. As co-operative banks, at all levels of their three-tier structure, depend on the RBI for concessional financial resources, while they were always 'expected' to charge only the 'reasonable' rates to the borrowers from the agriculture and allied activities, in case of finance for production and marketing activities of the cottage and small-scale industries, the terms of concessional refinance stipulated certain conditions about the rates to be charged by them to these borrowers. In 1980, the loan rates of co-operative banks also came to be statutorily regulated and now all the lending rates of these banks are under the direct statutory control of the RBI.

Interest rates on deposits accepted by non-banking non-financial companies, and non-banking financial and miscellaneous companies, which were completely free till recently, have become subject to a ceiling fixed by the Government of India and the RBI, respectively with effect from the beginning of the financial year, 1981-82. There are certain notable points about this regulation. Firstly, unlike in the case of bank deposits, in place of different ceiling rates for deposits of different maturities, there is only one ceiling rate which is stipulated, and the companies are free to pay any interest rate upto the ceiling irrespective of the maturity of deposits. As a result, the companies have a greater degree of flexibility than the banks in respect of the mobilisation of deposits. Secondly, while the cost of deposit-resources of non-banking financial companies is regulated, their lending rates, unlike banks, are not subject to regulation. This also puts such companies in a favourable position *vis-a-vis* banks.

There is a ceiling on the level of call rate also which is imposed by the Indian Banks' Association since 1973. Interest rates on post-office saving bank, time, and other deposits, other small savings media, Treasury bills and government dated securities are all directly fixed by the Government of India. Interest rates on industrial debentures and dividends on preference shares are subject to a ceiling prescribed by the Controller of Capital Issues. The loan rates of the statutory financial institutions, although not subject to any direct control, also can be said to be regulated through 'suasion'. To the extent that these institutions supply credit to the public sector, small scale units, units in the backward regions, and for other priority purposes, their interest rates are bound to be influenced by the thinking of the authorities about the 'appropriate' cost of finance; and this influence must be strong because of the government ownership of these institutions. Similarly, institutions like IDBI impose ceilings on rates to be charged by the primary lenders who obtain refinance and rediscounting facilities from them. It is only the rates of return on ordinary shares and units, bazar bill rate, and hundi rate which appear to be free from any formal and direct control of the authorities in India.

Thus, almost every interest rate in India is now very closely administered in the form of fixation of either the specific, or minimum or maximum (ceiling) or dual or differential level by the government or RBI or Controller of Capital Issues or the Indian Banks' Association, etc, through the exercise of statutory powers or voluntary agreements or suasion. While the effect of such a policy on the behaviour of interest rates themselves is discussed in the following subsection, its wider effects on the economic activity as a whole will be analysed subsequently.

### Effects on Interest Rates and Credit Control Mechanism

Statistical series over a long period of time are available in India only for a few interest rates, although the situation here is probably not as bad as in many other developing countries. It may be mentioned here that the RBI used to publish only a few money rates of interest in its Annual Report on Currency and Finance till 1972-73; this practice underwent a welcome change with effect from 1974-75 when it started publishing data on many short-term and long-term interest rates in the 'Structure of Interest Rates in India' Table. But even now, this Table does not include information about interest rates on the post-office and other small savings media including provident fund, interest rates in the co-operative banking and credit structure, commercial banks' saving deposit rate, interest rate which the RBI pays on excess reserves, etc. This short-coming needs to be corrected. The

Table 1: Interest Differentials in India

| Rates on / Year | 51-52 | 55-56 | 60-61 | 65-66 | 70-71 | 75-76 | 80-81 | 81-82 |
|---|---|---|---|---|---|---|---|---|
| 1) TB-call money | 0.17 | −0.23 | −1.59 | −2.76 | −2.88 | −5.95 | −2.52 | −4.36 |
| 2) Bank rate (1 year) deposit | 1.46 | 0.95 | 0.56 | 0.0 | −0.38 | 1.0 | 1.0 | 1.5 |
| 3) SBI Advances (1 year) deposit | 2.27 | 1.45 | 1.56 | 1.50 | 2.87 | 6.0 | 8.5 | 8.0 |
| 4) Bank deposit: | | | | | | | | |
| i) (3-year)-(1-year) | — | — | 0.25 | 0.25 | 0.50 | 1.0 | 2.0 | 1.5 |
| ii) (5-year)-(1-year) | — | — | 0.75 | 1.0 | 1.25 | 2.0 | 2.0 | 2.5 |
| iii) (5-year)-(3-year) | — | — | 0.50 | 0.75 | 0.75 | 1.0 | 0.0 | 1.0 |
| 5) Debenture coupon (5-year) deposit | — | — | 3.0 | 0.0 | 0.75 | −0.5 | 3.5 | 4.0 |
| 6) 5 to 15 years government bonds (5-year) deposit | — | — | −0.62 | −1.74 | −2.67 | −4.25 | −3.73 | −4.59 |
| 7) Government bonds: | | | | | | | | |
| i) Medium term/short term | — | — | 0.24 | 0.11 | 0.48 | 0.12 | 0.9 | 0.54 |
| ii) Long term/medium term | — | — | 0.2 | −0.19 | 0.57 | 0.0 | 0.69 | 0.81 |
| 8) IDBI loans-SBI advances | — | — | — | 0.50 | 0.0 | −3.0 | −3.58 | −2.5 |
| 9) IDBI loans-Debenture coupon | — | — | 0 to −0.5 | 1.0 | 0.5 | 0.5 to 1.0 | 0.5 | −1.0 |

*Notes:* Deposits refer to commercial banks' fixed deposits; IDBI loan rate refers to its prime lending rate; TB is Treasury Bills.

behaviour of a few selected nominal and real rates of interest over the period of more than a hundred years (1870-1983) is depicted in Figures 1 and 2.

(i) It would be observed from Figure 1 that there has been quite a bit of increase in interest rates during the sub-period 1950-83, but the major part of this increase has occurred after 1974.[6] Incidentally, it may also be noted that there have been very few marked fluctuations in interest rates during this period. The American experience,[7] and our own in the past show that when interest rates are free, they tend to fluctuate much more in upward and downward directions.

An increase in interest rates just mentioned has been the result of periodic 'mark-ups' but we do not know how the authorities have, from time to time, decided upon the extent, frequency, timing, etc, of these 'mark-ups'. We do not have any enunciation from the authorities about the principles or considerations and the weightage given to them, which underlie their 'mark-up' decisions. It appears that decisions in respect of changes in interest rates are mostly being taken quite haphazardly, in an *ad hoc* manner, and inadequately. Consequently, the levels of interest rates, differences in different rates, and changes in both of these have usually not been related to the considerations of risk, liquidity, maturity, demand for and supply of funds, commodity prices, etc. The concept of adjacency of different financial assets in the sense of the existence of well-defined differentials in interest rates (returns) on them when they are arranged in the descending or ascending order on the basis of their major attributes does not appear to have much meaning in India (see Table 1). For example, it is difficult to understand why interest rates on time deposits of the same maturity with the post-offices and banks should differ much, and why such a difference, if it exists, should fluctuate greatly from year to year. The post-office deposits rates have been mostly higher than the bank deposits rates, and their difference has varied between zero to 2.0, and −0.5 to 2.75 percentage points in case of one to three-year, and five-year deposits, respectively during 1969-70 and 1981-82. Similarly, interest rates on small savings media have been higher than those on the government securities of comparable maturities. There is no reason why the coupon rates on the bonds of IDBI, IFC, EXIM Bank, etc, should be higher than those on government securities. While the lending rates of the EXIM Bank have ranged between 9 to 12 per cent, those of commercial banks have ranged between 4 to 18 per cent. The phenomenon of short-term interest rates exceeding the long-term rates unrelated to the cyclical swings in business activity is also to be explained in terms of the discretionary controls in this context.

TABLE 2: INTEREST RATES IN INDIA AND OTHER COUNTRIES

| Country | 1977 DR | 1977 MMR | 1977 GBY | 1981 DR | 1981 MMR | 1981 GBY |
|---|---|---|---|---|---|---|
| 1) India | 9.0 | 10.18 | 6.32 | 10.0 | 8.61 | 7.15 |
| 2) US | 6.0 | 5.54 | 7.67 | 12.0 | 16.38 | 13.72 |
| 3) UK | 7.0 | 8.06 | 12.73 | 14.0 | 13.29 | 14.74 |
| 4) Germany | 3.0 | 4.37 | 6.20 | 7.50 | 12.11 | 10.38 |
| 5) France | 9.5 | 9.22 | 9.61 | 9.5 | 15.26 | 15.66 |
| 6) Canada | 7.50 | 7.33 | 8.70 | 14.66 | 17.72 | 15.22 |
| 7) Sweden | 8.0 | 9.96 | 9.74 | 11.0 | 14.35 | 13.49 |
| 8) Italy | 11.50 | 14.03 | 14.62 | 19.0 | 19.60 | 20.58 |
| 9) Japan | 4.25 | — | 7.33 | 5.5 | 7.69 | 8.66 |

(ii) In spite of some increase, interest rates during the era of regulation can be said to have been artificially maintained at lower levels than what they otherwise would have been and what they should have been. The following theoretical and empirical evidence supports this viewpoint:

(a) The very objective of imposing discretionary controls has explicitly been to keep interest rates at lower levels as in the cases of deposit rates, rates on finance for fixed investment, rates on government debt and loans to the priority sectors, etc.

(b) Sometimes controls were introduced precisely when interest rates determined by the market forces reached the levels which were 'regarded' as 'unduly' high by the concerned authorities. In such cases, interest rates have been definitely kept at lower levels through the imposition of ceilings. For example, the call money rate. The experience in other countries such as UK and US shows that whenever the policy of pegging of interest rates was abandoned, there was a sharp increase in those rates.

(c) The rates which have not been subject or amenable to regulations have been consistently higher than the controlled rates. For example, the bazar bill rate, SBI hundi rate, and other rates in the unorganised sector of the financial markets.

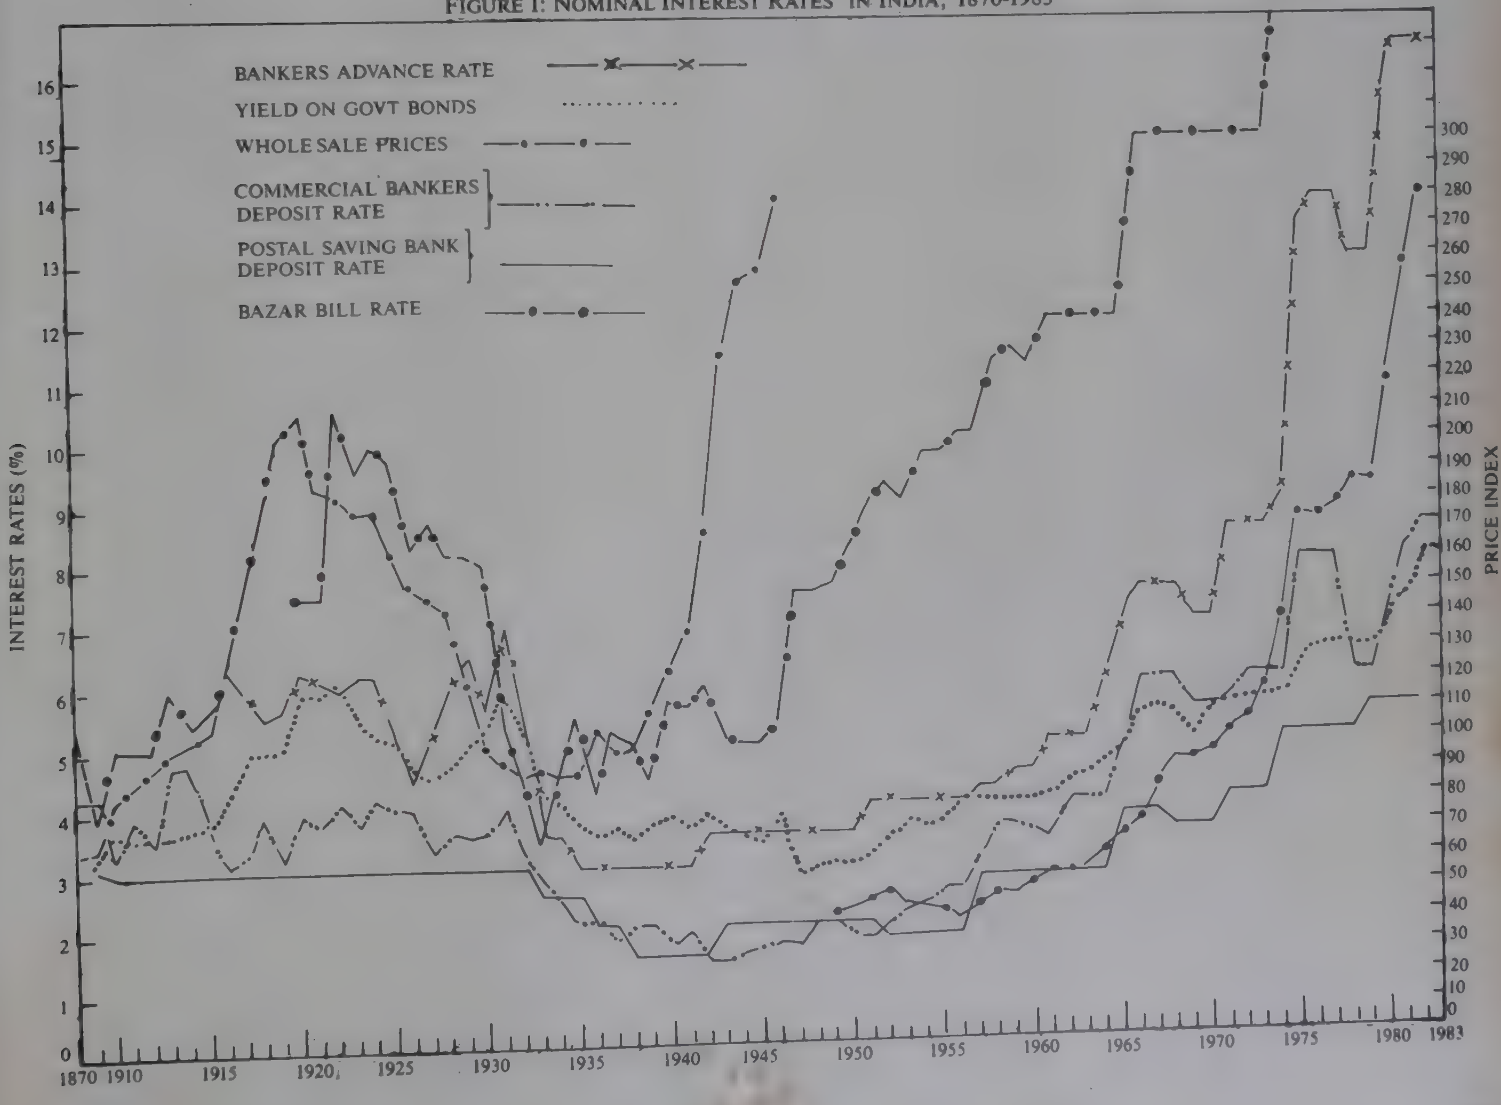
(d) While judging whether interest rates in a given period are high or low, they have been very often compared with their historical level. The application of the idea of historicism to interest rates has given rise to notions such as the 'band of feasible rates'[8] or the 'gears of interest rates'.[9] It is argued that there is some 'normal' level of and changes in interest rates the idea about which can be obtained from the level of and changes in interest rates which occur in quiet times and which are consistent with the maintenance of organised markets. The rates of interest cannot rise or fall in any given period very far from this 'normal' level, except for a brief period. Some people in India have conveniently and successfully made a case for lower interest rates on the basis of such notions. They have argued that interest rates in the post-independence period have been higher than their historical level, and, therefore, they should be (further) reduced.

The current interest rates policy cannot be determined mainly on the basis of a historical approach because it is a static one. But even by historical standards, interest rates in India have been held at lower levels after 1950. It would be clearly observed from Figure 1 that excepting the period of 1933-50,[10] banks' advances rate, for example, has been lower during 1951-70 and only slightly higher during 1970-75 than its own level during 1870-1933. The same thing is also more or less true of other controlled rates such as banks' deposits rates, government bond yield, etc. These rates can justifiably be deemed to have been effectively still lower (than what data show) if we take into account, as we must, the fact that the expected or planned rates of economic growth and capital formation have been far higher after 1950 than in the historical period. While the rate of gross capital formation during 1861 to 1929 was about 5 to 7 per cent,[11] it was about 12 to 20 per cent during 1951-75. If the relevant factors such as the relative demand for credit and finance, the size of government borrowing programme, deficit financing, balance of payments difficulties, the rate of inflation, etc, were freely allowed to influence interest rates, the latter would have been much higher than their historical as well as current levels. Further, if the history of interest rates is important, how can we forget the history of interest rates in the unorganised and semi-unorganised sectors of the economy?

(e) If the interest rates are not administered, the secular and cyclical changes in the commodity prices act as a major determinant of variations in the nominal interest rates so that the real interest rates maintain appropriate positive levels. As it would be seen in Figure 2,[12] the real rates of interest in India during the post-1950 period have been mostly negative; and whenever they were positive, they were mostly around the low level of 2 to 4 per cent per annum.[13]

It is likely to be pointed out that the real rates of interest were negative in the earlier period also when the rates were not controlled. It has to be accepted that whenever the rate of inflation has been very high (around 25 per cent and above), it has not been possible for the nominal interest rates to keep pace with such price changes even though there were no controls on their movements. This long-term experience in India suggests that the Fisher effect may not be observed in the period of hyper-inflation, and the principle stated in the previous paragraph may be valid only in periods of normal mild inflation. Having accepted this, it may still be noted that before 1951, real interest rates were negative only during war-years;

FIGURE 1: NOMINAL INTEREST RATES IN INDIA, 1870-1983



they were positive and at quite high levels (after 10 to 18 per cent) in many other years. Thus, it is possible to explain, at least partly, negative or low-positive levels of real interest rates in the planning era in terms of discretionary controls on their movements.

(f) The interest rates in India have tended to be lower than in many other countries. Subject to the imperfections of international comparison of interest rates on account of differences in the nature of financial assets, definition, financial organisation, etc, it is clear from Table 2 that interest rates in India have often been maintained at much lower levels than in capital-abundant countries such as US, UK, Canada, France, Germany, Sweden or countries with similar inflationary experience, *viz*, Italy or countries with similar controlled interest rates systems, *viz*, New Zealand and South Africa. In the light of this evidence, the argument sometimes heard in certain quarters that India is a country with the highest interest rates can be said to be politically motivated.

(iii) Apart from maintaining interest rates at low levels and haphazardly determined differentials, the present policy has resulted in the sacrifice of the simplicity in the working of interest rate mechanism. The authorities have had to administratively announce the fixation of an unbelievably large number and vast range of interest rates. We have not one but a band of bank rates, we also have a large number of bank deposits and advances rates directly fixed by the authorities. The interest rates structure has consequently assumed an exceedingly complex and unmanageable character—the fact which has now been admitted by the RBI itself. The so-called simplification which it introduced in March 1981 is nothing more than tinkering with the existing system[14] because it has completely retained the principle of direct fixation of almost every single interest rate in the economy.

(iv) The direct administration of interest rates has been progenitive of a complex system of quantitative credit controls or ceilings as a means of monetary policy and distribution of available finance among different borrowers, sectors, uses, etc. The controls on the price of finance have begotten controls on the quantity of finance also. From the point of view of the monetary policy, the system has been caught in a vicious circle—the discretionary controls on interest rates have led to the need for imposing quantitative credit ceilings or targets which, in turn, have resulted in the atrophy of those techniques of monetary control which are appropriate for and consistent with the competitive, efficient, and dynamic financial organisation, and this has further perpetuated the dependence on the quantitative or physical or selective or discretionary techniques of monetary control.

## THE RATIONALE OF THE PRESENT SYSTEM

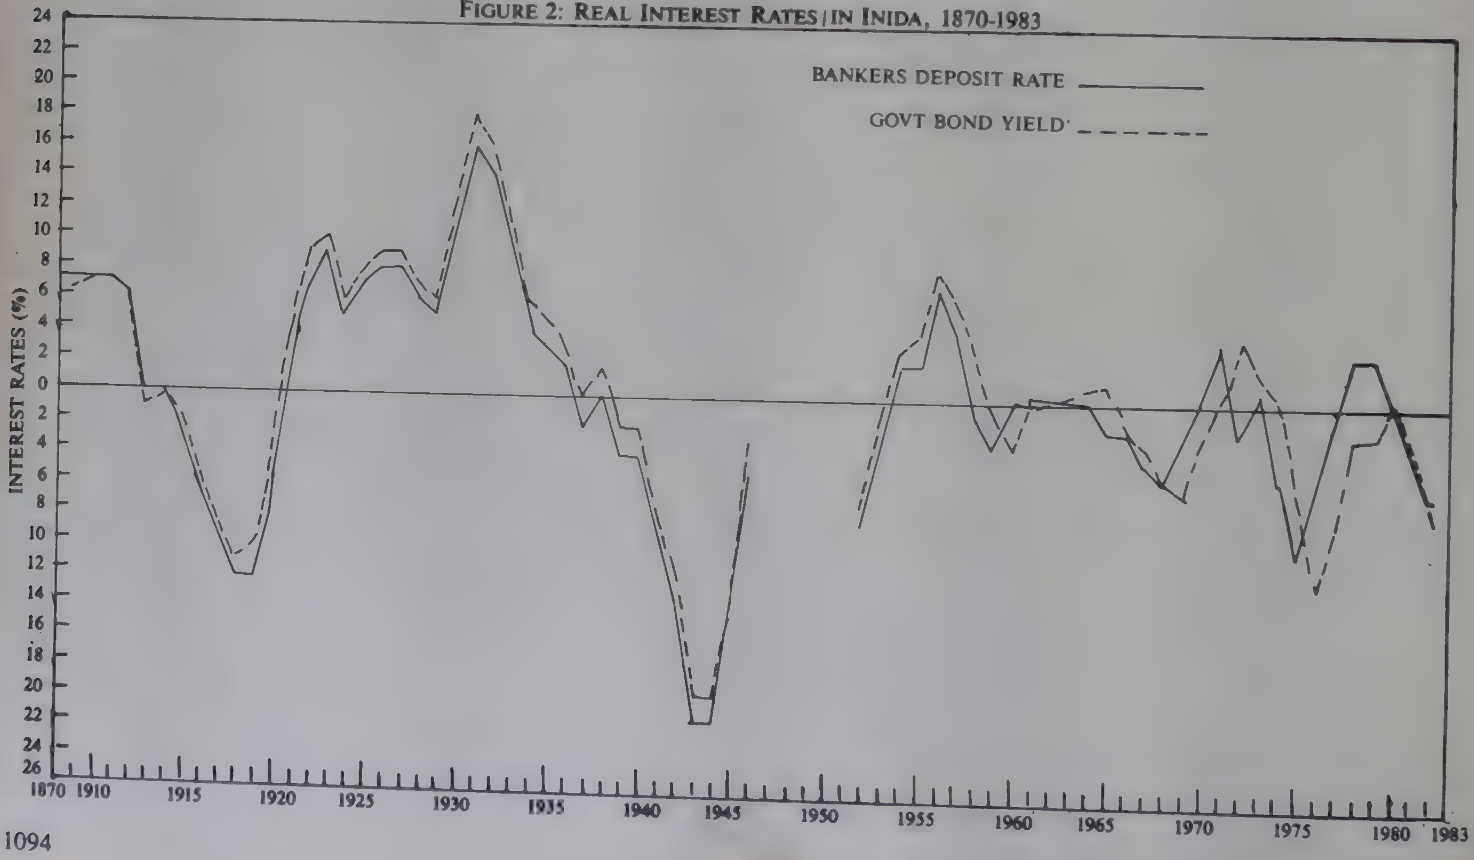
Why have the authorities here and elsewhere imposed controls on the level and movements of interest rates? Before we discuss the considerations which prompt such an action, let it be noted that usually it is the result of a fear that otherwise interest rates would be much higher than 'desirable'. In other words, the direct regulation of interest rates is mostly resorted with a view to maintain them at low levels which, in turn, are regarded necessary for certain reasons. In such cases, the reasons for keeping interest rates low and for administering them tend to coincide.

The present day policy of controlled interest rates can be said to have been historically preceded by the anti-usury laws which either completely prohibited the charging of any interest or which sought to control it to a particular level. Such a policy was largely based on the moral and other extra-economic considerations, while the present day policy has come to depend upon quite a complex set of arguments for its introduction and continued existence.

(i) In many developing countries including India, low interest rates have been regarded desirable in order to induce a higher rate of capital formation, particularly fixed capital formation. This explains why the long-term interest rates have been kept at such low levels. The belief in the theories of economic development which give paramount importance to the high rate of capital formation as the most critical development factor has shaped such a policy.

It is curious that while one view has

FIGURE 2: REAL INTEREST RATES IN INIDA, 1870-1983



argued for low interest rates for encouraging investment (which implies interest-sensitivity of investment), another view has argued for the same policy because demand for investment and bank credit is said to be inelastic to changes in interest rates. In more general terms, it has been argued that in developing countries, price incentives are weak and few people there calculate and take decisions in terms of cost and return. In such a situation, high interest rates merely lead to an increase in transactions, velocity of money, increase in difficulties of the productive sectors, particularly more vulnerable sectors such as small-scale industries, small borrowers, exports, etc, and increase in cost inflation. All this happens without curbing investment because, in sheltered markets, increased interest costs would be passed on to consumers in the form of higher prices.

(ii) The exigencies of government finance have perhaps constituted the most weighty consideration behind the actual adoption of the system of administered interest rates. In planned economies and welfare states, since the government and public sector are expected to play a very big role in economic activities, the financing needs of the government turn out to be on a huge scale. The government raises funds *inter alia* through the sale of government securities and small savings media. It is argued that if the interest rates are kept low and stable through controls, the cost of public debt would be low, and there would be a stability on the government securities market which is conducive for debt placement. Further, the Indian experience shows that under the present system, the government is in a position to manipulate rates in such a way as to induce the flow of funds in the media it desires to promote more. In the past few years, the Government of India has been paying higher interest rates on small savings than on comparable long-term marketable debt because thereby it can reduce the amount to be floated on the market which has certain inconveniences as compared with the non-marketable debt.

(iii) It is also argued that in a planned economy, the priorities and objectives of development are determined by the authorities. For example, they may desire to encourage exports, setting up of industries in backward or zero-industry areas, etc. If the course of development is to be in keeping with such priorities, the provision of credit with certainty and at low cost to the priority areas becomes necessary. This is achieved through the system of administered interest rates.

A related argument is that money and capital markets in economies like India's are characterised by varieties of imperfections. As a result, certain types of borrowers are discriminated against with regard to the availability, cost, and other terms of finance. In order to remove such discrimination against and disability of certain borrowers, the discretionary control of not only the cost but also the availability of finance becomes necessary. In a wider sense, such a policy is said to help to improve the distribution of income in favour of low-income and disadvantaged groups of society. The policies such as 'differential interest rates' have been adopted specifically for such a purpose.

(iv) Many reasons—sometimes quite contradictory to each other—have been advanced for controlling interest rates on bank deposits and advances. It is felt that if deposit rates are free, there may be unduly keen competition among banks for resource mobilisation which would increase their cost, reduce their profitability, and, in certain cases, lead to bank failures. Inter-bank agreement in India, Regulation Q in US, and inter-bank cartel in UK have been the result of such a reasoning. However, there has also been an another view that deposit rates of banks need to be regulated because otherwise they would reap exhorbitant profits by not raising these rates *pari passu* with an increase in their lending rates. The regulation Q also had the objective of limiting the expansion of bank credit which banks could bring about by the vigorous mobilisation of deposits by offering higher rates of interest.

In India, some of the reasons behind

TABLE 4: THE EFFECT OF INTEREST RATE ON INVESTMENT DECISIONS IN INDIA

*Notes:* Functions 1 to 5 and 6 to 10 are for total fixed investment and inventory investment, respectively; AV = Accelerator variable measured by Gross Domestic Product or Gross Public Sector Product or Sales; R = The long-term or short-term rate of interest; AC = Availability of Credit; PE = Price expectations measured by one-year lagged inflation rate; FE = Foreign exchange availability; TX = Tax factor; Figures in brackets are F-ratios; EE is Entire Economy; PS is Public Sector; PCS is Private Corporate Sector.

the control of deposit and lending rates of commercial and co-operative banks which have been officially mentioned[15] are: (a) To avoid unhealthy competition for both borrowing and deposit accounts. (b) To maintain a kind of uniformity of interest rates on these accounts of all types of banks. (c) To keep deposit rates in alignment with the lending rates of banks and with other market rates of interest. (d) To aid deposit mobilisation. (e) To lengthen the maturity structures of deposits by widening the spread between the long-term and short-term rates of fixing the minimum rate(s) for long-term maturities and ceiling rate(s) for short-term maturities. (f) To impinge upon both the demand for and supply of bank credit. While the prescription of minimum lending rates was meant to ensure that increases in RBI refinance/rediscount rates were transmitted to the ultimate borrowers, the ceiling rates were expected to discourage banks from borrowing more from the RBI because now they would not be in a position to transfer higher refinance cost to the borrowers. (g) To enable the authorities to avoid frequent changes in the bank rate and to achieve the results of changes in the bank rate by changing deposit and lending rates directly.

It may bear repetition to say that the case for regulation of rates being considered here involves contradictions. The deposit rates are to be allegedly regulated because the free rates would both reduce and increase banks' profitability; the regulation would both increase and decrease the deposit resources of banks; the regulation of lending rates would both ensure and hamper the transmission of higher refinance cost to the ultimate borrowers.

(v) It has been argued that when interest rates are free, changes in monetary techniques such as discount rate, open market operations, etc, might not bring about any material changes in the entire interest rates structure or they may be accompanied by undesirable movements in the market rates. It is pointed out that the authorities lack empirical evidence about the extent and direction of changes in market rates when the traditional techniques of monetary control are employed. In other words, the effectiveness and predictability of monetary measures are very limited when interest rates are free. On the other hand, if the market rates are changed directly with or without changes in the bank rate, etc, the effect of such a policy on the economic activity would be greater and more certain. In short, the administered system of interest rates allegedly enhances the predictability and efficacy of monetary policy.

TABLE 5: CAPITAL-OUTPUT RATIOS IN INDIA AT CONSTANT (1960-61 = 100) PRICES

| Period | Average C/O Ratio | Incremental C/O Ratio |
|---|---|---|
| 1950-54 | 2.50 | 3.51 |
| 1955-59 | 2.71 | 4.85 |
| 1960-64 | 2.92 | 3.28 |
| 1965-69 | 3.43 | 5.41 |

| 1975-77 | 4.20 | 6.42 |

*Note:* The Figures are averages for the respective periods.

*Source:* Rao, V K R V, op cit, p 154.

We shall examine the foregoing arguments and discuss our case for free and higher rates of interest in the next section. It may only be noted here that these arguments suffer from a lack of consistency, and they largely arise from beliefs in certain theories of economic development which are quite questionable, profession of the philosophy of planning and socialism, distrust of market forces due to the alleged existence of imperfections and low price elasticities, presence of multiple vested interests, and simply myopia.

## III

## The Case for an Alternative System

The reconstruction of the system of administered interest rates—designated by some as the system of "financial repression" or the one lacking "financial deepening"—has highlighted some of its defects and has indirectly shown the need for "financial reform" by replacing it with the system of free and higher interest rates. We now develop this subject further by discussing directly the beneficial effects of the alternative system on various spheres of economic activity such as the volume and pattern of savings, efficiency of the financial system, efficiency of investment and allocation of resources, efficacy of monetary policy, and by showing the weaknesses of some of the arguments which have been advanced in support of the existing system. While doing this, in addition to presenting qualitative arguments, we have attempted to furnish econometric evidence on a few major relationships or propositions posited in Shaw and Mckinnon model referred to earlier. However, given the nature of the subject-matter, the discussion has to be primarily qualitative. This has been shown by the lack of success of the attempts of Fry[16] and Galbis[17] to estimate this model for the Asian and Latin American countries, respectively.[18] In order to indicate the relevance of the econometric part of our study, it would be useful to state here for ready reference the gist of this model, and the hypotheses to be tested by us.

It has been argued that savings at a given level of income are a function of the real rate of interest, and administratively determined nominal interest rate holds the real rate below its equilibrium level. This holds saving and investment below what they would be at high real rate of interest. The ceiling on interest rates also results in non-price rationing of investible funds. The raising of nominal interest rates increases saving, investment, and the average efficiency of investment. This leads to increase in income and further increase in saving. The impacts of such a policy on growth are multiplicative. Accordingly, we shall test the following hypotheses:

(i) The rate of saving is expected to be positively related to the rate of interest. If this is empirically validated, the case for higher interest rates becomes strong provided the objective of economic policy is to increase the rate of saving.

(ii) Normally, the rate of interest is expected to be negatively related to investment. When this happens, investment decisions are taken on the basis of rational cost considerations and the efficiency of investment is high. But in the economy with the system of administered interest rates, since interest rates are kept low, they may be positively related to investment. If this is found to be true, it would mean that investment activity and the allocation of capital are not being conducted in an efficiency manner.

(iii) It follows from (ii) that the capital formation in low interest economies would be found to be playing an insignificant role in the determination of national income.

(iv) The low rates of interest result in low rates of economic growth.

Empirical results of the testing of these hypotheses would be reported at the appropriate points in the discussion of our case to which we now return.

### PROMOTION OF SAVINGS

In developing countries, there is definitely a case for higher interest rates because they play an important role in raising the rate of savings, and in the institutionalisation or financialisation or activisation of those savings. The strength of this argument depends upon the magnitude of interest elasticity of savings. We, therefore, estimated a few savings functions for the entire Indian economy for the period 1951-52 to 1979-80 the two of which are reported below:

$$\begin{aligned} GSR = 5.61 &+ \underset{(1.696)}{0.0671}\ GDP + \underset{(7.28)}{0.0048} \\ & PCGDP^{*} + \underset{(6.52)}{0.7987}\ R^{*} - \underset{(4.67)}{0.155} \\ & PE^{*} + \underset{(0.834)}{0.187}\ GSR_{-1} \qquad \ldots (1) \\ & \bar{R}^2 = 0.89008;\ D\ W = 2.13469 \end{aligned}$$

$$\begin{aligned} GSR = 5.11 &+ \underset{(5.78)}{0.0042}\ PCGDP^{*} \\ &+ \underset{(5.749)}{0.7576}\ R^{*} - \underset{(3.022)}{0.1129} \\ & PE^{**} + \underset{(2.218)}{0.2868}\ GSR^{**}_{-1} \qquad \ldots (2) \\ & \bar{R}^2 = 0.88689;\ D\ W = 2.11339 \end{aligned}$$

Where, GSR is the gross saving rate; GDP is the growth rate in gross domestic product; PCGDP is the per capita GDP; R is the one-year deposit rate of interest; PE is the measure of price expectations; $GSR_{-1}$ is the one-year lagged dependent variable; figures in brackets are F-ratios; all variables are in nominal terms; the functions are in non-logarithmic form; * and ** indicate the level of significance at 1 to 5 and 10 per cent, respectively.[19]

It would be seen that these fits are very good and the rate of interest has quite high and significant coefficient; it may be noted that the performance of rate of interest is better than that of income. This and the fact that the price expectations are shown to discourage savings strongly suggest the need for a higher interest rates policy in India.

It may be counter-argued that this is unnecessary in view of the good savings performance of the Indian economy in the past 30 years. The rate of gross savings has increased substantially over this period from about 10 per cent in 1951-52 to about 21 per cent in 1979-80. It may be argued that if interest rates in India are regarded to have been low, they have apparently not discouraged people from saving. We feel that this is an euphoric view of the matter, and it would be harmful if interest rates are continued to be kept low on the basis of such a reasoning. There are many other important features of savings behaviour in India which show the need for an increase in the reward for savings in future. Table 3 contains an useful information on some of these aspects of savings in India.

Firstly, it is necessary to note the time profile of an increase in the saving ratio. While it took as many as 20 years to increase by merely six percentage points during 1950-51 to 1969-70, it increased by 2.48 and 5.20 percentage points during the next two five-year periods, respectively. Thus, if we exclude the last ten years of the period under discussion, particularly the last five years which experienced a substantial increase in interest rates, the rate of growth in saving in India has been very small indeed.

The two other major factors, apart from an increase in interest rates, which have contributed to a substantial increase in the saving rate during 1970s have been the phenomenal increase in the number of bank branches and the amount of foreign remittances. From the point of view of the future, while the contribution of one of them is subject to a high degree of uncertainty and fluctuations, that of the other has almost reached its limit. Therefore, it has been rightly pointed out that we cannot take for granted the continuing increase in the rate of saving in the last quinquennial period and the establishment of a trend rate of growth which includes this period.[20] In such a situation, the offering of an attractive rate of return retains a crucial importance in the policy of promotion of savings.

Secondly, deposits with commercial and co-operative banks account for about half of total household sector savings in financial assets. Further, current account deposits constitute about 20 to 30 per cent of total bank deposits. Now, to the extent that a part[21] of the current account deposits is the result of created credit rather than genuine saving, the figures on saving ratio in India need to be adjusted downward to obtain a realistic estimate of the level of genuine savings in the country.

Thirdly, in spite of good progress in the institutionalisation of savings so far, there is still a great scope for further progress in this respect. The proportion of household saving in the form of currency is still quite high; it has been around 18 to 26 per cent of total household saving. Similarly, the physical assets still account for about half of total household saving. If this preference for idle saving is to be reduced, the return on financial assets must become attractive both in nominal and real terms.

Fourthly, the contribution of the corporate sector in this context has been extremely poor. Its saving rate has been about 0.5 per cent, and its contribution to total saving has declined from 7.91 per cent to 3.26 per cent over the period under study. The easy availability of cheap credit from banks and term lending financial institutions has definitely been one of the important causes for this poor savings performance of the corporate sector. The estimation of the determinants of saving of the Medium and Large Public Limited Companies (equation 3) and Medium and Large Private Limited Companies (equation 4) shows that, given the profits after tax or cash flow, while the companies have disregarded interest rate (which has the wrong sign) as a relevant factor, they have changed their retention policy in the light of the availability of external funds.[22]

$$\begin{aligned} RR = 33.99 &+ \underset{(27.84)}{2.65\ PAT^{*}} + \underset{(0.931)}{0.07\ FWI}\ R \\ &- \underset{(0.23)}{0.06\ ES} - \underset{(0.10)}{0.68} \\ &- \underset{(0.64)}{0.14\ P} + \underset{(0.34)}{46.57\ T} \\ & \bar{R}^2 = 0.9645 \qquad \ldots (3) \end{aligned}$$

$$\begin{aligned} RR = 82.52 &+ \underset{(14.5)}{11.98\ CF^{*}} - \underset{(4.16)}{1.10\ FWI} \\ &- \underset{(10.82)}{3.77\ ES^{*}} - \underset{(0.03)}{0.77\ R} \\ &+ \underset{(5.98)}{0.23\ P^{*}} + \underset{(4.53)}{2.21\ T^{*}} \\ & \bar{R}^2 = 0.8977 \qquad \ldots (4) \end{aligned}$$

Where, RR is the retention ratio; PAT is profits after tax; CF is the cash flow; FWI is the investment in fixed and working capital; ES is the external sources of funds, R is the debenture yield; P is the price level; T is the time variable; figures in brackets are F-ratios; functions are in nominal non-logarithmic form; and the period of study is 1961-62 to 1974-75.

Finally, in spite of a substantial increase, can we say that the rate of saving in India has been at the required level? If it was so, there would not have been the need for so heavy and increasing dependence on foreign capital, credit creation, deficit financing, and the credit rationing on a continuous basis. It is true that a greater efficiency in the use of financial resources and physical capital would have reduced this dependence. However, as we shall show, the level of efficiency just referred to also has been low partly on account of lower interest rates. Thus, higher interest rates become necessary both to increase (or to maintain) the rate of saving and to improve the efficiency of investment. If the former alone occurs unaccompanied by the latter, it involves a permanent sacrifice for the consumers because savings then do not contribute to the acceleration of the growth of income.

## EFFICIENCY OF THE FINANCIAL SYSTEM

The present system has been promotive of inefficiency because the interest rate mechanism as an impersonal, neutral, and anonymous allocator of finance has been replaced by the arbitrary and discretionary means of doing the same. The command over financial resources now depends upon the ability to offer security, political pressure, the bigness of size and ability to outmanoeuvre both other seekers of credit and credit controls, benefits to the loan officers, etc. The resources allocated in such a manner are very often used for either low-yield safe investments or for socially less useful or even detrimental purposes. There is also very often an over-capitalisation of units. The reality of this point is so well-established in India that we need not further belabour it here. The evidence accumulated by, among others, the Dutt Committee, Dehejia Committee, Tandon Committee, etc, is enough to emphasise the need to change the present system.

It is high time to realise that imperfections in markets cannot be corrected by imposing a set of other imperfections merely because the latter emanate from the authorities. The misuse of the differential interest scheme, the appropriation of credit meant for a variety of small borrowers by the big borrowers through devices such as creating fictitious or linked (captive) small units, etc, point to the dangers of non-price rationing of credit. It is acceptable that some kind of action was necessary to help farmers, small village and cottage industries, other small borrowers in the face of market imperfections. But it could have been done within the ambit of the usual legal powers of the government, through 'suasion', and through creating certain 'counterrailing' institutions which functioned on the basis of normal economic and cost considerations.

The entire array of interventions by the authorities has led to the development of an inefficient financial system in an another way also. The ceiling on the bank deposit rates has adversely affected the growth of bank deposits. If there was no large-scale expansion of bank branches, it is doubtful whether banks would have experienced the rate of growth of deposits which they actually did (between 16 to 24 per cent per year) after nationalisation. On the other hand, deposits with the non-banking companies have grown at comparable or even higher rates in many years; these deposits have grown at the annual rate of 20 to 78 per cent during 1978-82; this rate perhaps would have been still higher if there was no ceiling on the amount of deposits which each company could accept. This along with the fact that the authorities had to impose a ceiling on interest rates on company deposits also shows that the policy of regulating bank deposit rates has been wrong. The new development in the making, i e, the entry of banks into a more complex and risky business of lease finance within the existing set-up or by setting up subsidiaries reflect banks' desire to bypass the existing regulations on them to provide funds to the corporate sector, and to benefit from the opportunities to lend at higher rates of interest.

The foregoing suggests that non-price credit rationing and ceiling on interest rates result in sub-optimal allocation of funds, the growth of financial institutions or arrangements which tend to divert the flows of funds from channels which are directly amenable to the supervision and influence of the Central Bank, reduction in the profitability of banks,[23] negation of the intentions of the authorities with regard to the sectoral distribution of credit, etc. The experience in the UK in this context has been very much similar. As pointed out by Johnson also, it is, therefore, necessary to reinstate price competition and high rates of interest on both sides of the balance sheets of banks, other financial institutions, and all the users of finance.[24]

### EFFICIENCY OF INVESTMENT

Interest rates policy has a very immediate and decisive influence on the volume and efficiency of capital formation and on economic growth *via* the former. It is natural that in an inefficient financial system like India's promoted by the system of administered interest rates, the process of capital formation should have been greatly wasteful. There is much incontrovertible evidence which establishes this point.

Firstly, investment decisions in India have not been affected by interest rates in the theoretically expected manner; because of the low level of interest rates, they have been positively related to investment. Our unprecedentedly comprehensive study[25] of the interest elasticity of different components of fixed and inventory investments in seventeen industries, the private corporate and public sectors, and the entire economy, during the period 1950-51 to 1977-78[26] and its sub-periods has proved this beyond doubt. A few of a large number of investment functions estimated by us which have been presented for ready reference in Table 4 clearly show that interest rate is mostly positively related to investment, and it has been mostly insignificant statistically whenever it had the negative sign.

Secondly, it can be shown in different ways that an increase in capital formation has contributed little to fostering appropriate techniques of production and increasing labour employment; and that the creation of capital on a massive scale has not resulted in the commensurate growth of output. This is firstly reflected in the high and increasing capital-output and capital-labour ratios which prominently characterise the Indian economy. Accor-

TABLE 6: THE ROLE OF INVESTMENT IN THE GROWTH OF OUTPUT IN INDIA

| Sr No | Dependent Variable | Independent Variables | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | Intercept | I | MS | Time | Pop | $\bar{R}^2$ | D W | Functional Form |
| 1) | NDP | 4.41 | Eliminated | −0.071<br>(2.72) | 0.009*<br>(128.4) | — | 0.9911 | 2.13 | Log-nominal |
| 2) | PSP | 4.22 | −0.021<br>(0.05) | −0.092<br>(0.94) | 0.006*<br>(12.69) | — | 0.8838 | 1.65 | Log-nominal |
| 3) | SSP | 4.08 | 0.04<br>(2.62) | −0.21<br>(4.56) | 0.01*<br>(56.24) | — | 0.9836 | 0.69 | Log-nominal |
| 4) | GDP | −24.59 | 1.155*<br>(8.26) | −0.322<br>(2.22) | — | 8.27<br>(1.93) | 0.27197 | 2.40 | Non-log-nominal |
| 5) | GDP | 1.74 | −0.418<br>(1.62) | −0.011<br>(0.006) | — | 4.15<br>(0.799) | −0.016 | 2.19 | Non-log-real |

*Notes* :The functions 1 to 3 and 4 to 5 are for the period 1950-51 to 1975-76 and 1951-52 to 1979-80, respectively. NDP = Net Domestic Product; PSP = Primary Sector Product; SSP = Secondary Sector Product; GDP = Gross Domestic Product; I = Investment; MS = Money Supply narrowly defined; Pop = Population; Time = Trend variable; Figures in brackets are F-ratios.

ding to one estimate, the capital-labour ratio has increased from Rs 3,185 in 1950-51 to Rs 8,542 in 1980-81; the index of this ratio has increased from 100.0 to 268.0 during the same period.[27] Similarly, while the average capital-output ratio has increased from 2.5 during 1950-54 to 4.2 during 1975-77, the incremental capital-output ratio has increased from 3.51 to 6.42 during the same period (see Table 5).

The second way of showing the wasteful use of capital in India is to study changes in its productivity and that of other factors of production. Brahmananda has estimated that the index of net output productivity of capital has declined from 100.0 in 1950-51 to 68 in 1980-81. Further, on the basis of his study of rates of growth in total factor quantity, net domestic product, and total factor productivity in the Indian economy as a whole and in its various sectors during the planning era, he has shown that " . . . the contribution of improvements in total factor productivity to sectoral growth seems to have become less and less as we move from the first decade to the third decade . . . both traditional and modern activities seem to be losing the productivity growth momentum. The most distressing finding is that . . . registered manufacturing and mining, the two sectors on which huge amounts of capital have been invested, indicate a negative contribution from total factor productivity growth."[28]

In order to clinch this issue, we have estimated the sectoral and aggregate output functions to study the contribution of capital formation to changes in output. They are reported in Table 6. Investment is shown, except in one equation, to be an insignificant or irrelevant determinant of output. It is the trend element which seems to explain variations in output in India. Incidentally, it may be noted that changes in money supply also are irrelevant in this context.

In short, investment activity in India has been taking place irrespective of changes in interest rates. The capital allocation and labour employment decisions do not seem to have been governed at all by the criterion of optimality for production, employment, etc.[29] The productivity of capital has been low in spite of a very young capital stock in the economy barring traditional industries. The present interest rate policy must share the blame for this state of affairs in our country,

The high and free rates of interest would contribute in bringing about a change in this picture. They would lead to an efficient diffusion of modern technology in the sense that the extent relative factor abundance would be taken into account when new techniques are adopted through increased investment. Interest rates have a role to play in promoting employment and appropriate technology by discouraging premature modernisation or mechanisation not only in the industrial but also in the agricultural sector. In this context, while the adverse effects of low interest rates in the industrial sector are well-received, their similar consequences in the agricultural sector tend to be overlooked. It is to be noted that just as there is a need to wean savers and investors in rural areas from assets such as gold, currency, etc, there is also a need to wean the farmers who are already well to do and also whose cash flows are improving as a result of the adoption of new seeds and fertiliser technology away from the mechanisation of agriculture which positively displaces hired labour exacerbating the problems of unemployment and underemployment, i e which increases the social cost. Now, higher interest rates on financial assets would help here because the farmers would then find high-yielding alternatives from outside their own enterprises.

The importance of the role of higher interest rates in allocating resources economically and using them more efficiently or productively can be guaged or appreciated from the changing attitude of the authorities in communist countries to the relevance of interest rate policy there. On the basis of his study of the working of monetary systems in these countries, Wilczynski has evidenced that in the beginning, interest rates were virtually ignored in these countries as a weapon of economic policy. Budgetary allocations of finance to enterprises were made without any charge and where interest rate was charged, it used to be very low. This led to extravagant demands for capital, widespread hoarding, and underutilisation and a wasteful neglect of capital assets. However, the adoption of the intensive growth strategy (as distinct from the extensive one) which heavily depends upon increases in productivity of capital forced these economies to make interest rate an indispensable instrument of sound economic management. Accordingly, in the early 1960s, they introduced capital charges on enterprises and appreciably increased interest rates on saving bank deposits, consumer credit, bank credit to enterprises, and foreign credits.[30]

### EFFICIENCY OF MONETARY CONTROL

From the point of view of the working of monetary policy, the case for the abandonment of the present system and the replacement of interest rates as targets/indicators and instruments in its place rests on the following theoretical, operational, ethical and other grounds.

The monetary authorities in India have been using bank credit, money supply, bank borrowings from the RBI, seasonal return flows of funds, the growth of resources of banks and their being in 'liquidity blind', etc, as targets/indicators of monetary policy. They have not been in a position to make a conscious and active use of interest rates as targets/indicators because of the policy of administered rates. This has been inconsistent with their theoretical belief with regard to the transmission mechanism of monetary policy,[31] and it has severely undermined the effectiveness of monetary policy in India.

It may be possible to discard the use of interest rates as targets/indicators and instruments of monetary policy if one believes in the exogeneity of money supply, and if the money supply is, in fact, exogeneous. The monetarists do not, for example, bother about interest rates because they hold that the Central Bank can, by itself, completely control changes in money supply. In India, both the conditions just mentioned are not fulfilled. The monetary authorities here do not believe, and rightly so, that in the conduct of monetary policy, money supply alone matters and they can fully control its variations. Further, our empirical study of the process of money supply determination during the period fo 1950-51 to 1979-80 has clearly shown that money supply in India is not at all exogeneous.[32] It has, therefore, been both logically inconsistent and wrong on the part of monetary authorities to have rendered interest rates useless as targets/indicators and instruments of monetary policy, and thereby paved the way for the inefficacy of their own policy.

Under the present system, while maintaining that it does not believe in the monetarist approach to monetary policy, in practice, the RBI perforce has been paying almost exclusive attention to money supply and bank credit as targets/indicators of monetary policy. There are reasons why this system ought to be changed if the monetary policy is to be more effective than it has been so far. Notwithstanding its importance in the Indian monetary system, the concentration of efforts to regulate mainly the bank credit has unnecessarily narrowed the ambit of monetary policy: The technique of discretionary quantitative ceilings has further narrowed down this scope because these ceilings are applicable only to certain types of bank credit to the private sector; they exclude bank credit provided for public food procurement, fertilisers and exports credit, and the credit for all purposes by banks other than scheduled commercial banks. Under the alternative system, the policy would be more effective because changes in interest rates have a more general relevance and pervasive influence; and such changes when brought about through changes in the bank rate, open market operations, etc, would be accompanied by changes in other crucial intermediate variables such as money supply, size and composition of the government debt, etc.

Operationally, it is difficult to turn off and on the flows of bank credit (and money) instantaneously as a result of which there may be an undeterred growth of bank credit for sometime even after the tight money policy is announced. This is particularly so when the cash credit/overdraft system of bank credit characterises the monetary system predominantly. Under such circumstances, there is a need for more rapid and larger increases in interest rates for the effectiveness of monetary policy. If the interest rates are also held down artificially in these circumstances, the monetary policy is bound to be ineffective as it has happened in India.

Another operational reason for freeing interest rates is that, as opposed to the quantity of bank credit (and money supply), the information about them is instantaneously available, and it is far more accurate. They, therefore, serve as excellent indicators of goings-on in the monetary system. The effective conduct of monetary policy requires that the authorities receive information on various indicators on week to week basis but at present, banking data are available to the authorities in the final accurate form after quite a significant time-lag. It is well known that these data are substantially revised even after two years or more after their first publication. With the reaching out of bank branches and the working of other financial institutions in the remote areas and given the slow communication and information processing arrangements, it has become impossible to lay hands on the relevant information with the speed required. It is, therefore, necessary to use interest rates as targets/indicators of monetary policy and to free them if they are to perform this role accurately. The experienced central bankers even in the economy such as US have made a strong plea for making a judicious use of interest rates in the conduct of monetary policy because while they are easily and accurately available, there are a number of random forces and estimating errors present in most short-period adjusted data on money and credit; and there are few weeks, even months, in which the reported movements in monetary and credit aggregates are not primarily the result of statistical 'noise'.[33]

The question of monetary control through administered *versus* free interest rate system has engaged attention of the concerned people in UK since long. A careful study of the debate on this issue in that country of the mother of central banking brings out a consensus against the system of discretionary regulation of interest rates and credit ceilings. In 1950s, the Radcliffe Committee was of the opinion that in normal circumstances credit rationing should be avoided because it is subject to substantial slippages, and it would lead to the loss of efficiency in the capital market. Recently, a number of authors[34] have argued against such a system because it is a conspicuous but uncertain way of reducing aggregate effective demand; it reduces the scope of monetary control; it does not guarantee that the rationed out units are the ones which are the least productive; and it is always likely that rationed out units would find their way around loan ceilings. It should be emphasised here with full force that the Bank of England also has always been against such a system. In its testimony to the Radcliffe Committee, it had made clear its distaste for and disinclination against the use of such a system, and it has maintained this position since then. The following quotation from the then Governor of the Bank of England ought to persuade Indian monetary authorities to review their policy of administered interest rates:

> " . . . quantitative restrictions should be used only when severe restraint is necessary. We are far from happy that we have had to use them so severely and so long not only because of their inherent disadvantages but also because of the strain which their prolonged use places upon the very happy co-operative as distinct from legalistic relationship which exists between Central Bank and commercial banks. It is not an economical and efficient system in which one side is continually looking for loopholes in the control and the other side continually trying to plug them. For all that, the longer ceiling restrictions are in force, the greater the strain on the system."[35]

The foregoing discussion should also show that the argument in support of the present system that it improves the predictability of the response of banks and other components of financial markets in respect of volume and terms of finance supplied by them in the event of changes in Central Bank policy does not stand scrutiny. As far as only interest rates are concerned, although it is true that they surely change when monetary policy is changed (because such changes do not depend upon indirect response-mechanism but are directly effected through fiat), the effectiveness of monetary policy is not increased because the stipulated interest rates do not adequately reflect changes/differences in relevant economic and other determinants of interest rates; and, in addition, changes in interest rates are accompanied by discretionary directives about credit disbursements which also, as shown earlier, are often determined by extra-economic considerations. If interest rates are freed and an active use of more than one technique of monetary control is made, the effect of changes in monetary policy would be greater because it would spread to the entire economic system.

It may be argued that although this is theoretically true, are there reasons to believe that the suggested mechanism of monetary control would actually work in India in this manner? There are two parts of this mechanism, the effect of changes in monetary policy instruments on market interest rates and other intermediate variables; and the effect of the latter on real variables or economic activity. Would both of these effects actually occur in Indian conditions? How widespread would they be? Would they not remain confined to the small segment of the monetary system, say the organised sector?

These are undoubtedly weighty issues and the strength of the case for the system of free interest rates depends upon their appropriate resolution. However, a number of considerations and much evidence in this regard do point towards a great potential for the success of an alternative monetary policy at the present stage of development of the Indian monetary system. We have accumulated considerable experience in the use of bank rate technique, and we do not have evidence to show that market rates would not respond to its changes if they are as bold and frequent as necessary. The government securities market in India has become quite well-developed in terms of its size, diversity of maturity structure, etc, and the Central Bank possesses enough legal powers to operate in this market. The stock of Treasury bills also happens to be significantly large. The potential for the effective conduct of OMO also, therefore, does exist provided the objectives of debt management policy are changed which, as it will be shown shortly, is quite possible. The experience in the recent past few years of the use of Cash Reserve Ratio (CRR) technique has shown that it can be an effective tool of monetary policy. In short, unlike in the past when the RBI has tended to rely very heavily on any one technique of monetary control in a given period, if more than one technique is harnessed in a well co-ordinated manner, the RBI would be in a position to influence the behaviour of intermediate variables such as market rates of interest, money supply, bank reserves, central bank refinance, etc.

Similarly, our study of the behaviour of different variables related to the aggregate effective demand has demonstrated that there is potential for transmitting the effect of monetary policy changes to economic activity also. We have already stated earlier that if the investment has not been restricted so far by changes in interest rates, it has been so because of the low level of the latter. Consumption and saving have been found to be responsive to changes in interest rates. It is often feared that the expenditure of the public sector is not responsive to monetary management. That this fear is exaggerated is indicated by the discovered negative, although statistically insignificant, relationship between interest rates on the one hand, and government consumption expenditure and government borrowings on the other. Further, the demand by public sector enterprises to help them to reduce their debt/equity ratios, and the recent action by certain public sector trading corporations, *viz*, Cotton Corporation of India to reduce inventories because *inter alia* mounting interest costs have increased their operating losses certainly reflect the possibility of responsiveness of even public sector spending decisions to monetary variables.[36]

Let it be emphasised that since the Indian monetary system has become fairly well-matured and well-integrated,[37] the spread effects of the bold monetary policy changes are now going to be really wide and quick. This is true of both the 'organised' and 'unorganised' sectors. In fact, it is not really meaningful at this stage of the development of Indian economy to talk of the dichotomy of the 'organised' and 'unorganised' sectors of the money market; this traditional bugbear of Indian monetary policy is now only of a historical value. The constituents of the so-called 'unorganised' sector namely, agriculture, small scale and cottage industries, other rural activities, retail trade, etc, have now become quite well-linked with the 'organised' sector through the spread of commercial and co-operative banking, operations of special financial institutions such as SFCs, SIICs/SIDCs, etc, creation of industrial estates, growth of agricultural marketing organisations such as FCI, CCI, State Marketing Federations, Monopoly Cotton Procurement, etc.

In summary, the alternative system proposed here would make monetary management in India more effective and efficient because the decisions at all different stages of the transmission process have now become amenable to the influence of policy changes.

### EFFICIENCY AND EQUITY IN GOVERNMENT FINANCES

Two major motivations for administering interest rates have been to ensure cheap availability of funds to the government, and to the 'priority sectors' and 'economically weaker and small' borrowers. The ideological form of the latter has been to state that the present system helps in bringing about equality and social justice. We deal with these aspects in this and the following sections.

The provision of cheap finance to the government is a totally unjustifiable argument for the continuation of the present system. To ensure availability of cheap credit to the government or to any borrower for that matter cannot be made the central objective or function of the Central banking policy. Further, the objective of debt raising activity of the government has to be to increase employment and output with stable prices and not to obtain command over resources at cheap cost irrespective of the consequences of such a policy. Since it is by now well-established that government finances in general and debt management in particular have been the important sources of instability in the economy, and conflict with the working of monetary policy, it would be wise if the goal of holding down interest cost is not allowed to take a precedence over the other goals mentioned above. An additional reason for doing this is that the government with socialistic persuasion should not exploit its monopolistic or statutory position to appropriate, as it now does, large amount of funds at an unnaturally low cost.

Once interest rates on public debt are competitively raised, given its other investment characteristics such as safety, liquidity, etc, the government would be able to raise the major part of its financial requirements without compulsion. There would also be an increase in efficiency not only within the public sector but also in the economy as a whole because of chain effects of such a measure. The resultant increase in the debt-servicing burden should not frighten and, therefore, dissuade the government from doing this because since government debt is held mainly by government institutions, it would mean only an accounting change. Further, the government is in a position to meet this burden from borrowing ever more from the public without facing the risk of bankruptcy. But in the process, the higher rates would compel a more economical and efficient use of resources, and would also have a higher income effect.

### PRIORITY SECTORS' NEEDS

The provision of finance to priority sector borrowers is a sensitive and ticklish problem. There is no doubt that the interests of these essential but disadvantaged economic units ought to be served well by the financial system. But are higher interest rates really unsuitable for and against the interests of these borrowers? Has their disadvantage consisted in cost or availability of credit? Do they have capacity to pay higher interest rates? A dispassionate and non-ideological review of these issues would lead one to conclude that the case for higher interest rates is defensible even in this respect.

It appears to us that banks and financial institutions had been guilty of not making adequate credit available to these units rather than of charging higher interest rates to them. The objective of increasing the availability of funds to them, therefore, has been right. But, as pointed out earlier, there is really no need to adopt the measure of prescribing quantitative credit ceilings and targets to do this. The existing legal framework, moral suasion, and the minimum of directives can achieve this. This increased flow of credit, however, should be made at appropriate and not subsidised rates of interest. The higher interest rates themselves would augment the supply of funds to these borrowers *via* increase in the resources of the financial system and greater willingness of banks, etc, to lend to them. The experience in Indonesia of increasing interest rates during 1960s and 1970s has been that it led to an increase in the resources of banks which, in turn, led to their search for borrowers in the small-scale, trading, and other sectors.[38]

As to the capacity of these borrowers, the rates in the 'unorganised' sector admittedly do not reflect such capacity; they have been certainly exploitative, but is there really a need to go to the other extreme and supply funds at excessively subsidised rates? We deem such a policy to be unnecessary and unwise. It is to be noted that the capacity to pay higher rates is to be decided with reference to the rate of return not on current methods of production and cultivation but on the improved ones. Just as the high rates in the 'unorganised' sector have resulted in low investment because no worthwhile project can be implemented at such a high cost of credit,[39] the deleterious effects of low rates in the form of unproductive use of funds, encouragement of inappropriate and conspicuous technology, etc, also should not be overlooked. The best policy would be to charge interest rates between the exorbitant rates in the 'unorganised' sector and currently prevailing highly subsidised rates on institutional credit.

There are also very crucial practical considerations for abandoning the present system. Firstly, the cheap credit is being appropriated on a large scale by the untargeted groups of borrowers because of the existence of various loopholes in the system, corruption, imprecise nature of definition of small-scale units, bogus registration of small units, creation of captive small units by large units, ingenuity and influence of big units and rich farmers to obtain benefits not meant for them, etc. Secondly, in spite of the low official rates, the effective or implicit cost of credit to these borrowers in many cases actually works out to be very high indeed because they have to make underhand payments to obtain loans and the prices of goods to be purchased with sanctioned credit are 'marked up' to benefit certain functionaries and vested interests.

### INCOME DISTRIBUTION AND SOCIAL JUSTICE

This is a far more complex and wider issue but we cannot completely slur over it because the administered system of interest rates has been prominently projected as one of the means of delivering social justice. While, the discussion in the previous section (6) partly serves to indicate the weakness of this argument, the other major points are briefly discussed below.

The interest rates policy is hardly the right policy for tackling the problem of income distribution. The government budgetary policy would prove more potent in this context. Even in its supplementary role, it is the higher rather than lower interest rates which would serve the objective of income distribution better. The higher interest rates on bank deposits, small savings, provident funds, etc, would directly benefit the lower and middle income groups. In the ultimate analysis, these groups are 'surplus-spending units' to a greater extent than 'deficit-spending units' as a result of which their position is bettered more by the higher interest rates on financial savings than by the lower lending rates.

To the extent that the higher interest rates would encourage the adoption of labour intensive techniques, and since the elasticity of substitution of labour for capital is most likely to be high in developing countries, the higher interest rates policy would serve the cause of social justice better *via* the greater employment generation and consequent increase in the share of wages in national income. Moreover, to the extent that such a policy would be instrumental in curbing inflation, the lower and fixed income groups would be benefited.

The Indian economy is characterised by a plethora of price and distribution controls, the systems of industrial and import licensing, etc. These institutional arrangements have been very much loaded in favour of the well-to-do, well-connected, and the elite. Now, the possession of a licence, a quota, a permit, opens the doors of banks and financial institutions. Therefore, it is the already rich and economically powerful people who benefit from the lower interest rates. Under the present set-up, they reap double benefits—they appropriate high yielding investment opportunities, many of which are of speculative character, and they are also in a position to appropriate directly or indirectly cheap credit to finance those opportunities. In the inflationary situation, their gains have multiplied because they have benefited both as debtors and investors. In contradistinction, the poor, the low, and the middle income people have been impoverished both because of the decline in their purchasing power and low and fixed interest rates on the media of savings which are within their reach and which they prefer to hold. Thus, the case for the higher interest rates is strong from the point of view of social justice also.

## IV

## The Experiences of Other Countries

The adoption of the policy of low and controlled interest rates appears to be quite common in other countries also. Such a policy has existed in US, UK, Japan, Australia, New Zealand, South Africa, Malaysia, Indonesia, South Korea, Taiwan, and Latin American countries in one period or other and in one part of the financial system or other. It has taken its extreme form in the communist nations. In the non-communist world, however, the controls in India have been probably much more pervasive and direct than in other countries. The knowledge of experiences in these countries, despite the limitations to which inter-country comparisons are subject, would definitely prove instructive in formulating appropriate policy in this regard. We have, therefore, already referred to some of these experiences at the relevant junctures. Some of the other major lessons which emerge from the study of these experiences are briefly discussed below.

There does not appear to be any fixed—either positive or negative—correlation between the system of interest rates and the performance of the economy with regard to saving, investment, price stability, and growth. While South Korea and Taiwan have achieved quite good results with the flexible and high interest policy, Malaysia and Singapore performed well with the low interest rate strategy.[40] Similarly, Japan has performed exceptionally well although it has been pursuing the low interest rates policy.[41] In the Commonwealth, New Zealand, Australia and UK with controls have probably done as well as the free system of Canada.[42]

But there has been unmistakably a high degree of dissatisfaction with the working of the administered rates system wherever it has been practised. Except in Japan, the good performance in such systems mentioned above has not been good enough when compared to the potential which existed in those economies. Therefore, they have either abandoned or considerably modified the administered interest rates system. The changes in the philosophy and policy in this regard which have occurred in the socialistic countries have already been referred to. Among the non-communist world, the US abandoned the policy of supporting the government borrowing operations at fixed interest rates in 1951 through the Treasury-Federal Reserve Accord in that year; and there has been a widespread criticism of the Regulation Q in that country. Similarly, the policy of interest rates cartel, and ceilings on bank credit in UK has been under severe criticism (the dissatisfaction with it of the Bank of England itself has been shown earlier), and it was finally discontinued in 1971 under what has come to be known as the 'new approach' to monetary management propounded by the Bank of England in its document 'Competition and Credit Control'.

Japan could achieve excellent results in spite of low interest rates because of higher saving ratio and higher productivity which, in turn, were mainly due to socio-economic forces, absence of deficit financing, etc.[43] What is, however, to be noted is that the Bank of Japan has been in favour of abandoning the administered rates system although it has not been able to do so because of government opposition to it on the basis of considerations which can easily be expected to have had a 'political' content. It has been pointed out by Patrick that the Bank of Japan preferred to have a more flexible market-determined interest rates structure, which would have resulted in raising of interest rates to a higher level than in the past. But the government insisted upon a policy of relatively low rates in order to maintain cost of exports low and to develop the long-term capital market. In spite of overall good results, such a policy has been regarded as highly misguided one because it has actually led to worsening of the balance of payments and the need for progressively tighter monetary policy during the post-war years.[44]

Among the Commonwealth countries, in New Zealand, the system is shown to have inexorably led to an increasingly complex and pervasive constraints on the financial system, and to a stifling of competition as a result of which the country suffered from the ineffective and heavily lagged responsiveness to real needs, and from the failure to curb effective demand. The situation in Australia was more or less similar till 1963-64 when the system was liberalised in the sense that interest rates were raised to a much more appropriate level and a greater use of OMO was resorted to. On the basis of a comparative study of the economies of New Zealand, Australia, South Africa and Canada, it has been recommended that New Zealand and Australia should emulate the example of Canada and eliminate the use of direct controls on interest rates.[45]

The Latin American countries also have found that ceilings on interest rates, etc, became more and more repressive in an inflationary period; inflation required upward movement of the ceiling rate but the administratively determined increases in rates proved to be ad hoc and inadequate. The indexation of interest rates did not help for a variety of reasons. Therefore, many countries opted for the strategy of free interest rates at one point of time or the other. For example, while Uruguay and Nicaragua freed the rates in 1976, Argentina, Brazil, and Chile did so during 1967-76.[46]

## V

## Summary and Conclusions

We have discussed in this study the evolution of the system of low and administratively fixed interest rates and the discretionary ceilings of credit allocation, the alleged justification for the adoption of such a system, and its effects on the behaviour of interest rates, the working of monetary control, and the economic activity in India. We have shown that this system has been harmful and, therefore, it should be replaced by the alternative system of high and free interest rates with the dependence on more than one technique of monetary control used in a well co-ordinated manner. Such an alternative system would be very much conducive to increasing the rate of saving, efficiency of investment, efficiency of the financial system, efficiency of monetary control, and, as a result, efficiency of overall economic activity. The alleged justification that the vast needs of government finance, and the fulfilment of planning objectives such as meeting the financial requirements of the priority sectors and promoting equitable distribution of income require the present system of administered interest rates has been shown to be altogether unconvincing. The experiences of countries in the socialistic block, Commonwealth, Latin America, and Asia also support the case for the alternative system. There are no reasons why its adoption cannot be feasible in India.

### Notes

[This study has been prepared for the Committee to Review the Working of the Monetary System. The author is thankful to the Committee for giving him an opportunity for working on this topic. The views expressed herein are those of the author.]

4 Quoted by Myrdal, G, op cit, p 909.

5 The description by the RBI of its own policy in this respect is confusing. Sometimes it states that it stipulated the maximum rate, at other times it states that it stipulated the minimum rate on a deposit of a given maturity. See Reserve Bank of India, "Functions and Working", Bombay, 1983, pp 87-91.

6 For further discussion of this point and general features of the behaviour of interest rates in India, see, Bhole L M, "Financial Markets and Institutions", Tata McGraw-

APPOINTMENTS

**RESEARCH AND INFORMATION SYSTEM FOR THE NON-ALIGNED AND OTHER DEVELOPING COUNTRIES**

Invites applications from eligible candidates for the following posts:

1. **SENIOR FELLOW:** A High Second Class M.A. in Economics/Statistics/Operations Research. Ph.D. Degree with research experience for at least 15 years in the field of International Economic Relations and publications of high quality. Senior Fellow may be put in any of the following scales: Rs 1500-1800/1800-2000/2000-2250.
2. **FELLOW:** A High Second Class M.A. in Economics/Statistics/Operations Research. Ph.D. Degree and Post-Doctoral research work/experience for at least five years in the field of applied economics. Pay Scale: Rs 1100-1600.
3. **RESEARCH ASSOCIATE:** No. of Posts—Two: A High Second Class M.A. in Economics/Statistics/Operations Research with knowledge of quantitative methods of analysis. Research experience for two years or M.Phil. degree. Working experience of Computer/Micro-processor desirable. Pay Scale: Rs 700-1300.

Except the posts of Senior Fellow and one Research Associate, all other posts are to be on ad hoc-basis for two years only for project work.

All the above pay scales carry usual allowances permissible. Reservations to SC/STs applicable as per Government Rules. Selection Committee has the power to relax the eligibility criteria in suitable cases. Candidates for the above posts may also be considered for appointments for fixed period on contractual/deputation basis.

Application giving full bio-data should reach within 15 days from the date of advertisement, to Administrative Officer, Research and Information System, 40-B, Lodhi Estate, New Delhi-110 003.

10 The period of 1933-50 happens to be the phase of lowest interest rates in India which could be due to the general depression and exigencies of war finance. In the case of the banks' advances rate, there is a statistical explanation also. During 1935-50, this rate has been represented by the bank rate which is not strictly comparable with the bank rate of the Imperial Bank before 1935, and SBI advances rate after 1950.

17 Galbis, V, 'Money, Investment and Growth in Latin America, 1961-73', *Economic Development and Cultural Change*, April 1979.

18 Some of the equations estimated by Fry are too simplistic to be taken seriously; some of the relationships estimated by him and Galbis are not really relevant in settling the controversy of high *versus* low interest rates, *viz*, hypotheses of complementarity between demand for money and investment, and the effect of inflation on economic growth; and notwithstanding elaborate specifications, the estimated equations by Galbis do not contain the interest rate variable which drastically reduces the utility of his study in this context.

19 This notation is followed in all regression results in this study.

20 Rao, V K R V, "India's National Income, 1950-80", Sage Publications, New Delhi, 1983, p 136.

21 We do not know what part of current account deposits arise out of created credit but, given the fact that these deposits are mainly held by the business and industrial account-holders, it may not be wrong to assume that they arise largely out of created credit.

22 For further discussion in this regard, see Bhole, L M, 'Retained Earnings, Dividends, and Share Prices of Indian Joint-Stock Companies', *Economic and Political Weekly*, Review of Management, August 1980.

23 It is sometimes argued that where banks are a predominant financial intermediary, interest rates ceilings are justifiable because the competitive bidding of interest rates would raise the cost for all banks without significantly improving their resource-position *vis-a-vis* each other. This is a very weak argument because it neglects the potential for the growth of other intermediaries and also the interests of savers.

## Roche Products

ROCHE PRODUCTS is going ahead with modernisation of both its plants at a cost of about Rs three crore. Meanwhile, the company's production of vitamin A has been affected due to shortage of raw materials. The overall sales in the current year have been about 10 per cent higher compared to the corresponding period last year, according to R Setlur, Chairman. The company has obtained a price increase in vitamin A, but its applications for increases in prices of formulations are still pending with the government. Setlur told shareholders at the first annual general meeting after dilution of foreign equity that price fixation continued to be the most difficult problem facing the company and the industry. The subject had been considered at length by the Working Group and Steering Committee of the Pharmaceutical Development Council and the government was presently seized of the problem. There seemed to be a general concensus that the price control should be at a minimum level. He hoped in the new regulations steps would be taken to ensure automatic revision of prices necessitated by increases in input costs.

IPCL INTRODUCES AGRIFILM FOR CANAL LINING

Eliminate water loss through seepage, reduce costs, increase agricultural productivity

AGRIFILM is tough, wide-width, black, low density polyethylene (LDPE) film marketed by IPCL. AGRIFILM is tailor-made for canal lining applications and available in widths of up to 12 metres, and thicknesses of 100 to 250 microns, conforming to ISI standards. AGRIFILM is backed by IPCL's expertise and available to all irrigation departments at a fixed and uniform price throughout the country.

AGRIFILM

# Change is permanent

**Change is the essence of growth, an edict of management.**

**And, in today's world, the choice before an organisation is not between 'change' and 'no change', but between managing the change and being managed by events.**

**Change, when consciously imposed from within, opens up new opportunities, new avenues of growth. Paradoxically, the process of change is, and has to be, permanent.**

**This is the philosophy behind the changing role of MMTC — from a mere canalising agency to an international trading house.**

Change, to MMTC, has meant putting its expertise in bulk buying and selling to larger purposes of national growth.

Like opening up global markets for India's small scale entrepreneurs. Adopting new strategies like Third country trading, Three-way trade, Joint ventures both in India and abroad, Equity participation abroad in sources of raw materials as well as in basic inputs.

Entering the arena of non-canalised items — ranging from importing PVC resins and mercury to exporting diamonds and graphite electrodes.

Improving customer service by decentralising operations, streamlining the distribution system and setting up Customer Service cells.

Reorienting the organisation to meet new challenges — through long-range planning, computerisation, systems reappraisal and organisation restructuring.

And this change already reflects in MMTC's performance. Non-canalised exports registered a fourfold increase in the first half of 1984-85, while the year's turnover is poised for a threefold rise. A record quantity of fertilisers was imported, at the right time, resulting in an all-time high foodgrain production and substantial savings in foreign exchange. Long-term contracts worth millions of dollars have been concluded for iron ore exports. For the first time, a counter-trade deal has been finalised with Zimbabwe for importing Asbestos against the export of engineering goods — an important step towards diversification and growth.

All this has led to increased employment opportunities which now exceed half a million and generated a new industrial and economic prosperity.

Yes, change is permanent. A philosophy chiselled in the minds of everyone at MMTC, the cornerstone of its success.

# Burroughs announces our second hundred year plan.

A hundred years ago, with the introduction of the first adding machine, a company was founded with one single objective: to make business more cost-efficient.

A century later, celebrating our centennial year, Burroughs Corporation has become a worldwide leader in information processing systems geared to helping businesses improve the bottom line.

Today, in an age when productivity is threatened by information overload, the need for cost-efficient information management is greater than ever.

Which is why Burroughs is rededicating our efforts to making our products, services and support systems more cost-efficient and productive than ever before. This commitment to the future is symbolized by our new corporate logo.

We've focused our resources on specific lines of business emphasizing finance, manufacturing and distribution, health care, government and education among others. And we've developed complete systems to meet their special information processing problems.

In the area of new products, we've designed a family of mainframes that costs less to run, needs fewer support people, and allows users to increase processing power up to 70 times without reprogramming.

Plus, we've developed software that brings the programming and operational ease of personal computing to mainframes. And equally remarkable software that increases programmer productivity up to an astonishing 1000%.

Of course, Burroughs has the office and data processing products and supplies to go with our systems.

And we offer a lot more.

Like our System Development Corporation —an acknowledged leader in secure networks and systems integration. And our Memorex unit—offering highly advanced storage devices for Burroughs and other systems complemented by a wide range of peripherals.

Finally, to help our people put our plan into practice, we've recently spent $ 67 million on personnel training and more than $ 100 million on service and support facilities.

In an industry where many companies don't last a decade, Burroughs is proud to be launching our second century.

The experience and insights we've gained are helping us develop new solutions that will benefit our customers and their profitability for the next hundred years

# Sabotaging Relief for Bhopal Victims

FIRST the medical establishment with its ostrich-like attitude, inane arguments and general insensitivity and now the Madhya Pradesh government using its muscle arm, the police, appear determined to stall and sabotage all efforts to provide medical relief and detoxification measures to the gas victims in Bhopal. The latest move towards achieving this objective has been the arrest and illtreatment of several activists and doctors in Bhopal and the closure of the Jan Swasthya Kendra (People's Health Clinic) which had been set up jointly by three voluntary groups, the Zaherili Gaskand Sangarsh Morcha, the Citizens' Relief and Rehabilitation Committee, and the Trade Union Relief Fund. On the night of June 24 all the doctors and several Morcha activists were picked up under preventive detention laws, harassed, manhandled, threatened, abused and locked up in a dirty cell. While some of the doctors were released the following day others were detained on a variety of charges for a longer period. Some of the Morcha activists were rearrested during the massive demonstration by the gas victims in front of the state legislature on June 25, demanding relief. The same day the Jan Swasthya Kendra was seized and activists were barred from entering the premises. The clinic now appears to have been handed over to the Union Carbide authorities, though the doctors have been released.

The clinic was inaugurated on June 3 on unused Union Carbide land forcibly occupied by a group of agitators and gas victims with the support of eminent citizens such as J Swaminathan and B V Karanth. A make-shift tin structure was constructed and the main focus of the clinic's activities has been the administration of sodium thiosulphate as per the recommendations of the Indian Council of Medical Research (ICMR). The clinic has also kept accurate and reliable records which have conclusively shown the drastic improvement achieved because of sodium thiosulphate detoxification. The clinic was run by a relay of doctors deputed from voluntary and activists groups from different parts of the country. For instance, one Bombay doctor had volunteered his services for two months and the Drug Action Forum, Calcutta, and the West Bengal Junior Doctors' Association had been sending groups of doctors in relays and doctors from BHU and medical colleges in New Delhi had also been helping out at considerable cost to themselves in terms of career and service problems.

According to one report, over 600 gas victims had received NaTS (sodium thiosulphate) injections in the first ten days. Most of those who had received the complete course of six NaTS injections had reported relief from persistent bodyache, sleeplessness, lack of appetite and also breathlessness. The only other centre administering NaTS is the government-run 30-bed hospital and medical centre at the DIG Bungalow near the Union Carbide factory. But the number of patients who are being administered the injection remains at a pilot project level which is marginal. Hence the closure of the People's Health Clinic will now mean that hundreds of those who had only received a part of the full course of injections will have to run from pillar to post to obtain the rest.

According to medical surveys conducted in Bhopal there are thousands of gas victims who need to receive NaTS. In these circumstances the state government's action of intimidating and arresting doctors and closing down the clinic deserves to be severely criticised. Even worse, the police have seized medical records which are not only of value in proving conclusively the efficacy of NaTS but are very important to the further treatment of the patients.

These measures have already aroused the anger of many civil liberties groups and health and science groups. The Medico Friends Circle has sent telegrams of protest to the prime minister and the MP chief minister and to the ICMR. Other groups have issued statements strongly condemning the action and demanding the return of the clinic to the groups concerned with all records intact.

The clinic needs to be urgently reopened. This would also mean that the state government and the police should stop harassment and intimidation of doctors many of whom are from outside Bhopal. One hopes that these actions which directly interfere with the process of delivering medical services as per the recommendations of a national council of research, will motivate the doctors' organisations to register protest. It would be a great pity if these measures by the government are allowed to succeed in intimidating and preventing doctors from coming to Bhopal where their services are badly needed.

## *Punjab*

### Faint Thaw

THE government claims to have made a number of 'concessions' to the Sikhs recently. Among these is the decision to release Sikh detenus against whom there are no serious charges and to review the detention of those below 20 years of age. It is questionable to what extent these steps—like the earlier belated decision to order a judicial enquiry into the massacre of Sikhs after Indira Gandhi's assassination—can be regarded as concessions at all. On the contrary, it would be quite legitimate to see them as bearing out the charge of the government's critics that there had been large-scale indiscriminate arrest, ill-treatment and detention of Sikh young men, including teenagers, in the army's and the Punjab administration's anti-terrorist operations. The Punjab Governor himself acknowledged in early June that acts of terrorism in Punjab were linked to the Sikh youth's sense of "alienation, anxiety and hurt" and advised local officials to avoid harassment of "innocent Sikhs".

What is, however, significant in recent developments in Punjab is that the Akali Dal leaders have desisted from dismissing out of hand the 'concessions' offered by the government. One can detect in this signs of an important change in the approach of the Akali Dal leadership under Harchand Singh Longowal. Longowal appears to have decided to give up being on the defensive in the face of the challenge from the ostensibly more 'radical' group led by the late Bhindranwale's father, Joginder Singh. Instead he seems to be proceeding increasingly on the premise that, despite the bitterness and even hostility among Sikhs in Punjab over the government's actions since Operation Bluestar, support for terrorism and terrorists is still very limited and that there would be popular support for efforts towards a political settlement through talks with the government. For the Akali Dal's political fortunes as well, the Longowal leadership seems to have concluded, if it was not to face recurrent challenges from so-called radical elements, such as the Joginder Singh group, it was best to work as speedily as possible towards a political settlement. Till recently the Longowal group appeared to fall between the two stools of being basically committed to a negotiated political solution and at the same time feeling compelled to engage in a competition for radicalism to ward off challenges from elements within the Akali Dal and outside which struck seemingly radical and uncompromising postures. This had led Longowal, immediately after his release from detention, to make the near-fatal error of joining in the lionising of the late Bhindranwale.

It is possible, at the same time, to discern some change in the government's attitude. This change is to be seen not so much in the so-called 'concessions' announced recently but in some signs of rethinking on the tactics, followed unremittingly hitherto, of seeking to erode popular support for the Akali Dal by encouraging challenges to the Akali leadership from more radical quarters. Initially the government appeared to be pursuing the same tactics in its attitude to the most recent emergence of the Joginder Singh group, but there seems to be a change of late. It may not be entirely wishful to suggest that the Congress leadership is beginning to realise that the building up of extremist elements among the Sikhs (such as Bhindranwale or Joginder Singh) in pursuit of the policy of weakening the Akali Dal, quite apart from its disastrous larger consequences for Punjab and the country as a whole, has not served the interests of the Congress(I) in terms of winning over to its side the Sikhs who may be disenchanted with the Akali Dal.

While signs are thus more propitious for some movement towards a political solution than they have ever been as long as the government was bent upon pulling down the Akali Dal by playing the extremist card against it, both the Akali Dal and the government carry a heavy burden of the events of the recent past. Given what the Sikhs have had to endure in Punjab and outside in the last one year, the Akali Dal, despite its leadership's apparent resolve to take the extremist bull by the horns, cannot afford to be seen to go too far in its eagerness to enter into negotiations with the government without some evidence of intent on the government's part to consider its demands seriously. On the side of the government, considering what a crucial role the Congress(I)'s anti-Akali and anti-Sikh propaganda played in winning Hindu votes for the party throughout northern India in the last Lok Sabha and Assembly elections, the party leadership is bound to calculate carefully the likely political costs of entering into negotiations with the Akali Dal—which in the Congress(I) leadership's election propaganda just a few months ago had been portrayed as representing the worst type of communal and extremist threat to the country's integrity and security.

## *World Economy*

### Another Recession?

A FLASH estimate by the US Commerce Department suggests that the US economy grew at a real annual rate of 3.1 per cent in the second quarter of 1985. The Commerce Department has at the same time announced a revision of the first quarter figure from 0.7 per cent annual rate to 0.3 per cent.

The news that the US economy has picked up growth has been greeted with much relief by the US Administration as well as by other countries. After achieving an exceptional growth of 6.8 per cent in 1984, it was feared that the US economy might be heading for a recession, as its burgeoning trade deficit siphons off the stimulus to the rest of the world. There are widespread fears that as the US economy slows down, the US Administration will find it increasingly difficult to resist protectionist pressures.

On the announcement of the flash estimate for second quarter, the US Commerce Secretary said that "the worst of the slowdown is probably behind us ... We should be back on a higher growth path by summer's end." It is not clear, however, that one can say confidently that growth in the US economy has picked up. The 'flash' estimate is based on very partial data, and is subject to significant revisions; many analysts believe that it will be revised downwards. The second quarter figure seems to have been boosted by the surge in consumer spending, as a result of late repayment of tax refunds.

Even if the second quarter growth rate were to be near the 'flash' estimate, the US economy would have to grow at an annual rate of over 6 per cent during the second half for growth in 1985 as a whole to reach the US Administration's forecast of 4 per cent. The recent decline in the value of the dollar and the fall in interest rates have created a more favourable climate for US growth. However, the basic situation remains fragile, as both the value of the dollar and interest rates show tendencies of firming up as soon as US growth revives. It is also not clear that the US can recoup its lost competitiveness in manufactured goods quickly enough, even if the dollar were to depreciate. US manufacturing output has remained stagnant since about mid-1984 and corporate profits have been under a squeeze. Many observers believe that US growth will fall below an annual rate of 3 per cent in the second half of 1985.

The pace of US economic growth has become quite critical to the rest of the industrial countries—and, for that matter, to the rest of the world—as it is the US economy which provided much of the stimulus for the recovery in the past couple of years from the deepest and longest recession in the post-war period. It is estimated that the US has accounted for just over 70 per cent of the increase in aggregate demand in the whole OECD area in 1983 and 1984, against its weight in output of some 40 per cent. Japan and Canada have relied on the US boom for increased exports; and many developing country debtors have managed to stay viable only because of increased exports to the US market. A marked slowdown in US growth—and contraction in its trade deficit—could mean another major recession in the world, unless the other industrial countries undertake a compensatory expansion. But there is little evidence that they will.

## *Politics*

### The Other Terrorism

THE Indian people are justifiably having a feeling of utter revulsion, which is shared by other nations, over the mindless, brutal terrorism which appears, from various indications available so far, to be responsible for the plunging of the Air India liner with 329 persons on board in the Atlantic Ocean. Earlier, the setting up of booby traps in the form of the so-called transistor bombs in and around Delhi had also caused a similar wave of horror in this country and had prompted the Government of India to enact an extremely stringent and harsh law for the suppression of terrorism. Yet a different kind of endemic terrorism seems to be provoking very little reaction—either from the powers that be or from the enlightened public opinion.

About a month ago, *Telegraph*, Calcutta, had on May 26 carried a full page investigative report with photographic illustrations about this different kind of "sheer terror of the state". It wrote:

> In village after village, near as well as remote from urban centres, in the western, central and eastern UP, the revelation is the same: the people of India live in stark, palpable terror of the state that is supposed to serve them. They are so utterly scared of the policemen and the administrator that when they see a jeep or a car approaching they hide in the field.

The report then goes on to narrate a number of specific cases in a number of UP districts in which people, certified by common consent in most instances as "harmless and decent" men, were openly grabbed by the police right in the presence of other villagers, then removed to another place a few kilometres away and shot out of hand. The police then officially recorded these murders as "encounters with dacoits and criminals". The report cites in this connection the following cases of murders by the police in recent months:

(i) of Brijmohan Passi, Chandrika and Chirchiri who were seized by the police from Sadupur Mahariya in the Sitapur district on April 16;
(ii) of Lore from the Bharatpur village of the same district on March 13;
(iii) of Chhabinath Singh of Jangaon, seized from the Puja Hotel in Hardoi town on February 12;
(iv) of Ram Dass of the village Makhdoom in Mathura district on March 25;
(v) of Balbeer, Gyan Singh and Gandhi Babu of the village Budhera in Agra district on March 28.

The report then concludes:

> Everywhere we go, the police version is the same—the police party was passing through such and such village, happened to encounter a gang of dacoits and in the cross-fire so-and-so was killed. But everywhere there are enough witnesses to prove that the police picked up 'so-and-so' at one place, and murdered him in premeditated fashion at another.

The reporter's probe revealed that in most cases, either the unsatisfied demand by the policemen for illegal gratification or instigation by the powerful patrons of the policemen among the ruling party was responsible for the elimination of the helpless victims.

These lawless murders take place, not in the hills and jungles of some peripheral areas, but in the heart of the heartland of the 'world's largest democracy'. In the month that has passed since the publication of the full-page report, it does not seem to have made the slightest impression on the government.

The recently enacted anti-terrorist law is applicable to attempts "to strike terror in the people or to alienate any section of the people". The law also provides that "persons in the service of the government" will come under the purview of the Act. The involvement of the government servants, ie, policemen, in these crimes has been noted above. About alienating the people, the *Telegraph* report says:

> The villagers expect nothing better from the government. 'What have we got to do with the *sarkar*, only *dalals* (informers) and criminals keep in touch with it', we are told at one village. At another, we learn about the true extent of alienation.

Yet the government is unmoved! Should we still expect that the heavy anti-terrorist guns of the government are designed to shoot one way only?

## *West Asia*

### Limits of US Power

THE 39 US hostages held by the Lebanese Shii hijackers of the TWA flight were released on June 30. The seventeen days for which the hostages were detained exposed the limitations of US power. The US is now trying to retrieve lost ground by trying to bring about a boycott of Beirut airport by international airlines and by threatening to withdraw landing rights in the US of airlines which defy the US boycott of Beirut. The US Administration has also declared that none of the hijackers would go 'scot-free'.

For seventeen days, however, the US was shown to be powerless and was left with no option but to respond as the hijackers wanted. The show of military power and ordering of the ships of the Sixth Fleet to close in on Lebanon proved ineffective since the hijackers knew that the US was in no position to launch a military raid on Beirut. In the event of such a move, the Amal leadership which acted as mediator threatened to pull out and withdraw the assurance of the safety of the hostages. Eventually, President Reagan had to concede that the US policy of "swift and effective retribution" had been stymied. Even in the US, public opinion was directed not so much against the hijackers as at the unhelpful attitude of Israel.

The hijacking was linked to the 766 Lebanese prisoners taken to Israel in April by the Israeli forces withdrawing from Lebanon. Drawing a parallel between the two actions, the Lebanese Amal leader, Nabih Berri, said "when a few dozen [hostages] are held, the world is turned upside down. When hundreds of our sons are arrested it is nothing." The hijacking also put US-Israeli relations under strain, though for a short while. Israel struck a posture of regarding the hijacking as purely an American affair and of insisting on a public request by the US before it would release the Lebanese prisoners held by it. Finally, the US had to request the Red Cross and Syria to intervene on its behalf. Announcing the release of the US hostages, the Amal leadership claimed that it had "guarantees from Syria and President Hafez Assad" for the release of the Lebanese prisoners.

The hostage crisis in Beirut has raised questions about the universality of international laws. The hijacking in itself was illegal, but what means do small countries like Lebanon have to counter the illegal acts of a military power such as Israel? Had not the US hostages been taken would it have been possible to compel Israel to release the Lebanese prisoners? And what about the United States' own publicly acknowledged

efforts to overthrow the lawful government of Nicaragua by arming and financing terrorists and saboteurs?

The US demand for an international boycott of Beirut airport is partly also a response to the fact that even traditionally pro-US groups in Lebanon such as the Falangists have recently drawn closer to Syria which has indeed emerged as the dominant outside power in Lebanon, despite the military superiority of Israel. The US action puts pressure on different Lebanese groups and creates strains among them. There has been fighting between Druzes and Shiis in Beirut over control of Beirut airport and many Lebanese groups, while criticising the US boycott, have called for improving security around the airport to minimise the possibility of hijacking.

## *Philippines*

### Marcos's Growing Desperation

**BY declaring to a Paris-based TV team his intention to call in foreign, obviously US, troops to contain any threatened sweep of the communist-led armed struggles, President Ferdinand Marcos of the Philippines hardly blurted out a closely-guarded secret. This statement only serves to reveal his sense of desperation over the growth of the militant challenge to his oppressive regime.**

**Marcos's concern is not difficult to understand. The communist-led guerilla force, the National People's Army (NPA) is fast forging ahead. Its strength of armed fighters is reported to have gone up by 50 per cent from 20,000 in end-December 1983 to 30,000 in the beginning of 1985, spread out in 59 out of the 79 provinces of the Philippines.**

**Caught in the turmoil arising from the increasing polarisation of the nation between Marcos and his military backers on the one hand and the steadily growing strength of the militant armed opposition on the other, various intermediate Filipino forces are today engaged in manoeuvring for vantage positions in the country's power struggle. The political spectrum in-between the two extreme points represented by Marcos and the NPA is constituted by three broad alliances: At the Right end and the National Alliance Council (NAC) is a rallying point of conservative politicians who would retain their links with the USA while seeking the ouster of Marcos; next comes the Convener Group (CG) formed in November 1984 by Corazon Aquino, the widow of the murdered Opposition leader, Benigno Aquino, and some other liberal and business leaders. The CG is committed to electoral battles against Marcos only, though its platform includes the demand for the dismantling of the US bases on Filipino soil and demolition of the repressive state structure. Farthest to the Left within the intermediate spectrum stands the newly formed New National Alliance (NNA) headed by, among others, the former Senator Jose Diokno, a veteran fighter for democracy and national independence. The NNA calls for strengthening the "unity of the people, more than just politicians".**

**With the increasing signs of nervousness among the Filipino ruling circles and their US backers in the wake of the steady advance of the armed guerillas, the intermediate forces are now getting drawn into a feverish race for sucuring vantage points *vis-a-vis* the others. Marcos's open threat of inviting the foreign troops may add sharpness to this competitive struggle.**

## BUSINESS

# Oilseeds and Oils Economy Adrift

THE emerging scenario covering various facets of the oilseeds economy provides an interesting study and it raises issues which are well worth pondering over. Oilseeds and oil prices are appreciably lower than a year ago. While the government deemed it necessary to adopt measures to impart stability to the market, it never bothered to prune edible oil imports which are being maintained at a record high level.

The solvent extraction industry has been operating at less than half of its installed capacity and the incidence of sickness has been on the increase. Even so, new units have been coming up rather rapidly, more particularly in the co-operative sector or under the auspices of government agencies.

Exports of de-oiled meal have been on the decline—only soybean meal has been faring well—but no serious effort has been made to step up domestic demand which could offset the decline in exports with the result that the production of de-oiled meal and consequently the availability of solvent extracted oils have been adversely affected.

The vanaspati industry is fed with massive quantities of solvent extracted oils from abroad—imported oils are all solvent extracted—but the use of indigenous solvent extracted oils is banned. Only very recently, the industry has been permitted to use solvent extracted mustard oil the supply of which is very limited as there is little demand for mustard/rapeseed extractions.

Totally unconcerned about the foreign exchange implications of continued dependence on imported oils, the vanaspati industry keeps pleading for assured supply of imported oils and that too on the basis of output in the penultimate month. The industry is known for its ingenuity in manipulating production figures to avail of larger quantities of cheap imported oils.

Control over vanaspati prices and curbs on the usage of indigenous oils, apart from being irrational, accord ill with the government's avowed policy of liberalisation of the economy. But neither is the industry in favour of decontrol nor is the government in a mood to do away with controls. The absurdity of pursuing a policy which seeks to fix the price of vanaspati—refined and hydrogenated oil—at below that of liquid oil prices is all too obvious.

Resumption of futures trading in casterseed after a lapse of some eight years is being interpreted as a belated recognition on the part of the government of the role that futures markets can play in facilitating orderly marketing, ensuring efficient pricing, affording insurance cover against price hazards and assisting export promotion. If futures trading could really do all that one would like several commodities to be covered by hedge trading facilities. There is, however, no convincing evidence that the ban on futures trading has affected price stability or harmed the cause of exports.

No aspect of the oilseeds economy interests the common man more than the behaviour of oil prices, especially of edible oils. Unfortunately, discussions on this issue have generally betrayed confused thinking and a total lack of concern for the consumer, reflecting largely the dominating influence of the oil industry and the farm lobby.

Oilseeds and oil prices have registered sizeable declines over the past 12 months. Going by spot quotations in Bombay at the end of June and a year ago, castor oil is down by 37.3 per cent, rice bran oil by 33 per cent, mahuva oil by 24.5 per cent, cottonseed oil by 21.4 per cent, linseed oil by 20 per cent, kardi oil by 18.8 per cent, groundnut oil by 17.2 per cent and sesame oil by 15.6 per cent. There have been reports at times about distress sales in soyabean and mustardseed in certain centres.

Responding to alarm signals flashed by the vegetable oil industry as also by the champions of the growers' cause, the government took a series of measures to impart stability to the market. These measures included reduction in the allocation of imported oils to the vanaspati industry as also under the public distribution system, permission to use mustard solvent oil in vanaspati manufacture, procurement of mustard seed at the official support price and doubling of the stock limits for all edible oilseeds taken together held by the wholesaler and retailer.

Deep concern over the decline in oilseeds/oil prices gives one the impression as if the country has achieved a major breakthrough in oilseeds production and the era of acute vegetable oils shortage is over. Thanks to the impressive increase in mustard/rapeseed production to around 35 lakh tonnes due to certain special factors and record production of cottonseed and soyabean, oilseeds production in 1984-85 (excluding cottonseed) is expected to exceed the Sixth Plan target of 130 lakh tonnes by about five lakh tonnes. This is not saying very much really. For even on the basis of the Seventh Plan target of 170 lakh tonnes of oilseeds, the per capita availability of edible oils will work out 6.75 kg a year which is substantially below the minimum nutritional requirements.

The point has often been made that if the declining trend in oilseeds/oil prices is not checked it will adversely affect production. Not many people seem adequately aware that the Indian consumer has to pay much more for edible oils/fats than his far more affluent counterpart abroad. Vegetable oils in India have long been quoted well above international prices. But who cares for the poor consumer? What is a remunerative price for the farmer is a debatable issue. If the farmer does not get a fair price even in an economy characterised by acute shortages, it is the deficiencies in the marketing infrastructure which are mainly to blame. Agricultural production depends essentially on the availability of key inputs—water, quality seeds, fertilisers, pesticides, efficient tools, etc. Prices have a relatively less important role to play in the peculiar Indian environment.

Improvement in the overall supply position which has brought about the decline in oil prices is attributable primarily to massive imports of edible oils year after year. Interestingly enough, imports have been stepped up even as domestic production has gone up. Imports of edible oils totalled 9.98 lakh tonnes in the 1981-82 crop year, 11.50 lakh tonnes in 1982-83 and 16.34 lakh tonnes in 1983-84. Imports in the current year (1984-85) are unlikely to be less than in 1983-84. If the government is really earnest about increasing domestic production it should drastically reduce imports to meet only the requirements of the public distribution system. The supply of imported oil to the vanaspati industry must be stopped and the industry should be made to depend on indigenous oils, especially solvent extracted oils and minor oils.

The solvent extraction industry keeps complaining year after year about its declining fortunes and the increasing incidence of sickness. But still it has witnessed phenomenal growth over the years. This phenomenon is not all that intriguing as it appears. The industry comprises units engaged in processing a wide range of products—groundnut, mustard/rapeseed, cottonseed, linseed, sunflowerseed, kardiseed, soybean, rice bran, etc, and each commodity has its own demand-supply equation. The fortunes of the industry have been closely linked with exports of expellers/extractions. Except for soybean meal and rice bran extractions, exports have come down very sharply from their highest levels for a variety of reasons.

The fiscal year 1984-85 was extremely critical for the industry. Exports suffered seriously in terms of volume as well as value, more particularly in terms of unit price realisation, reflecting improved world protein supply position on the one hand and reduced demand on the other. Prospects for the current year seem even worse. De-oiled meal prices have come down by nearly 30 per cent over the past 12 months and prospects of a recovery in prices are generally rated very poor. Most observers expect prices to decline further.

The solvent extraction has been hit hard not only by the dismal export prospect but also by the continuing shortage of raw material, namely, expeller cake, which is being increasingly diverted for use as cattle-feed. According to A B Godrej, the outgoing chairman of the Solvent Extractors' Association, "the industry cannot revive from its sickness and the production of solvent extracted oils will be badly hit" unless the government comes to its help by way of "granting cash assitance of a minimum of 20 per cent of the FOB value of exports". The All India Cottonseed Crushers' Association also has pleaded for an increase in the cash compensatory support on cottonseed extractions as well as expellers to 30 per cent. Not only this, it has also asked for official support for checking the diversion of cottonseed from decorticated crushing to undecorticated crushing. The utilisation of AICOSCA members' installed capacity for decorticated crushing is stated to have declined to a mere 10 per cent. This reflects poorly on how the association is conducting its affairs.

There is nothing that India can do to influence international markets which are becoming increasingly competitive. The solvent extraction industry will have to depend increasingly on the home market. Sustained efforts will need to be made to promote the use of extractions instead of expellers for feeding cattle. The potential is immense.

Despite the declining fortunes of the industry—it is the old units which have been the worst affected—new units have been set up rather rapidly over the past few years, a few in the private sector and others in the co-operative sector or under the auspices of the government agencies. Central and state subsidies, easy availability of land and financial assistance and various tax benefits—all these have contributed to the creation of new capacity. In view of the heavy under-utilisation of installed capacity, the need for stricter appraisal of new projects can scarcely be over-emphasised.

It is contended that the resumption of futures trading in caster will help achieve, among other objectives, increase in exports. The international environment being what it is there is little chance of castor oil exports this year reaching anywhere near the 1984-85 figures of one lakh tonnes valued at Rs 115 crore—an all-time record achieved in a year when the export trade did not enjoy any hedging facility. The usefulness of hedge trading depends partly on the structure of the hedge contract and partly on how speculative activity is contained within healthy limits.

The point needs to be made that if the government is keen on boosting exports, there is no reason why the trade should be debarred from exporting castor oil to the rupee currency area countries, especially when it has acquitted itself well in exporting oil to the admittedly more difficult free currency markets. Private trade does seem to have performed rather better than STC in selling castor oil abroad.

## *Sugar*

## Getting Out of Control

THE spurting price of sugar in the open market—sugar is retailing this week at around Rs 8 per kg—may well reach an unprecedented peak in the coming festival season.

The industry had estimated right from the start of the current sugar year, i e in October 1984, that the demand-supply gap would be about two million tonnes. Obviously the Union government too must have been well aware of this situation, at least after the crushing period had ended. At the end of May 1984 the stocks totalled 3.7 million tonnes. This quantum will possibly meet the requirements till October 1985, given the normal monthly releases of about 0.7 million tonnes. So it was evident that at least two million tonnes of the sweetener would need to be purchased from abroad to provide for the first couple of months of the 1986 sugar year, when there is little fresh produce being milled, as well as for the additional releases made for the festivals. Yet the government has so far decided to import only 0.9 million tonnes (involving a foreign exchange outlay of over Rs 180 crore). The government will hence have to buy more sugar from abroad unless it is willing to risk a phenomenal rise in price.

The decision on the quantum of import has not been taken at one go, so as to dampen speculative activity over the commodity, but in small bits; like the decision last month to import a further 0.1 million tonnes. The government has been ostensibly doing this to clinch barter deals with the suppliers of sugar. But whether or not such deals are favourable to India, especially when the effect of the shooting domestic price of sugar is also taken into account, is a moot question.

Then there is the seemingly paradoxical situation of the price of sugar pushing upwards despite larger releases of sugar into the open market. The jump of over Rs 100 per quintal in the wholesale price witnessed in the last couple of weeks is to an extent an outcome of the manner in which the imported sugar is being distributed. Of the 0.38 million tonnes ordered to be released into the open market in June by the government, 0.13 million tonnes was from imported stocks and the rest from the mills. As much as three-fifths of the imported quota released for the month was auctioned off by the Food Corporation of India. The auctioned sugar was grabbed by traders, paying prices between Rs 574 and Rs 600 per quintal. This obviously aggravates the prevailing scarce condition in which the traders then hope to make their killing. The rest of the rleased 50,000 tonnes of imported sugar was to be sold through the state governments. Some of the state governments were reluctant to lift their quotas; the Maharashtra government, for instance, reportedly surrendered its allocation of 11,000 tonnes. The net result of the cornering at the auctions and the state government's reluctance was a sharp fall in the effective supply of free sale sugar from 0.36 million tonnes in May to around 0.25-0.30 million tonnes in June, i e, essentially the quantum that the mills were ordered to release during the latter month. Here the assumption of course is that the mills obeyed the release orders, even though there are reports of mills also holding on to stocks for speculative gains. The mills too would have gained from the higher returns secured for their free sale quotas, since the 'smaller' release in June considerably accelerated the rise in price of sugar which was in any case steadily rising due to the environment of scarcity.

Till March 1985, i e, till the Assembly electins were over, the sugar policy was oriented towards containing the free sale price. Now the attitude of the Union and some state governments appears to have changed to helping the traders and millowners in their speculative activities.

## LETTERS TO EDITOR

# Bhopal Victims: Treatment and Relief

IT appears that D R Varma (May 11) had not been aware of the developments in the wake of the Bhopal tragedy, when he criticised Padma Prakash's recommendation (April 6) of Sodium Thiosulphate (NTS) therapy for a group of gas victims. Padma Prakash did not try to shift the debate "from the real issue of systematic rehabilitation of these victims to one of finding some miracle treatment". The real issue of rehabilitation has not only been very much at the centre of the debate, but still remains the central issue around which all other demands are voiced by the victims. Padma Prakash did a very good job emphasising the issue of medical relief which not only still plagues the victims but has continuously been underplayed and often ignored by the government and a few official medical personalities.

On the other hand, it appears that Varma, like so many in our country, posits the question of medical relief in opposition to that of rehabilitation as if one is an alternative to the other. His arguments against NTS therapy are based on dubious premises. He assumes that only MIC was leaked during the disaster, which is only Union Carbide's version, but no one has yet established that Hydrogen Cyanide or Phosgene were not leaked out. His other assumption that infection "will occur more frequently in the gas victims" has already been proved wrong in Bhopal. Very few of the victims suffered from secondary infections and even the animal carcasses took an unusually long time to putrefy. Finally, his conclusion that routine administration of NTS is potentially harmful is a misleading statement for the simple reason that no one has advocated routine administration of NTS and concerned scientific opinion is almost universal that the NTS is one of the safest drugs. Controlled study has revealed substantial clinical improvement and NTS administration has been found to be followed by increased excretion of Thiocyanate in the urine. It is not yet certain whether the cyanide inactivated the Haemoglobin in the red blood cell or got attached to any other cell organelle.

Varma's veiled innuendo regarding the doctors of Bhopal for their "ramdom trial of drugs" should have been directed towards Union Carbide which had suppressed all information about the exact nature and biological behaviour of the gas(es) and the medical management of their poisoning. In fact, the concerned doctors had to collect such information from other available sources after much delay and to proceed with trial and error at every step of medical relief.

## CPI(M) and Its Cadres

IF Saroj Mukherjee (May 18) has to deny having used the word 'stepmotherly', he has to direct his denial to other quarters. He was reported to have used this very word, given in direct quotes by me, in an *exclusive* interview published in *Telegraph*, Calcutta, of April 23. On this and the other point of the failure of the CPI(M) ranks to discharge their share of responsibilities, Mukherjee said in his reply to the very first question of the *Telegraph* correspondent as published in the newspaper:

> One of the problems has been the leadership's failure to politically educate the low-level cadres. The result is that they have always been on the defensive in their struggle against the Centre. They have got to launch an offensive. But they cannot since they don't know how to do it. Only political education can make them see things in their proper perspective. During the Lok Sabha polls the cadres could not explain to the people how the state was suffering *due to the Centre's stepmotherly attitude*. For example, they should point out that the Centre has been ignoring our demand for nationalisation of the jute mills despite the struggle of the jute workers. They should underscore the Centre's failure to ensure the distribution of at least 14 essential commodities at fair prices. (Emphasis added.)

Subsequently, while denying that the CPI(M) cadres in West Bengal were isolated from the people, Mukherjee reiterated:

> As I have already said, the problem is that the cadres cannot answer political questions properly. This has been a major lapse.

Even a formal admission of the failure of the leadership to educate the ranks is at the same time a polite and 'correct' way of underscoring the failure of the ranks to get educated. This is more so in this particular interview as the only specific issue of political education mentioned by Mukherjee is that of the Centre-State relations, which is almost the sole issue on which the CPI(M) leadership in West Bengal harps most of the time.

Saroj Mukherjee seems to be fully satisfied that the West Bengal CPI(M) leadership has done its bit of introspection. This correspondent may be pardoned if he exercises his own judgment in evaluating this claim and finds the introspection very much inadequate as the party has not re-examined the basic framework of its current policies.

One need not respond at this stage to Mukherjee's speculation whether the quotes from Ajoy Ghosh in my piece were out of context, insinuating though it is.

OUR CORRESPONDENT

Calcutta.

# The UN System

### Romesh Thapar

WHEN Indira Gandhi, as Chairperson of the Non-Aligned Movement, sent her Foreign Office emissaries to the various Capitals of the world requesting Heads of State to attend a summit meeting at the United Nations last year, the response could not have been more depressing. There was no interest because there was no agenda. Even President Mitterrand of France, who had been prevailed upon to attend by the personal appeals of the Indian PM, didn't ever decide what was the purpose of it all.

Interestingly, our Foreign Office has over these post-Indira months avoided a self-critical exercise on that aborted operation. The reason is obvious. Who is going to say that it was a mistake to project the Chairperson in an opportunistic way? Even the non-aligned States know what the game is about and want to remind India that Chairpersonship was thrust upon it only because Iraq was caught in the tentacles of a Khomeini-type war. In other words, the third world is not for exploitation. Rajiv Gandhi must have learned this the hard way during the festivalising in Russia, North Africa, Europe and the USA.

But a self-critical exercise of value to the PM could have been possible if it had somehow steered the argumentation into the critical area that should be the concern of the Non-Aligned Movement—the reorganisation and restructuring of the United Nations and its agencies. After all, these non-aligned nations today command almost mandatory power within the organs of international diplomacy and could, with sensitivity and skill, find answers to the veto power of the so-called Great Powers in the interests of peace and development. However, such an exercise requires the kind of hard work which we do not seem any more capable of. Even the aged spark plugs of the Foreign Office, associated annually with a variety of UN Commissions and Committees (and paid handsomely for this!), are not really prepared to raise the questions and issues that catalyse change. The younger activists in the system are also not able to launch off on such an exercise without solid political support.

We are caught in a stalemate at a time when moves are afoot to make the UN and its agencies more important than they already are. The corruption within the UN system, and the unprincipled vested interests which now control the thinking and action of the various networks, have given the USA the opportunity to justify its threat of financial boycotts. More such actions could develop, and with the support of the allies of Washington. The response of the third world is terribly confused and peripheral.

Interestingly, UNESCO and UNCTAD, two thorns in the side of the affluent West, are under assault. Many of the charges are valid. The salary bills and the mafias that have come to rule these organisations are a disgrace and no one in his right senses can defend the prevailing situation. But the palliatives that will be offered will be carefully doctored to restore the supremacy of the West, and this will become inevitable unless the non-aligned get beyond demonstrative exhibitionism.

India, as Chairperson of NAM, should be moving to establish an independent commission of experienced persons from the third world to draft proposals for the reform of the UN system, reform that will link to the qualitatively new challenges which are facing our world. Considerable skill is available in the field to the non-aligned nations, and there will be many in the West who individually would only too willingly be associated with such an effort. Why are we so insensitive to this need? Are we only interested in the inane propaganda of the PR visits? Does a real initiative to discuss the future of the United Nations system cause boredom?

Frankly, the flunkeys who hang around the centres of power haven't even tried to gauge the interest. This is certainly true of India, and I presume we would have noted certain vibrations if other nations had begun to tick on these problems. In the old days, when power and influence were very limited, a Nehru, a Nasser, or a Tito could re-focus the attention of world statesmen. In later years, at another level a Palme, a Trudeau or a Boumedienne, could do likewise. What ails the political performers of today?

The task is very much easier. The global confusion is extraordinary. The UN system is unable to make even a dent on any problem of immediate concern to the people. Block voting has made a mockery of the procedures. The pre-programming is such that even the speeches of various representatives could be prepared by computers. And, yet, there is grave turmoil wherever one turns, from ecological challenges, to nuclear threats, from technological blackmail to hidden discriminatory trading. And even the last blatant colonialism—of the oceans—is being attempted by the powerful. With majority voting power, the non-aligned world makes no impact.

As in politics, so in diplomacy, rhetoric has taken over. There are no detailed and persuasively phrased position papers because even those equipped to prepare them are robbed of accepted international perspectives. No research is being sponsored to build the necessary background knowledge of the changed global situation. Even speculative scenarios on the possible tangles developing around us and further away are seen as foreign-inspired intellectualising. It is no wonder, then, that we move only in charismatic frameworks.

For what it's worth, an activisation of the global problems which should concern the NAM might yield dialogues of immediate value to this sub-continent and prepare the way for those understandings which we have long sought in our region. The present charisma peddling of Indira's son is a worthless and barren exercise, and the sooner we begin to puncture it the better. In fact, we would not be damaging India, but improving its image as something beyond the manipulations of a single family.

But, let us remember, that the job will not be done by political operators claiming to be professionals. Specialists are called for, persons capable of expressing themselves without that eye fixed on the political patron. It is necessary to say this because ruling non-aligned coteries tend to stop the search for talent within their backyards. What with heavy security, these are now rather under-populated.

A breakthrough in this area is of vital concern to the non-aligned world, and it can be achieved if our Foreign Office is directed precisely. *June 28.*

## Gujarat Binil Chemicals

GUJARAT BINIL CHEMICALS, a joint sector company, is setting up a Rs 299 lakh project for the annual manufacture of 2,200 tonnes of engineering thermoplastics like acrylonitrile butadiene styrene (ABS) at Ankleshwar, a notified backward area in Bharuch district of Gujarat. To raise a part of the finance required for the project, the company is making a public issue of 4,85,100 equity shares of Rs 10 each at par. Of this issue, 48,500 shares have been reserved for preferential allotment to non-resident Indians. The subscription list for NRIs will open on June 25 and for the Indian public on July 2. The issue is managed by the State Bank of India. V B Desai is advisor to the issue. The company has been promoted by two non-resident technocrats, Anil K Kumar (Managing Director) and Bipin Dalal in association with GIIC, a Government of Gujarat undertaking. ABS is a versatile material widely used in automobiles, electronic and electrical appliances, communication equipments, refrigeration linings, moulded luggage, textile machineries, shoe industry, etc. The technology to be employed is a semi-continuous polymerisation process which ensures flexibility in changing from one product to another without any product loss. This is the only multi-purpose plant in India at present capable of producing, in addition to ABS, other thermoplastics like SAN, HIPS, etc. The close loop system and the automatic control panels enable the plant to produce the finished product of desired quality without any process loss.

# Sound Base for Expansion

**Hansavivek**

*ASIAN PAINTS (INDIA)*, the largest paint manufacturer in the country, has fared so well during 1984 that the board has recommended a three-for-five bonus issue besides stepping up dividend by 5 points to 30 per cent. What is more, the company has planned expansion and diversification of activities to accelerate future growth. On a turnover up from the previous year's Rs 69.38 crore to Rs 91.24 crore, the company has earned a gross profit of Rs 12.08 crore against Rs 9.68 crore. These figures reflect a small contraction of profit margins. But this performance looks all the more encouraging when viewed against the background of critical availability of input materials and the inflationary trend in prices of all raw materials and containers and packaging goods. The company was able to achieve export sales of Rs 2.25 crore, almost double last year's figure. Net profit amounted to Rs 5.36 crore (Rs 3.69 crore) and the earnings cover for the enhanced distribution increased from 2.80 times to 3.40 times. The company's liquidity position continued to be comfortable and income earned through investment of short term surplus funds amounted to Rs 1.11 crore.

In the company's overseas operations, the Fiji subsidiary, Asian Paints (South Pacific), could maintain dividend at 12.5 cents per share of Fiji $ one in view of the Counter Inflation (Dividends) (Control) Order, 1984. The demand for paints in the market returned to its normal level after the heavy demand witnessed during the previous year arising from reconstruction activities following hurricane 'Oscar'. Introduction of two new product lines, namely, marine paints and automotive paints enabled the company to restrict the shortfall to the minimum. The subsidiary in Tonga, Asian Paints (Tonga) has announced a dividend of 20 cents per share of Tonga $ one following higher sales and profits. The company's proposal to set up a joint venture unit with an installed capacity of 400 KL of paints and enamels in the Dominion of Solomon Islands in South Pacific received final approval of the Government of India in October last. The building construction work has commenced and is expected to be completed by October this year. The company's proposal to set up a joint venture unit for the manufacture of 750 KL of paints, enamels and varnishes in the Kingdom of Nepal also received final approval of the Central government. The building construction work has been completed and the equipment is under installation. The plant is expected to be commissioned shortly.

Meanwhile, work on the company's paints project at Patancheru in AP is proceeding on schedule and the first phase is expected to be commissioned shortly. ICICI and SBI have sanctioned term loans aggregating to Rs 1.75 crore for the project. The technical collaboration agreement signed by the company with Devoe Marine Coatings Company was taken on record by the Central government and the technology packet was obtained in August 1984. Work on indigenising the process and formulations is in progress. The company has joined hands with Tamil Nadu Industrial Development Corporation for establishing a joint sector company under the name 'Pentasia Chemicals' to implement a project for the annual manufacture of 3,000 tonnes of pentaerythritol and 1,800

tonnes of sodium formate. The plant, proposed to be located in the backward area of Cuddalore, 190 kms away from Madras, is expected to go on stream before the end of 1986. The company itself consumes substantial quantities of pentaerythritol. Certain grades of this material are also needed by the explosives and drilling industries. Sodium formate is largely used by the chemical industry. The new company is thus assured of a good market for its products. Effluent treatment facilities at all the company's plants are being evaluated and where necessary will be upgraded to meet the required standards.

*HINDUSTAN CIBA-GEIGY* has become an Indian company with further dilution of the equity holding of its parent company, Ciba-Geigy of Switzerland, to 40 per cent by offering 1,94,783 shares of Rs 100 each at a price of Rs 175 per share to existing Indian resident shareholders on a pro rata basis. This should help in the expeditious disposal of the company's requests for issue of industrial licences. The company has so far not received the letter of intent for the manufacture of Isoproturon Technical, a wheat herbicide, and its formulations despite active follow-up by the management. Also, it is expected that the letters of intent for the manufacture of new drugs, *viz*, Trasicor and Voltaren, besides Cibemid a new compound discovered at the company's Research Centre at Goregaon in Bombay, will be expedited. The company commissioned during 1984 the project for the manufacture of EPN resins and the unit is in regular operation. The project relating to organic phosphates and phosphites was commissioned in March last. The letter of intent in respect of the polyurethane project is likely to be converted into an industrial licence shortly and the products are expected to be launched during this year. Work on the textile auxiliary and synthetic tanning agents project is already in progress on schedule. At the company's plant at Bhandup in Bombay, a multi-divisional process technology R and D project consisting of a new pilot plant and several laboratories, has been completed and partially commissioned.

The company has shown good results for 1984 with turnover rising from the previous year's Rs 98.65 crore to Rs 112.53 crore and gross profit from Rs 10.25 to Rs. 11.73 crore. Net profit has risen from Rs 4.95 to Rs 6.28 crore and the unchanged dividend of 15 per cent was covered 2.36 times as against 2.21 times previously. Sales of pharmaceutical products in the domestic market increased appreciably by about 26 per cent over 1983. Regestrone, a product for gynaecological disorders launched late in 1983, has been doing well. Aubril, a drug indicated for common bacterial infection, was launched during 1984 and the market response has been encouraging. The company, however, discontinued the manufacture of Mexaform, Entero-Vioform and Entobex from the end of March last in the wake of recent changes in medical thinking. Favourable industrial market conditions helped the company in lifting up its sales of epoxy resins by 24 per cent over 1983. Sales of consumer products, agricultural chemicals and dyes and chemicals maintained a satisfactory rate of growth. The company's export turnover amounted to Rs 17.16 crore against Rs 16.90 crore in the previous year. A long term wage settlement for four years beginning 1983 was concluded with Dyes and Chemical Workers' Union, Bombay. Negotiations on the charter of demands submitted by the company's employees in the Santa Monica establishment in Goa is in progress and a settlement is expected to be reached soon. M K Mong-Hansen took charge of the office of Managing Director on May 21, 1984 after receipt of the Central government's approval of his appointment.

*CYANAMID INDIA* has registered an impressive increase in profit margins during 1983-84. Its gross profit has expanded from the previous year's Rs 206 lakh to Rs 387 lakh following increase in sales from Rs 27.32 crore to Rs 32.12 crore. Although taxation has taken away considerably more, net profit is Rs 201 lakh against Rs 104 lakh. Dividend has been stepped up from 12 to 25 per cent and is covered 1.76 times by earnings as against 1.89 times previously. The management attributes higher earnings to sustained growth in the agricultural division, while the pharmaceutical division continues to be under pressure due to price constraints. A rigid price control programme could enable the latter division to just break even. Exports amounted to Rs 30 lakh against Rs 20 lakh in the previous year. The writ petition filed by the company in the Delhi High Court, challenging the legality and validity of fixation of prices of bulk drugs and formulations, has been finally disposed of in favour of the company. A special leave petition of appeal, filed by the Government of India in the Supreme Court, for a stay on the order of the Delhi High Court, has been rejected. Accordingly, the undertaking given by the company stands discharged. The applications for regularisation of productive installed capacities in respect of bulk drugs (tetracyclines) and pharmaceutical formulations are still pending with the government. In terms of the notification of April 21, 1982, the government has re-endorsed higher capacities in respect of bulk drugs (tetracyclines) and some of the antibiotic formulations, subject to fulfilment of certain conditions. The company has appealed to the government for waiver of some of the conditions. In terms of the notification, the government has re-endorsed the capacity of phorate technical upto 595 tonnes. The joint venture proposal to manufacture ethambutol, an anti-TB drug, could not materialise as the terms for transfer of part of the technology by a third party were found to be unsatisfactory and not in the interest of the company.

*APOLLO TYRES* has shown poor working results for the year ended October 1984 with a drop in gross profit from the previous year's Rs 456 lakh to a mere Rs 57 lakh following slightly lower sales of Rs 38.74 crore against Rs 39.15 crore. Profit margins have tumbled. The company's operations were affected mainly due to industrial relations problem at the factory at Perumbra in Kerala, spread over a period of 2½ months resulting in a production loss of Rs 18 crore. The cost of inputs also increased, but the increase could not be passed on fully to the consumers due to the demand recession. The Central government reduced marginally the excise duty for four months in respect of certain types of tyres which gave rise (temporarily) to the demand for these tyres. The interest of Rs 207 lakh and exchange difference of Rs 25 lakh on loans availed for acquisition of fixed assets have been capitalised so as to reflect the correct cost of assets. The profit as well as some prior period adjustments amounting to Rs 14 lakh have been utilised to reduce the accumulated deificit to Rs 1.74 crore. No provision has been made in the accounts for depreciation for the year amounting to Rs 4.55 crore for want of adequate profits. Arrears on this account now amount to Rs 12.19 crore. The company has finalised arrangements with financial institutions and banks to finance the implementation of the increase in installed capacity from 4.41 lakh numbers tyres to 5.52 lakh numbers per annum. The company was able to make a breakthrough by securing export orders worth US $ 5 million from the USA besides other export orders. The company proposes to offer by private placement in the near future 3,63,700 forfeited equity shares which will add Rs 27 lakh to the equity capital.

*PANTAPE MAGNETICS*, a new company, is setting up a project to manufacture audio magnetic tapes in the first phase and audio cassettes in the second phase. The company has an industrial licence to manufacture annually 1,000 MRM ¼" width audio magnetic tapes and conversion of 50 per cent of the actual production of the audio magnetic tapes in a calendar year into C-60 equivalent audio cassettes, subject to a maximum of 12.5 million numbers. The company has entered into technical collaboration agreement with Certron Corporation, USA, a leading manufacturer of magnetic tape products. The plant is located at village Nanjangud in Mysore district of Karnataka where the company is eligible for Central subsidy, concessional finance and other incentives from the state government. The erection of plant and machinery is in full swing. Trial production is scheduled for early July 1985 and commercial production later that month. The company expects to commence production of audio cassettes by June 1986. The project cost is estimated at around Rs 3.68 crore, of which Rs 1.05 crore will come from equity share capital. The company has been promoted by K R Srivatsa, ex-IAS officer, formerly Managing Director of GSFC and Vice-Chairman and President of SPIC, in association with Bakul Jain, a young entrepreneur and grandson of veteran industrialist Shriyans Prasad Jain. The company is confident that it will be in a position to market its products at substantially lower prices as compared to the current prices of quality tapes. The current demand for audio magnetic tapes is estimated at 2,700 MRM per annum as against the domestic production of only 360 MRM. The balance demand is met through imports. The demand in India is estimated to go upto 6,700 MRM per annum by 1988. The demand for audio cassettes is also growing at a fast pace and a major portion of the demand is at present met through unauthorised imports and spurious products. Investors in the company's shares will be eligible for 80 CC and wealth tax benefits.

*INDIAN OVERSEAS BANK* has recorded satisfactory progress in 1984. Global deposits and other accounts of the bank increased from the previous year's Rs 2,729.4 crore to Rs 3,229.2 crore and advances from Rs 1,818.5 crore to Rs 2,251.6 crore. The operating environment in S E Asia, where the bank's overseas branches and business are concentrated, was by and large favourable. The bank has 12 overseas branches—seven in Hong Kong, one each in South Korea and Singapore and three in Sri Lanka. Domestic deposits of the bank increased from Rs 1,971.4 crore to Rs 2,310.1 crore, registering a growth of 15.7 per cent. The ratio of NRI deposits to total deposits was 15 per cent for the bank compared to a little over five per cent for the system. The bank's gross investments in India amounted to Rs 718.1 crore compared to Rs 627 crore a year ago. Gross credit in India went up from Rs 1,153.4 crore to Rs 1,437.1 crore. The bank's total export finance increased from Rs 91.3 crore to Rs 122.7 crore, raising the ratio of export credit to total credit from 8 to 8.7 per cent. The bank established export advisory cells in a number of branches for collection and dissemination of data on the direction and quantum of exports and other information on trade and tariff, identification of potential clients and to render all possible assistance. The bank received during the year from the President of India, the award for Outstanding Export Performance for 1980-81.

The ratio of priority sector credit to total credit improved from 36.2 to 39.8 per cent, just 0.2 per cent below the national target of 40 per cent to be achieved by March 1985. In absolute terms, the priority lendings were up from Rs 412.5 crore to Rs 558.7 crore. Advances to small scale industries increased from Rs 167.1 crore to Rs 231.2 crore. Small artisans, craftsmen and village and cottage industries continued to be accorded priority by the bank. Agricultural advances stood at Rs 250.7 crore against Rs 182.9 crore. Small and marginal farmers accounted for 66 per cent of the amount of direct agricultural advances and 84 per cent of the number of accounts. Disbursements during the year under the IRDP amounted to Rs 18.2 crore covering 73,144 beneficiaries as compared to Rs 15.9 crore covering 70,960 beneficiaries last year. Recovery as a percentage of demand under direct agricultural advances worked out to 65.7 per cent for the year ended June 1984. The bank's advances under the DRI scheme went up from Rs 10.5 crore to Rs 15.5 crore. Advances to SC/ST categories increased from Rs 20.8 crore to Rs 30.4 crore. The bank's lendings under the 20-point economic programme at the end of the year stood at Rs 168.1 crore spread over 2.8 lakh accounts. The bank opened 53 new branches in India taking the total number of branches in the country to 1,033. Of the new branches, 34 were located in rural/semi-urban centres, 31 of them hitherto unbanked. At the year-end, 702 of 68 per cent of the total branches were operating in rural/semi-urban areas. The bank has created a number of employment opportunities for the physically handicapped and has been the recepient of prizes for pioneering work in this field. The bank earned a net profit of Rs 4.82 crore against Rs 4.73 crore in 1983. Out of this, Rs 3 crore has been transferred to statutory and special reserve funds, Rs 1.56 crore set aside for bonus to employees and Rs 26 lakh transferred to the Central government.

*BLISS CHEMICALS AND PHARMACEUTICALS INDIA*, a new company engaged in indenting and marketing of chemicals, is setting up a plant for the manufacture of vaginal pessaries (spermicidal contraceptives) in technical collaboration with W J Rendell of UK, a pioneer in the field. The plant with installed capacity to produce 25 million pessaries per annum on a single shift basis is being set up at Palghar in Thane district of Maharashtra. The company has been promoted by Uday S Lele, Managing Director, who is a graduate in chemistry with over 8 years experience in the marketing of chemicals. The collaborator firm's chemical based contraceptives are presently manufactured in more than 60 countries all over the world for the past 25 years and are used by millions. The product is a non-hormonal chemical based spermicidal contraceptive which dissolves in the vagina at body temperature to form spermicidal contraceptive action. There is no loss of sensation and feeling in using it, unlike in the case of condoms. According to Lele, surveys conducted among the general public in India have indicated an overwhelming preference for vaginal pessaries over the available contraceptive modes. The company expects to have a turnover of Rs 3.74 crore in the second year of operation on a two-shift basis. The total long term funds required by the company for manufacture of contraceptives and marketing of chemicals is estimated at Rs one crore. This is proposed to be financed by equity capital of Rs 80 lakh. The company is making a public issue of 5 lakh equity shares of Rs 10 each, out of which 2 lakh shares have been reserved for preferential allotment to non-resident Indians and another 20,000 for employees and business associates. The subscription list for NRIs will open on July 3 and for the Indian public on July 10. The Canara Bank's Merchant Banking Division is managing the issue.

*REGENCY CERAMICS*, promoted by two young professional entrepreneurs—G N Naidu (Managing Director) and K Seshagiri Rao—is setting up a Rs 12 crore 100 per cent export oriented project for the annual manufacture of 30,000 tonnes of ceramic tiles at Yanam near Kakinada in AP in technical and financial collaboration with WELKO of Italy. The Italian firm is investing a crore of rupees to acquire a 25 per cent stake in the equity capital of the new company. It will supply the equipment for the plant and has also taken responsibility for erection and commissioning. It will also extend expertise to the Indian personnel and market the products abroad through its vast network. An outstanding feature of WELKO's technology is that the cycle time for production would be reduced from 45 hours to only 45 minutes reducing fuel consumption by 40 per cent. As the largest project of its kind in Asia, it would be able to achieve economies of scale. Location of the plant in a 'backward' area would entitle the company to various concessions and incentives. The company has also the advantage of contracting half a million tonnes of second grade ballclay, the raw material, to be used at 25,000 tonnes annually from AP Mining Corporation.

The company expects to achieve 97.5 per cent of installed capacity within 2 months of commercial production. The break-even point is estimated at around 40 per cent of capacity. The collaborator has given a guarantee that the company's product would conform to international standards. The company intends to come to the market soon with an issue of 19.60 lakh equity shares of Rs 10 each at par to raise a part of the finance required for its project. The Merchant Banking Division of Indian Bank is managing the issue.

# Communal Fire Engulfs Ahmedabad Once Again

### Asghar Ali Engineer

IT was on March 18 that the agitation against enhanced reservations for the Backward Castes had turned communal when after a successful Bandh Muslim houses were set ablaze in Ahmedabad city. The communal disturbances continued for a couple of days in that phase claiming 19 lives (14 in police firing and 5 in stabbings) and causing severe injuries to 52 persons and damage worth Rs 3 crore to property. The army had to be called in to assist the civil authorities. However, by the end of March the situation seemed to be under control and the authorities felt confident enough to withdraw the army.

In fact the peace was more apparent than real. The agitators against reservation represented by a student body, Navrachna Samiti, on one hand and by a parents organisation, Vali Mandal, led by Shankarbhai Patel on the other, were determined to carry on the agitation come what may. Even if hundreds die and thousands suffer and lakhs lose whatever little they have, reservation must go so that their sons and daughters can continue to enjoy a virtual monopoly of government jobs and the lucrative professions in addition to trade and top executive jobs in the private sector. How could the *dedhias* (a derogatory term for harijans and lower castes) dare them on their own ground?

The political parties had their own axe to grind. All the opposition parties lent their support to the agitation from behind the scenes. In fact it would not be wrong to say that some parties like the Bharatiya Janata Party began to mastermind it. (That is one of the reasons for the agitation taking a communal turn again and again.) Ashok Bhatt of the BJP who was arrested under NSA is alleged to have incited agitators more than once. The agitators claim to be running the agitation on peaceful lines and hold the government and the ruling party wholly responsible for the continuing violence, both caste as well as communal.

However, things are not as simple as that. Certainly, one cannot exonerate the government and the ruling party of their share of the blame. After talking to a large number of people in Ahmedabad and Gandhi Nagar, one cannot but conclude that a section of the ruling party has been involved in provoking violence with a view to dislodging Chief Minister Solanki. Solanki's supporters too have played a highly dubious role as we will show a little later. Add to this the incompetent handling of the whole situation by the administration and you have a picture of the role played by those in charge of running the government.

The opposition parties, particularly the BJP, have played by far the most important role in the continuing violence, particularly the communal violence. The main obsession of the opposition parties and the dissident faction of the ruling party has been with removing Solanki from power. This can be accomplished only by continuing the violence, caste or communal. Caste violence has lost its momentum. Communal violence is easy to perpetrate and hence innocent Muslims have become the major target.

## GOVERNMENT'S INCOMPETENCE

Solanki's government acknowledges this but seems to be helpless and incompetent to handle the situation. This author with Chandrajit Yadav, Ram Paswan and Syed Hashmi, all MPs, pointed out to Solanki on June 22 in Ahmedabad that if he failed to control the communal situation he might have to go in an embarrassing situation whereas if he had to go on the reservation issue he would be seen to be going down fighting for a cause. Solanki agreed with this view and said that he was going to take very stern measures to curb communal violence. However, the very next day in addition to others a young Muslim girl aged 22 was stabbed to death in Zaweriwad (one of the strongholds of communalists in the walled city) and in the same area an aged Muslim lady, around 70 years old, suffered acid burns which affected her eyesight.

One must admit that the situation is extremely precarious and, in view of the geography of Ahmedabad, extremely difficult to control. The narrow lanes and byelanes and *poles* (extremely narrow subbyelanes within byelanes) make the old city ideal for hit and run tactics and for harassing the police and army and evading arrest. The miscreants have fully exploited this situation. Even the army seems to be failing in its mission. What was particularly shocking was that even the army was getting partly communalised. I have had the opportunity to investigate many major riots but in no other instance have I ever heard any complaint against the army. I was told by a young Hindu gentleman whose secular credentials I have no reason to doubt since his whole family is known to me very well that while combing the Vadigam area in Daryapur for weapons on May 14 army personnel are alleged to have asked the Patels (the area is mainly inhabited by Patels from North Gujarat) to hide their arms and pretended not to have found anything. The newspapers also carried reports that nothing had been found during the combing operations.

Before we throw light on the communal incidents I would like to discuss the caste aspect with which the whole agitation started. The Bakshi Panch, as is well-known, had identified more than 80 Backward Castes for grant of reservation, among whom there were 22 Muslim castes as well. More than 70 per cent of the Gujarat population today comprises these castes, including the Scheduled Castes and Scheduled Tribes, and if all the Muslims are included then about 80 per cent of the population would come under these categories.

It is widely believed that the Congress(I) could get a thumping majority in the last assembly elections under the leadership of Solanki largely on account of the enhancement of reservation by 18 per cent about two moths before the elections. Out of 149 elected MLAs, 125 belong to these Backward Castes, classes, Scheduled Castes, Scheduled Tribes and minorities. However, according to Lakshman Patni, an MLA belonging to Waghri tribe, not even 10 MLAs are now active in countering the moves of the anti-reservationists, let alone launching a counter movement in favour of reservation. It is a very sorry state of affairs.

## NO COUNTER-MOVEMENT

There are various reasons for this. One of the most important reasons is that these castes and tribes are by and large unaware of the reservation benefits extended to them. This was borne out by Sujata Patel who has carried out some sociological research in Jamnagar district. On questioning many persons belonging to these castes she found them quite unaware of any reservation, let alone any enhancement. Also, the rate of literacy among them is abysmally low and the question of taking up government jobs hardly arises. Also, the Backward Castes and specially Harijans and tribals are very dependent on the upper castes economically, much more so in rural areas, and find it very difficult to oppose the upper castes.

The MLAs who no doubt get elected on the strength of their belonging to the Backward Castes too are in many ways dependent on the upper castes and can hardly get away from this reality. The reality is, therefore, much more complex and has to be understood in all its complexities. Even Solanki who is said to have won the elections on the basis of the Backward Castes' and Muslims' support has his strong links with upper castes and classes. His ambition to convert Gujarat into a 'mini-Japan' cannot be realised without strong support from the capitalist class (which consists of only upper caste groups) of Gujarat. His ready compromises with the upper caste agitationists must be seen in this light. On one hand, he needs the support of the Backward Castes for electoral success and on the other he depends on upper caste capitalists and senior bureaucrats for the survival of his government. It is very difficult to get out of this dilemma. So one should not be very surprised if a counter-agitation is not developing in Gujarat. Also, as pointed out above, it is in the interest of the present political leadership not to allow any powerful counter-movement to grow. A Congress(I) functionary at the Zilla Parishad level belonging to a backward shepherd caste told me that in his district he could easily mobilise a large number of Backward Caste people, especially those belonging to his caste, but he had been restrained by his political bosses as "it would lead to bloodshed of unprecedented nature".

It is also important to note that the anti-reservation agitation is limited to a few urban centres like Ahmedabad, Surat and Baroda, though there has been cases of violence in some rural districts like Mehsana, Anand and Viramgam. Ahmedabad, Surat and Baroda are not only politically important in Gujarat, they are also powerful centres of Patel domination. In Surat the violence was restricted to the areas of Kadva Patels who are playing by far the most important role in the whole agitation. The whole agitation is not only led but also mainly financed by the Kadva Patels. Their vehemence can also be understood if we keep in mind the fact that their share in government power has gone down over last decade. During the 1981 agitation also it was Kadva Patels who were the most belligerent in their attacks on the Scheduled Castes.

Another reason why a counter-movement has not grown is the mutual antagonism among the various Backward Castes. They are still far from being aware of the need for mutual solidarity to defend their rights. Idealistic projections and simplistic assumptions will not help. We came to know of many instances in which one or the other Backward Castes fought against the Scheduled Castes in the current agitation. The Waghris, for example, are alleged to have attacked the Dalits (i e, followers of Ambedkar) in Jagjivan Ram Society on May 14, in which attack two persons were injured. One Dalit youth alleged that "Laxman Patni, the MLA, was behind the attack". Patni is a Waghri. This may or may not be true but the fact remains that the Waghris attacked the Dalits. The reason given was that the Waghris were paid for the attack by the Patels.

This was no isolated instance. The Harijans in Ashok Mill Ni Chawl were attacked and their twelve houses burnt on April 22 by the Barots, another caste identified as backward by the Bakhshi Panch. They also allegedly attacked at the instance of the Patels. Such instances can be multiplied. These instances demonstrate that even in Ahmedabad city the Backward Castes are not aware of the benefits of reservation extended to them and are prepared to act as mercenaries against Dalits and other fellow Backward Castes. It would be very difficult to bring about unity and solidarity among all the Bakhshi Panch castes.

### DALIT-MUSLIM RELATIONS

However, there is a perceptible difference in the relations between the Muslims and Dalits. (Dalits in Ahmedabad mostly belong to the Vankar caste.) In 1981 Vankars had borne the main brunt of the riots. Though the Muslims did not suffer then they had stood by the Dalits and in many cases had extended support to their cause. Many Dalit leaders had told me then (i e, in 1981) that they would not now become willing instruments of caste Hindus to kill Muslims as they had done in the 1969 riots. During the current riots Muslims and Harijans have both suffered heavily (the former have suffered much more in the later phases, i e, after the second week of May) and the sense of unity among these two oppressed groups is growing. Most of the Dalit leaders I talked to expressed their feelings of unity with the Muslims. An instance was brought to my notice in the Aman Chowk (Bapunagar) relief camp where a Dalit neighbour saved five Muslim houses from being burnt by putting the Swastika sign and Ganesha's pictures. However, one should refrain from overdrawing the picture of unity among the Dalits and Muslims, in view of centuries of apathy, indifference and even mutual hatred. The upper castes, moreover, are always scheming to bring about disunity among them. But it is becoming increasingly difficult for them to achieve their objective.

The Scheduled Caste government employees are the most radicalised among all sections. It is they who are highly educated and have benefited the most from the policy of reservation. They seem to be determined to protect their interests. Feelings run very high among them and they were found working much more vigorously to face the upper caste government employees' agitation against the roster system. A deputation of these employees led by Pravin Rashtrapal, President, Gujarat Backward Class Government Employees' Association, met us to present their grievances. Rashtrapal, who is an income-tax officer, was critical of Solanki's suspension of the enhanced reservation quota. He also condemned the upper caste bureaucracy which was fully sympathetic to the anti-reservationists. He wondered how the government was tolerating a strike by Class I officers. Even the officers of the rank of deputy and joint secretaries had joined the strike. How could they make a grievance of the roster system, he wondered. The bureaucracy had paralysed the whole administration as its sympathy was with the upper castes, he maintained. He also accused the government of being soft towards traders and industrialists when they went on their five-day hartal. Could not government have cancelled the licences of traders under the Gumashta and other Acts had it been serious? The government comes down heavily when poor workers go on strike or landless labourers agitate. Rashtrapal's militancy and anger were quite representative of the feelings of other Dalit employees present at our meeting.

Why the agitation turned communal is a difficult question to which no definite answer has been forthcoming. In the report on the first phase of rioting (*EPW*, April 13) we had discussed certain theories current at that time. The opposition parties and all those opposed to the Solanki government blamed the rioting on the government, in particular on Solanki who was alleged to have given the violence a communal turn in order to defeat the caste agitation. Even if true to an extent, this represents a simplistic explanation for a very complexly structured situation. The situation became more complex from the third week of April when a police sub-inspector, Desai, was killed and the police openly revolted.

### OPPOSITION PARTIES' ROLE

Whatever the role of the Solanki government and whatever its sins of omission and commission, the opposition parties, particularly the BJP, has played no less an important role in provoking communal violence. It played this role from behind the scene and very cleverly. The present investigator had long discussions with a number of prominent people from various walks of life, in addition to putting probing questions to the victims of communal violence.

The first phase of communal violence lasted from March 18 to 25. Eye-witness accounts show that the Patels started throwing stones from Salepari on Nagina Pole which is a Muslim area on March 18 evening. Thereafter stoning started from Vadigam, another nearby locality of Patels. It was also

pointed out that the police strength on the corner of Nagina Pole was reduced on the evening of March 18. We will have more to say about the role of the police in the communal riots a little later. On the night of March 18 nearly 90 Muslim houses and 106 shops were burnt. Around 20 Hindu houses and shops were also set ablaze. As for the 27 Hindu shops burnt on Nichi Road, Fernandese Bridge, it has been pointed out that this was the result of fire spreading from the burning Muslim shops.

Here it would be interesting to throw some light on the socio-economic factors which have also been partly responsible for giving the agitation a communal turn. Several cloth mills are closed in Ahmedabad and around fifty thousand workers are unemployed as a result. Of these unemployed, nearly one-fourth are Muslims and one-third Dalits. Most of them, in order to earn their living, have taken to working in illicit liquor and gambling dens and in drug trafficking. Most of these dens, it is important to note, are financed by rich Patels and Banias who have surplus black money and who are always looking for profitable avenues of investment. Most of those who run these dens are Dalits or Muslims (notorious anti-social elements) and the couriers too are also mostly low-paid Dalits and Muslims.

The police get 'hafta' from those in charge of the dens and often arrest the low-paid couriers to put pressure on those who run the dens but they never get to the 'hidden hands' of the Patels who enjoy political patronage. The Patels who finance the liquor, drug and gambling dens keep the 'dadas' who run them under control through various means including the police. Many of them have scores to settle with the unruly 'dadas'. All this is said to have played some role in communalising the situation. The Patels sought their revenue and the 'dadas' theirs. Once the violence took a communal form, it acquired its own momentum and other vested interests too joined in. In the first phase, as pointed out in our earlier report, there was not much communal tension in the city and everyone was surprised when communal violence erupted on March 18.

From March 19 to 22 some 40 to 42 pucca houses belonging to Muslims were destroyed. How casually the whole thing was taken by the police was pointed out to me by Girish Patel who is a senior advocate in the Gujarat High Court and wanted to file a writ petition on this issue. Patel had collected the names of the miscreants responsible for demolishing the Muslim houses during curfew hours and had handed them over to the Commissioner of Police. When he required these names for filing the writ he was told by the Commissioner that the paper containing the names had been lost. When the police could treat a complaint made by a senior advocate so casually, one can understand the fate of the complaints lodged by ordinary people.

We do not wish to dwell in greater detail on the communal violence in this phase as we have already dealt with it in our earlier report. The second phase of communal orgy began on April 15 and lasted upto the 29th. April 22 was the day of the worst trouble. It was when the police revolted after the murder of a head constable while he was assisting a two-member fact-finding team appointed by the Gujarat High Court in the Astodia area. After the murder of the head constable the police went berserk and started attacking whosoever came in their way. It was on this day that the offices of *Gujarat Samachar* and *Western Times* were burnt allegedly by the police.

### POLICE ATTACK ON MUSLIMS

However, it was on the same day that all hell was let loose in a labour area, Bapunagar. It is a vast sprawling labour colony divided into several parts known as Indira Gharibnagar, Sanjaynagar, 16 Blocks, etc, and is surrounded by the multi-storeyed buildings of affluent Patels known as Anand flats (behind Indira Gharibnagar), Mangal flats (behind Sanjaynagar) and Bhaiyyas on the one side and of some Maharashtrians on the other. The inhabitants of Indira Gharibnagar and Sanjaynagar as well as of 16 Blocks are mostly non-Gujarati Muslims from AP, UP, MP, etc, and are employed in nearby industries or do odd jobs.

The area had been under curfew for quite sometime though there was no visible communal tension, according to many inhabitants. However, curfew was lifted in the area on April 21 and three Muslim constables were sent away from the area. This action speaks volumes about the role of the police authorities and their real intentions. There is no doubt that the police officers played an openly partisan role in the whole episode of Bapunagar.

Though there was no visible tension in the area, the Muslims were feeling insecure. They approached the inmates of Anand flats who assured them that they need not fear and they together formed a peace committee on April 21. The Patels even offered to protect Muslims in the event of any trouble. The trouble began at 3 pm on April 22 when some small shops belonging to Muslims were set on fire near bus stop number 137. A holy shrine known as Malik Sh'aban ki Dargah, an old and sturdy structure, was extensively damaged and a nearby mosque too was ransacked. The Muslims in Sanjaynagar and Indira Gharibnagar were panicky, but they could do little except contact the police which kept reassuring them. By 6 pm a well armed mob collected near Sanjaynagar and, according to many eye-witnesses, many of these armed people came in police jeeps. The Muslims collected to resist but were outnumbered and had to run for their lives.

Soon the panic spread among the Muslims of Indira Gharibnagar as well. When they contacted the police they were also told that there was nothing to worry about. Aisha Begum, former Education Minister, also came to know of the disturbances in Bapunagar and contacted the police. On being told the same thing she contacted Amarsingh Chowdhary, the Home Minister, but got the same reply. Thus neither the police nor the Home Minister cared to take effective steps to avert the disaster which was to follow.

At 4 am on April 23, according to Munawwar Khan, a resident of Gharibnagar, stoning started from Anand flats. The Muslims were totally surprised as the residents of Anand flats had assured the Muslims that nothing would happen to them and a peace committee had also been formed. Muslims now realised the gravity of the problem and again contacted the police but were told not to worry. They retaliated to some extent but could not do much. Soon a police and SRP force gathered in a maidan opposite the Gharibnagar tenements and began to fire at the Muslims. According to eye-witnesses, the police officers even supplied petrol from their jeep and motor cycles to the miscreants to set fire to Muslim houses and shops in the area.

A number of police officers have been identified and even the Chief Minister and the Home Minister, when I asked them, could not deny the role of these police officials. The Chief Minister said that he had transferred one of the officers as a punishment—what a punishment for the havoc caused!—but on inquiry it turned out that it was another officer who had been transferred. As a result of the police firing about 20 Muslims were killed and 93 were injured either in the police firing or in assaults by goondas. Among those killed were a woman and a doctor. The police's role was most condemnable. Instead of protecting innocent lives against a mob bent upon mayhem, the police turned themselves into an integral part of the murderous mob and fired to kill people fleeing out of fear. Even children were not spared. The Solanki government seems to be helpless in dealing with its own police.

It is also alleged by some observers of the murderous scene on that day that some lower level Congress(I) functionaries, who have connections with notorious local slumlords, were also active. Rajendra Anchal and Ramlal Pehalwan were named in this connection. The latter, a slumlord, had played a notorious role in the 1969 riots also. It was also alleged that a Congress(I) MLA who is close to Prabhod Rawal, the ex-Home Minister, protects them. A Congress(I) Corporator also helped the miscreants. When Harubhai Mehta, a Congress(I) MP was told about this and he asked the Corporator for an explanation the latter is reported to have said, according to Dhirubhai Patel, a Sarvodaya social worker, "I am a Hindu and it is my duty to protect the interests of Hindus". It is alleged that the Congress(I) Corporator along with the local slumlords has an interest in the land occupied by the Muslims in Bapunagar area.

This is corroborated by the fact that after the Muslims fled from Sanjaynagar and Indira Gharibnagar on April 23 early morning, their pucca and semi-pucca tenements were burnt and systematically demolished with active police help. In all around 560 houses were destroyed and some 1,118 families rendered homeless. How could such a feat be accomplished without active police help? Urban growth, soaring land prices and increasing crime—these have forged deep links between the landsharks and black money operators, criminals and the ruling party. A rootless Chief Minister foisted from above by the Centre for its own political reasons has tried to establish his base among such elements. The alliance ensures both money as well as muscle power and coupled with some populist measures can ensure comfortable electoral majorities to the ruling clique. However, the people pay with their lives and property whenever the vested interests choose to extract their 'price'. The government and its machinery look on helplessly while the 'price' is extracted.

### RELIEF ON COMMUNAL LINES

Let us come back to the Bapunagar incidents. All the families rendered homeless sought refuge in the Aman Chowk Relief Camp. There were 6,000 inmates on the first day according to J J Sheikh and N A Saiyed, who are in charge of the camp. About 4,000 were still there when we visited the camp on June 23. It was a very ramshackle arrangement because of paucity of resources. The government was providing a pittance of Rs 5 per day per person, which was replaced by foodgrains a fortnight later. Solanki told us that so much was being given to the inmates of the camp that they had developed a 'vested interest' in staying there even though 250 houses had already been repaired. Our inquiries on the spot did not bear out these claims. The relief being provided is hopelessly inadequate and the victims were living in a mandap open on all four sides with hardly anything to sleep on. Not more than 150 houses had been repaired and each family had been paid Rs 2,000 compensation irrespective of the extent of loss suffered. Those who are paid compensation do not get relief anymore and are compelled to leave the camp.

The relief is being organised on communal lines with the Muslims making their own arrangements and the Hindus their own. This is another sad commentary on our secular culture. We have certainly opted for a secular polity but are far from building up a secular culture and secular outlook. No secular organisation came forward to help the victims of Bapunagar. Dhirubhai Patel, the Sarvodaya worker, told me that despite his repeated requests the Sarvodaya workers showed hardly any interest in the relief work in Bapunagar. Dhirubhai also pointed out that there were several big trusts owned by rich Hindus but none had come forward to do anything. Such apathy, bordering on hostility, on the part of majority community helps in accelerating the process of communalisation on the part of both communities.

The Nagrik Samiti, which was formed to put an end to violence in the city, too ended in a fiasco. Unfortunately it was headed by Justice Dewan who is a known supporter of the Vishwa Hindu Parishad. It failed to take any categorical stand on either the caste or the communal violence. It specially kept quiet on the communal incidents. The committee's behaviour is all the more surprising when we bear in mind that an eminent progressive writer and poet like Umashankar Joshi is on it.

Girish Patel and Mahesh Bhatt pointed out that even the bar and the judiciary have not been able to escape the deeper and sinister influences of communalism. The Bar Association of Ahmedabad of City Civil, Criminal and Small Causes Courts (having 1,500 members) in its meeting on June 20 passed a resolution condoling the deaths of Head Constable Laxam Desai, PSI Rana and the eight Dabgarhs who were burnt alive in a house by Muslims, but made no mention of the victims of the Bapunagar communal violence, nor of other Muslims killed in several other incidents. Justice Bhatt of the Gujarat High Court in a judgment delivered some eight months ago had written that the Harijans had exploited the caste Hindus for more than 35 years (by monopolising the reserved jobs). If such is the outlook of the judiciary and the legal practitioners what can be expected of ordinary people?

The other day of vicious communal violence was May 12 after the killing of PSI Rana by an unidentified killer (it is alleged he was killed by a Muslim; others allege that he was killed by an army man in a case of mistaken identity as there was no light at that time in the area). Rana was killed on May 8 and a fresh bout of communal violence started on May 9. This can be considered the third phase of communal violence. According to newspaper reports, seven persons were killed on May 9 and 18 persons on May 12. The police fired more than 200 rounds and it was difficult to keep count of cases of arson, loot and stabbing on May 12. Kalupur, Daryapur, Saraspur, Gomtipur and Bapunagar were the worst affected areas. The incidents were mainly communal in nature.

Bapunagar witnessed another bout of violence. Muslims had already fled from different parts of Bapunagar and sought refuge in the Aman Chowk Relief Camp. But some houses in 16 Blocks and 12 Blocks had not been attacked on April 23. Constructed by the Housing Board, these were pucca houses. About 100 of them were destroyed on May 12. Everything inside was looted and carried away. Another badly affected place was Jalampuri-ni- Chawl inhabited by Mansoori Muslims (i e, carders). The whole row of houses comprising some 220 units was razed. The Muslims fled in terror. All their belongings were looted. Opposite this chawl there are Patel houses. Not a single house has been touched. When we went round Jalampuri-ni-Chawl on June 23 not a single person had returned. The chawl wore a deserted look. These too were pucca houses and it must have taken a large number of persons with appropriate tools to demolish them so systematically. One cannot but wonder at the planning and systematic execution of the operation during curfew. In this new phase the communal orgy continued for a number of days. It has become difficult to keep count of the dead and injured. What appears in the press is only a part of the truth.

### ROLE OF THE PRESS

The role of the press has not been such as to distinguish it. The language press in particular is completely prejudiced against the Dalits and the minorities. When some atrocities were committed by the police on high caste Hindus the press went hysterical in its attack on the police and the government. Page after page carried the highly exaggerated accounts of these atrocities. Even doctored photographs and false stories were published.

When the Dalits and minorities were attacked by the police, the press in Ahmedabad not only kept quiet but tried to suppress or play down many of the events. The Bapunagar, Jalampuri-ni-Chawl and Ambedkarnagar incidents were played down. In Ambedkarnagar on April 22 more than 200 Dalit houses were razed and burnt and three persons were killed. Many Dalits fled in terror. The lathi charges on upper caste Hindus were nothing when compared to the Bapunagar and Ambedkarnagar incidents. Yet the champions of press freedom did not react. After the murder of PSI Rana on May 8 the role of the police began to be glorified by the press. As far as the attitude of the press towards the police is concerned, Rana's murder was something of a watershed.

The press did not hesitate to carry stories without checking if Muslims or Dalits were actually involved. Even a paper like *Times of India* in its issue of May 13 (Bombay edition) carried a completely false story about Muslims carrying arms disguised as a dead body. The report said, "An armed mob of 100 was moving under the disguise of a funeral procession. It was stopped at Gomtipur by the police. Lethal weapons were concealed in a bedstead being passed off as 'body'. The weapons including pipes, knives, dharias and acid bulbs."

The whole story is a concoction. I met Salmabi whose five-month old son's body was being carried in the funeral procession. I met her at the relief camp in Aman Chowk. Salmabi told me that her son had died on May 12. Her husband and twelve others had carried the dead body wrapped in cloth and buried it in the cemetary and were returning on cycles when the police stopped them and began hitting them with lathis. Then a mob attacked them and killed two persons including Fakhruddin, Salmabi's husband and father of the child just buried. All this happened in the presence of two Congress(I) Corporators, Shamser Singh Rajput and Gyanchand Jain. They did not stop the police or the mob from attacking and killing the Muslims. The press, without verifying, published the version dished out to it by interested parties.

The Gujarati press played a most mischievous role. It gave the names if those killed were Hindus and refrained from doing so when those killed happened to be Muslims. *Jansatta* published all the names of the Dabgarh Hindus (eight of them) who were burnt alive on June 9. The government confiscated copies of this issue of the paper. When the copies were confiscated it raised the issue of the freedom of the press. The way news management has been practised by the papers, a common man in Gujarat would think that most of those killed in the disturbances were Hindus whereas the truth is quite the opposite. Three rickshaw-walas (all Muslims) were burnt alive in Narayanpura alone (a posh suburb mostly inhabitated by Kadva Patels). The mob would ask for the licence which mentions the name and on finding a Muslim name would set him and his rickshaw on fire. However, in the interest of 'communal harmony' the press would not mention the names of these victims.

### THE FOURTH PHASE

The fourth phase began with the Gujarat Bandh for five days in the first week of June. Ahmedabad was rocked by communal violence once again. Many major incidents took place and are still taking place at the time of this writing. Seventeen persons were killed on June 9, of which eight were burnt alive in Dabgarhwad in Daryapur locality. These Dabgarhs were Hindus belonging to a Backward Caste included in the list of Backward Castes by the Bakhshi Panch. Most of the Dabgarhs had fled the locality a few days before this incident. Only this family of eight had remained.

On June 9 some miscreants had set fire to a house belonging to Mansoori Muslims near the Dabgarh house. There were three families inside the Muslim house. Hearing their cries some Muslims gathered and rescued the families with the help of ropes. The enraged mob of Muslims then set fire to the Dabgarh house. A number of incidents had taken place in the Daryapur area. Over the previous month 20 cases of stabbing of Muslims had taken place, but the police had not taken any action and no one had been arrested. Incidents of bomb blasts were taking place almost every day but the police was completely ignoring all this. There was accumulated anger and the innocent Dabgarhs who had stayed back paid with their lives. Some Muslim women tried to prevent the fire brigade from entering the area to rescue the Dabgarhs. The fire brigade officer fired from his revolver killing two Muslim women. The army then surrounded the area.

Another major incident was that of the Rathyatra. The temple priest had earlier agreed not to take out the procession in view of the grave situation in the city. However, Shambhu Maharaj of Jai Ramrajya Paksha and others insisted on taking out the procession even by defying the ban. The Rathyatra was taken out on June 20. The organisers insisted upon entering the walled city and the procession passed through the Muslim areas. A section of the processionists were shouting *bandyas qabrastan jao ya Pakistan jao'* (circumcised Muslims go to Pakistan or to the graveyard). Slogans were being shouted against the Harijans as well. A person was seen throwing a bomb at the Muslim crowd and was arrested by the army. It was then that the Muslims threw stones at the processionists and the army opened fire, killing seven Muslims. While many Muslims had greeted the procession with 'arti', some miscreants were bent upon creating trouble.

Women now are being attacked and stabbed. On June 23 came news of two Muslim women having been attacked. One women of 22 had been stabbed on Relief Road near Zaveriwad and succumbed to her injuries. Another 70-year old lady was attacked with acid which affected her eyesight. What is worse, even women have begun to take part in the attacks. Dehumanisation has reached its limits.

The agitation against reservations has completely degenerated into communal violence. Communal incidents have taken place in Viramgam, Baroda, Savarkundla and several other places. In Viramgam Bohra shops were burnt and looted causing a loss of a crore of rupees. Now the only logic of the communal incidents seems to be to topple the Solanki government. To bring this about innocent Muslims are being made to suffer.

### DEEP CONSERVATISM OF UPPER CASTES

The caste and communal violence in Gujarat in which over 200 lives have been lost and more than 1,000 injured has conclusively shown how deeply conservative the Gujarati upper castes still are. Industrialisation (Gujarat is second only to Maharashtra in this respect) and affluence have failed to inculcate a modern outlook among the upper classes. Their hatred of minorities and the lower castes runs deep.

There seems to be no direct relationship between industrialisation and modernisation in the Third World countries. There are various mediating factors which need to be thoroughly studied. Those who talk of computerisation and use of ultra-modern technology seem to be totally ignorant of the forces of soical conservatism so deeply ingrained at all levels of our social existence.

Extreme poverty and misery among the minorities and the lower castes and tribes on one hand and affluence among rich upper caste Hindus on the other create unbearable tensions which are easily transformed into violent outbursts as in Gujarat. Without restructuring the soico-economic system and greater flow of resources in favour of the weaker sections these tensions cannot be eased. Reservations for jobs and in educational institutions and other economic concessions to the lower castes and the minorities are some of the ways of bringing about such redistribution of resources. The middle classes clamouring for a greater share of resources act as carriers of caste and communal viruses through their pen and power of speech. The role of the press in Gujarat has shown this once again.

## VKRV Rao Awards in Social Sciences

THE VKRV Rao Award in Public Administration for 1982 has been given to Kuldeep Mathur, Indian Institute of Public Administration, New Delhi. The Award in Demography for the year 1981 has been given to Pravin Visaria, Director, Gujarat Institute of Area Planning, Ahmedabad, and for the year 1984 to J Krishnamurti, Delhi School of Economics, Delhi.

The VKRV Rao Prizes in Social Sciences, instituted by the Institute of Social and Economic Change in 1978, carry a cash award of Rs 5,000 and are administered by the Indian Council of Social Science Research. The Prizes are given to Indian scholars below the age of 45 years for significant original contribution to human knowledge and progress, applied or fundamental, in specified fields of social sciences.

# 1985 Textile Policy

## End of Handloom Industry

L C Jain

THE 1985 textile policy has thrust upon Rajiv Gandhi the dubious distinction of becoming the first Prime Minister of independent India to preside over the liquidation of the handloom industry which has been intimately woven into the history of India's freedom struggle and her crusade against underemployment in the post-independence period.

Protection for handlooms against unequal competition from mills and powerlooms has hitherto been the cornerstone of our textile policy. This has been knocked out and with it any possibility of saving the handloom industry, with all its significance for rural employment, from total destruction within the next five years at the most. The textile policy expects handlooms to depend on their own muscle power to chase away the killers. In the objective situation, it is as foolish and fatal as asking the Prime Minister to rely on his own valour against armed marauders without the aid of the protective force. Inner strength is a necessary but not a sufficient condition, given unequal resources and influence.

In contrast, the policy feels that its favourites—the mills and powerlooms—cannot move an inch without generous aid and protection. Not only all capacity restrictions have been withdrawn on mills and powerlooms but all conceivable financial, fiscal and other assistance has been offered to enable them to occupy the market rapidly, leaving little space for the handlooms except for some controlled crumbs.

Although 'consumer preference' and 'cheaper' cloth are cited as the guiding principles for the new policy, the mills will be protected against imported cloth which will be more to the point if the true aim was to cater to consumer preference and low price. In any case, the product reservation and the so-called 'package' of development assistance offered to handlooms are hollow, as will be shown, and a mere smokescreen for a basic anti-employment, anti-handloom and anti-khadi shift in policy.

### BACK SEAT FOR EMPLOYMENT

The most significant departure the new textile policy has made from the past is in its resolve to liberate the making of cloth from the burden of employment. This formulation destroys the very rationale for support to handlooms and khadi, though ironically the policy does not fail to sprinkle the text with praise for their employment contribution. Henceforth, employment is to be only "kept in view" but not allowed to thwart modern machines from clothing the nation (or upper India) adequately for the 21st century.

It has been argued, without adducing any facts, that multiplicity of objectives including the employment objective have inhibited the textile policy from producing cheap cloth for the masses and kept low the per capita availability and consumption of cloth. This diagnosis has obviously led the 1985 policy to the prescription that cloth output must expand even at the cost of substantial shrinking of employment. It has been assumed that enhanced availability of cloth is all that is required for its enhanced consumption.

In an economy where a galloping (estimated 27 million tonnes) bufferstock of foodgrains mocks at the incapacity of millions of malnourished men, women and children to come forward and eat it, even the blind can see that availability and price alone without purchasing power cannot improve cloth consumption. It is an elementary fact of our life that the half-clad are also half-fed and half-employed. In the circumstances, a policy which accords priority to expansion of cloth output to cover the naked and the semi-naked, which results in simultaneous and substantial reduction in the numbers employed, can only be called perverse. Its perversity is reinforced when it is realised that the hi-tech textile machines will not produce cheap cloth to cover the poor as claimed, but only super-fine cloth to over-clothe the rich. Maximising 'per capita consumption' is not the same thing as providing 'minimum cloth for each person'.

It may be recalled that the output of cloth by mills was frozen in the early 50s to protect employment of the handloom weavers thanks to the powerful advocacy of their case by Rajaji, the then Chief Minister of the erstwhie Madras State. This ban intended to maximise employment in the process of making cloth, was reinforced by the Mahalanobis development strategy adopted in the Second Plan. That strategy commandeered scarce capital resources to build basic industrial infrastructure and capability for India and relied on the traditional industries, using low capital and traditional skills and equipment, to supply wage goods (including cloth) as well as to meet the employment objectives of the Plan. In exchange, the traditional industries were offered protection and promotional support.

The textile mills, with political and administrative complicity, attempted to defeat the restriction on their output by installig *benami* powerlooms which have mushroomed since the 60s. A High-powered Committee for the Handloom Industry in 1974, headed by P Sivaraman, then a Member of the Planning Commission, was shocked at the magnitude of displacement of handloom weavers caused by the growth of authorised and unauthorised powerlooms. The committee found that for every two persons a powerloom employed, it displaced twenty-four persons in the handloom sector. Consistent with the employment objective of the national plan, the Committee called for a resolute ban on further expansion of powerlooms. This recommendation was eventually and firmly embodied in the 1981 Textile Policy statement laid before Parliament:

> Consistent with the objectives of providing adequate protection to the handloom sector, the growth of powerloom sector should be regulated and monitored . . . Fresh expansion of capacity [of powerlooms] would be so regulated that at the end of 1984-85 the increase over the base year in this sector is upto five per cent only. Moreover this [five per cent] expansion will be permitted in respect of handloom co-operative societies only.

In practice of course it was so well 'regulated' that the actual increase in number of powerlooms was not five but 150 per cent, if not more. Besides, the entire 150 per cent growth was in the private sector and some in a few so-called 'powerloom co-operatives'.

It is also pertinent to recall that within the textile sector the making of cloth by handlooms has been preferred hitherto because it yields relatively higher employment by numbers per unit of output and per unit of capital and uses lower capital per unit of output. Barely two years ago, in 1983, the policy of protection to handlooms initiated by the Mahalanobis strategy received a boost at the hands of government's 11-point New Technology Policy. The policy declared by late Prime Minister Indira Gandhi at the inaugural session of the Indian Science Congress on January 3, 1983 at Tirupati—the sacred abode of Lord Venketeswara—promised to "provide maximum employment to women and weaker sections", and undertook to:

> use traditional skills and capabilities making them commercially competitive;
>
> ensure the correct mix between mass production technologies and production by masses;
>
> ensure maximum development with minimum capital outlay.

### WORTHLESS 'PRODUCT RESERVATION'

The only protection for the handloom industry that survives the new textile policy is 'product reservation' which has been on paper as a farce for the last three decades. A Commerce Ministry study group on 'Reservation of Handlooms' had reported in September 1981 that it "found total apathy as far as enforcement is concerned". A recent study (May 1985) by Arti Kaul, a researcher, in Meerut district, revealed that not a single handloom or powerloom weaver was aware of the existence of the scheme of product reservation. And, to cap it all, she found that even the Project Director of the Handloom Intensive Development Project or the District Industries Centre had never heard of the government scheme of product reservation for handlooms.

True, Parliament has recently given product reservation for handlooms a law of its own (to be gazetted shortly). But it is a law that will be placed in the hands of those who have not only shown total apathy for its enforcement in the past three decades, but are hostile to the handlooms.

The policy has also repeated *ad nauseum* eight promotional steps to "preserve the unique role of handlooms and enable them to release their full potential". Even if all these steps are sincerely and solidly implemented—though anyone with the knowledge of the past would snigger at the suggestion—the handlooms would not acquire the power to withstand the onslaught of the mills and the powerlooms which have been provided liberal largesse to occupy all available space in the market for cloth. Assuming that the handlooms would indeed be a bit better dressed this time by the eight-fold development measures, they would have nowhere to sit insofar as the textile market is concerned.

The scope for even accidental survival of handlooms has been diminished by wholesale sickness transferred on their shoulders in the form of "responsibility for production of controlled cloth"—an activity which it is claimed made the healthy mills sick and the sick mills sicker. It is with tongue in cheek that the policy-makers have hailed the transfer of controlled cloth on the shoulders of the handloom sector as a favour conferred on the latter. In the same vein, it has been stated that all encouragement will be given to the expansion of khadi programme "in view of its large employment and income generating potential in rural areas, specially among women". With all the nails they have driven, the framers of the textile policy must take everyone to be a drone to be carried away by their rhetoric-laden preamble that the textile industry has a unique place in the economy "for its contribution to employment".

Incidentally, the package of development measures for handlooms includes a programme of 50,000 residence-cum-work sheds for the handloom weavers in the Seventh Plan. But the convoluted financing arrangement made for even these 50,000 residence-cum-work sheds is such that it would be a miracle if even 10 per cent of the target is actually achieved. What a hurdle race for the handloom weaver to extend his hovel by a few feet so that his children can co-exist with the loom.

What was wrong with the 1981 textile policy was not the policy but its deliberate violation by private profit-seekers and government's own political and administrative elite and enforcement machinery. Instead of removing the thorn, the 1985 textile policy has done away with the body itself. As noted earlier, the mills will no more have capacity restrictions; and new powerlooms need no authorisation. All that is required now for the powerlooms is to be 'compulsorily' registered after they have been installed—which is like compulsory registration of the birth of a baby, a biological *fait accompli*. In fact the policy goes on to promise that a suitable package of measures would be evolved in order to bring about a "healthy development of the powerloom sector". So far, handlooms were being killed by powerlooms gradually, behind the camouflage provided by the 'handloom-first' textile policy. Now the killing will be in the open, accelerated and will no longer be even an offence.

Consequently, at least a million persons—men and women—in the handloom industry can be predicted to be thrown out of employment in less than five years. Most of the displaced will be in remote rural areas which have no power and no alternative employment opportunities. Under this new policy, employment in even the mill sector will shrink significantly, as hi-tech automatic machines will be utilised to step up cloth output in the machine sector with 'soft-loans' to be liberally supplied by government.

### New Harvester Combine Policy

Handloom weavers, especially in rural areas, work part-time on handlooms and part-time as agricultural labour. To ensure the total destitution of the handlom weavers—as if they were enemies of the nation—the new textile policy was followed up by the decision to make harvester combines which were hitherto solidly banned. This ban on harvester combines was due to the danger of large-scale displacement of agricultural labour pointed out by several studies including the one conducted by the Agro-Economic Research Centre of the Delhi University on behalf of government. The study persuasively advised against the induction of harvester combines from the viewpoint of employment. Incidentally, the Agro-Economic Research Centre's study carried also the stamp of approval for its findings in the introductory remarks of Sukhamoy Chakravarty who till only a few weeks ago was Chairman of the Prime Minister's Economic Advisory Council. It is common knowledge that the big farmer lobby, specially from Punjab/Haryana, has been exerting pressure for import of harvester combines to get rid of the bother of coping with agricultural labour.

As a result, lakhs of idle agricultural workers from eastern UP and Bihar will no longer find work, wages and foodgrains they have been gathering each season from harvesting the bumper crops in Punjab and Haryana. The handloom weavers amongst these seasonal agricultural workers will thus lose one-half of their income to the textile policy and the other half to the harvester combine policy. A similar fate awaits the handloom weavers-cum-agricultural labourers in the other agriculturally surplus districts in Tamil Nadu, Andhra and elsewhere.

Thus not only in the textile sector but generaly, the government appears to have embarked on a perilous path of producing goods and services without bothering about employment. Though a hint of these coming changes had been in the air, little did one suspect that the new textile and harvester combine policies will not only strike but also wound.

If the government is convinced that fears of large scale displacement of handloom weavers are not true, let it guarantee that it will provide compensation and rehabilitation assistance to any handloom weaver dislodged due to the new textile policy—as it has proposed for the retrenched weavers in the organised sector. Let the fund proposed by the textile policy for compensating the retrenched textile workers in the mill sector be broadened to include also the handloom weavers.

The euphoria about the new textile policy is confined to the lobby of the mills and powerlooms and those who are fortunate not to have seen a village or faced underemployment or unemployment. They have hailed these as harbinger of 'hope' and a 'bold' departure from the past. It did require some boldness, if that is the virtue we are seeking, to have reversed the textile policy rooted not only in the freedom struggle and nurtured by Gandhiji and Rajaji, but also rooted in India's socio-economic realities as recognised by the successive Five-Year Plans in the past.

We must wait and see how the 1985 textile policy will fit into the Seventh Plan expected to be finalised shortly by the National development Council. What is known of the Seventh Plan strategy so far through the Approach Paper published last year is that it rests on three pillars: food, work and productivity. But, if sector by sector the government has already resolved to subordinate, if not sacrifice, the employment objective then it remains to be seen by what magic wand the Seventh Plan can sustain *food* and *work* for the masses, as its primary objectives. Insofar as the third pillar of the Seventh Plan

When corresponding with the Circulation Department, subscribers are requested to mention their subscription numbers.

Approach Paper, namely, *productivity* is concerned, it is to be noted that the new textile policy aims at achieving productivity only per machine and not per person employed in the endeavour of producing cloth for the country; nor does it aim at productivity of scarce resources such as capital and energy per unit of cloth output and per person employed.

The policy has strangled more than handlooms. We have no foreign cloth to burn but it will be a great national duty to oppose and burn the textile policy resolution publicly as an act of solidarity with the inarticulate poor and unorganised workers whose case was eloquently advocated by the Prime Minister at the ILO Convention in Geneva only a few days ago.

## WOMEN

# On the Road to Nairobi

**Rita Manchanda**

WITH the Nairobi Gonference to mark the close of the UN Decade for Women due this month, it was only to be expected that there would be a mushrooming of local review conferences to assess the achievements of the decade. Recently a single fortnight saw the Capital host four meetings on women which in their own distinctly heterogeneous way were conceived as somewhere along the road to Nairobi.

Most closely oriented towards the Nairobi Conference was the Conference of the Women's NGO Consultations convened to focus specifically on the "Women's Decade in Review". The meeting of the Chhatra Yuva Sanghursh Vahini was in its poster projected as appraising the achievement of the first Women's Decade but appeared instead to devote itself to the recitation of the narratives of the 23 women who had marched from Kotputli (Rajasthan) to Delhi. It did provide an occasion for grassroots activists to dialogue with middle class activists of the women's movement, exposing too their wide divide. The Nehru Memorial Library's Seminar on Education, Women and Socialisation was a much more academic exercise with Vibha Parthasarathy's presentation of the experiment in her school, Sardar Patel Vidyalaya, being the high point.

Finally, there was the mega conference of the Non-Aligned and Developing Countries on Women's Role in Development to co-ordinate the position of this body for the Nairobi Conference. Forty-nine countries participated in this ministerial conference which significantly lacked the fanfare that normally accompanies such conferences, itself a reflection of the low value attached by both in host and participant countries to the women's question. One has only to juxtapose the official handling of the Women's Conference with the NAM Co-ordinating Bureau's Namibia Meeting to expose the hierarchy of political importance.

Conferences of the non-aligned are well-known for the skill with which they are able to arrive at consensus declarations that paper over the differences between such polarised countries as Singapore and Cuba, but I must admit that there was considerable curiosity to see what kind of document on women would find approval with Khomeini's Iran, Zia's Pakistan, Castro's Cuba, Mengistu's Ethiopia and Gandhi's India. And the document is bold, indeed unambiguously political, in its challenge to the traditional view that women's problems must be seen in social, humanitarian and demographic terms. In rhetoric at least we have come a long way from Mexico, 1975. Women's role is seen as vital to the rate of development of a country. The twin myths of the supplementary nature of their work and their 'backward consciousness' which justified women's unequal political participation, are categorically rejected.

Through the conferences in Mexico, Baghdad, Copenhagen and now New Delhi it has become accepted that in developing countries women are the primary producers of food. "Men predominate in the decision-making and management of commercial or large-scale agriculture which has been modernised and women continue to predominate in the food and subsistence sector with low levels of technology and low returns." The report draws a link between the neglect in government policy and planning of women as primary food producers with the growing food crisis in sub-Saharan Africa. In this region females constitute 46 per cent of the agricultural labour force and in Asia 45 per cent. The 'invisibility' of many types of subsistence production and the use of industrialised countries' definition of 'work' have resulted in the undercounting of women's work.

Many of these issues have been recognised and recommendations made in several women's conferences. Yet in 1980 the UN reported at the Mid-Decade Conference in Copenhagen that "women while performing nearly two-thirds of the world's working hours still receive only one-tenth of the world's income and own less than one-tenth of the world's property".

Identifying the problems in implementing strategies to improve women's role in agricultural development, the report highlights the conceptual level, or lack of knowledge about women's role as producers. There is the lack of investment in sex-based data. Besides, most of the research on rural women's participation in development during the decade have been internationally funded and often not known to national governments.

At the root of the problem remains the low status of the 'invisible' women. Despite the abstract acceptance of equality, those laws which pertain to the ownership of rural assets have not been operationally restructured. Moreover, the commercialisation of agricultural land and privatisation of communal lands (forests) and the importance attached to households as the basic ownership unit for programme benefits, have tended to defeat policies which aim to recognise women as equal owners or independent beneficiaries. On the whole, there has been insufficient recognition of the need to address gender-based hierarchies and power relations within families, communities and societies at large.

The report also addresses itself to the problem of the 'specificity' *versus* the 'integrationist' approach. In some developing countries women's specific projects are aimed at providing income-generating activities and basic needs to rural and urban women. These projects address themselves to the immediate need of survival faced by women in the poorer strata but, in the long run, end up marginalising women further, instead of achieving the full integration of women in the development effort as a vital contributor. Consequently, at the close of the Women's Decade, the crucial deliberations on food strategies, industrialisation, rural development, monetary reforms, science and technology still face problems in integrating the women's dimension within their overall plan of action, although after Copenhagen 'integration of women in development' has become an accepted rhetorical principle.

Linked with the specificity debate is the setting up of Departments for Women's Affairs. During the decade many governments have set up Commissions or Ministries for Women's Affairs. India this year created a Ministry of Social and Women's Welfare which has given rise to much optimism among a section of women's groups here. And it is appropriate to take note of the reservations expressed in the report on these administrative structures. The Mid-Decade Review in its assessment of the efficacy of these institutions said that the "tendency to locate such units mainly within departments of social welfare and culture which are considered non-productive and are not usually in the mainstream of the development effort" is a serious drawback if not distortion of the perception of the vital role of women in the developmental process. They also suffer most from budgetary constraints during the economic recession. Moreover, the existence of state mechanisms of this kind tends to reduce the concern of other administrative organs and of society as a whole for the advancement of women.

Women have to be 'visible', if their access to health, education and economic development is to be assured. Political participation through the electoral process is the first step. The report states that at the end of the Second World War only 31 countries had conceded women's suffrage. By 1979 women in 129 countries had won equal rights, and seven countries granted this right to women constitutionally during the decade. Yet participating in this very Women's Conference were countries where women did not yet have the right to vote. Interestingly, the draft document prepared by the host country, India, had included in this section another sentence, "There are six developing countries . . . which exclude women from the formal political process open to men. All of them are located in the Persian Gulf." It was one thing for the Oman delegation to agree in the abstract to the need for political participation but this sentence cut too close to the bone. The report instead seeks to skirt its assessment of women's political participation in these countries by saying that "it varies with the nature of the political system". It draws a further distinction between those countries which had popular liberation movements that had mobilised women and developed women's wings in their organised political parties. In Algeria and Iran women were in the forefront of their revolutions. Yet in post-revolution Iran women have now become completely 'invisible'. Iranian delegates participated but obviously such awkward questions were glossed over.

The report indicates that in countries where the women's issue is being actively debated, two trends have emerged during the decade—an active women's wing in political parties and trade unions, and separate but politically-oriented women's organisations. Accommodation of the women's demand for participation has found easier acceptance in political parties than trade unions. Assessing the situation at the end of the decade the report claims that while the visibility of women in the political and developmental process has increased because of greater efforts to obtain first-hand knowledge, the search has also identified powerful and hidden forces. At the centre of the debate is the myth of women's 'backward consciousness' as evinced in her lower participation. Studies have, however, shown that in the fight against colonialism and the struggle of workers, women have responded with equal vigour. There is, moreover, the fact that mobilising organisations, political parties and trade unions neglect to communicate with women. Also the additional responsibilities on a woman—of childcare and household chores—make it difficult for her to participate. Trade unions, in particular, resist sharing of responsibility with women. Indeed, the greatest resistance to equalisation of wages between men and women come from trade unions. Lack of data on women's participation has reinfored this tendency to regard politics as not a woman's domain. "This kind of perceptual invisibility has helped to strengthen the unwritten law that regards politics as not a woman's domain in the same manner that non-acknowledgement of women's contributions to the economic progress has affected their rights and positions as workers and producers."

The report also focuses on the mushrooming of independent political organisations by women such as that of poor, self-employed women who are excluded from trade union membership. The difference in the pace of growth of women's informal political activity and the sluggish pace of their accommodation in formal political activity has given rise to a questioning by activists of the concept and indicators of political participation.

The New Delhi document is to serve as the basis of the non-aligned stand at Nairobi, though Begum Zari Sarfraz, leader of the Pakistani delegation, felt that the fragile consensus achieved in Delhi would probably not be able to withstand the East-West pressures that threatened to split the global conference in Nairobi. The preparatory conference in Vienna last March spent most of its time on the question of imperialism, and women's issues took a back seat. Indian participants, however, feel that had the New Delhi meet taken place before Vienna the New Delhi document could have played the same progressive role as the 1979 Baghdad Non-Aligned Women's Conference did for Copenhagen. They are still hopeful about influencing the preparatory UN draft which is yet to be finalised.

While the New Delhi document could be a powerful weapon to radicalise the Nairobi meet, closer to home what impact does the progressive rhetoric have? One can be excused for being cynical when Begum Sarfraz, as Pakistan's representative, has approved the document and yet adds: "Women have got more benefits under the military regime of General Zia than under the parliamentary system under Bhutto."

Vina Mazumdar, Director for the Centre of Women's Development Studies, was much more positive about the educative impact of the rhetoric of such a conference on advancing the role of women. She recalled that in 1980, NGOs were able to pressurise the government on the basis of their declaratory stand on women's issues in international fora, to include a section on women in the Sixth Plan.

India was one of the very few countries that had included NGOs as part of their official delegation. Curiously Begum Sarfraz could not see any reason why anyone from Pakistan's Women Action Forum or other NGOs should have been invited to a ministerial conference. Indeed, the guidelines for the conference formulated in 1976 specifically spoke about the participation of NGOs. The document also stresses the need to involve NGOs and the media. Yet here the Government of India drew the line. There were no media representatives included in the delegation and the press was debarred from attending anything other than the inaugural session.

The Planning Partnership

**Participants' Views of Urban Renewal**

"(This book) should be read by those who are interested in citizen participation in the planning process." (*APA Journal*)

Members of a project planning team of scholars, administrators, planners, and community leaders offer differing perspectives on this ambitious attempt to create a liveable environment for poor, primarily black, slum residents. The result is a unique, multifaceted history of an urban renewal project. This volume will interest urban officials, planners, and scholars.

## EUROPE

# Bonn-Paris Ties Strained

### Ramesh Jaura

NEARLY a year before Helmut Kohl was sworn in as Chancellor of the Federal Republic of Germany on October 1, 1982, the then opposition leader was presented the book entitled "The Giant in Fetters", co-edited by this correspondent with colleagues from Austria, USA and USSR. Several contributions in the book highlighted the economic and industrial power of FRG and pinpointed the limitations placed on its room for manoeuvre in East-Wast relations in particular and world affairs in general.

"The Giant in Fetters!" quipped Kohl, adding: "Hopefully, the next book will be titled the Black Giant!' The tall, heavyweight Kohl was referring to an attribute given to him by a West German publicist in an attempt to sell the conservative CDU leader as someone who was blessed with much greater farsightedness and historical mission than petty newspaper scribes could ever imagine.

Over two-and-a-half years after Chancellor Kohl assumed the reins of power, the Black Giant's strategy seems to have crystallised at last. Its thrust is to help the Federal Republic of Germany shed as many post-war psychological fetters as possible even while risking apprehensions and misunderstandings, both among supporters and detractors, among partners and allies at home and abroad, near and distant. The Bitburg debate was one example. The obvious irritations in relations with France are another.

In fact the problems with France are of fundamental importance in view of West Germany's future role in European and international affairs. And this for the simple reason that, since President de Gaulle and Chancellor Konrad Adenauer signed the Elysee Treaty in 1963, Bonn-Paris ties have come to form the backbone of European reconciliation and collaboration. This, in turn, has come to be considered as crucial both to the Alliance between Western Europe and the United States as well as to the process of European integration spurred by the establishment of the European Community.

Since relations between any two countries or among a group of countries are not something abstract, personal ties between leaders have a decisive influence. De Gaulle and Adenauer sprang the Elysee Treaty on a German public opinion then nervous of the repercussions for relations with the US and the German Democratic Republic. Likewise, former President Giscard D'Estaing and Chancellor Helmut Schmidt hatched in 1979 the European Monetary System (EMS) which was then sprung on other EEC states.

If EMS is an example of monetary co-operation in Western Europe, initiated by France and the Federal Republic of Germany, the Ariane rocket programme, Tornado, Airbus and the European Space Agency (ESA) testify to Franco-German tie-ups in high technology with military implications.

The importance of personal contacts in relations between Paris and Bonn has been recognised from the very outset by President Francois Mitterrand and Chancellor Helmut Kohl as well. The two leaders have in fact revived the security clauses of the Elysee Treaty so that bilateral consultation between France and the Federal Republic of Germany over foreign affairs and military issues was intensified and made more systematic than the contacts between any other two governments in Western Europe. And this despite the fact that the Federal Republic of Germany is ruled by a coalition government dominated by conservatives and France has a socialist government.

The high watermark in France-Federal Republic of Germany relations based on reconciliation and co-operation was reached when President Mitterrand and Chancellor Kohl symbolically joined hands in September of last year in a moving ceremony of remembrance of the First World War battle of Verdun. This was a gesture intended to bury past conflicts and cement future relations. A new era in Paris-Bonn ties appeared to have been ushered in.

But, in practice, things took a different turn especially as it became clear that Chancellor Kohl was not satisfied with Verdun alone; he wanted reconciliation at the war cemetery where Waffen SS soldiers were buried. Under-the-surface friction was demonstrated quite dramatically by an article in the French daily *Le Monde* in March this year. The translated version, distributed by the French Embassy in Bonn, asked whether the Germans were pulling out of the European Community and charged West Germany of "cheerfully" resorting to "double-speak".

Hardly two months passed when, at the Western Economic Summit in Bonn in early May, Franco-West German ties appeared to experience a fresh jolt. President Mitterand and Chancellor Kohl found themselves at loggerheads both on the issue of a date being set for resuming global trade negotiations within the framework of GATT and on US President Ronald Reagan's Strategic Defence Initiative, popularly known as the Star Wars plan. Observers spoke of the Paris-Bonn honeymoon being over. Rarely had Franco-West German ties been so much to the fore in the German Federal Parliament Bundestag as they were in mid-May.

In an attempt to repair the damage caused by what was officially described as a "misunderstanding" at the seven-nation Western Economic Summit in Bonn, Chancellor Kohl and President Mitterrand decided to hold a private meeting in the Federal Republic of Germany on May 28. The five-hour meeting took place in the southern town of Constance, on the shores of Lake Constance.

How far the basic strains have been set aside will be better known in the coming weeks. But an indication of the state of Bonn-Paris ties was provided by a French newspaper declaring that De Gaulle and Adenauer had died a second death. West German officials have been at pains to play down persisting differences, especially on the SDI. But the fact is that President Mitterrand acknowledged to newsmen that the divergences between the two countries remained. France, he said, stood by its refusal to become involved in President Reagan's SDI.

Chancellor Kohl's pursuit of a 'patriotic' strategy has also unleashed a national debate on FRG's role in European and world affairs. The significance of the national debate is evidenced by the fact that former Chancellor Schmidt has broken the nearly three-year long silence and expressed deep concern at the state of Franco-German ties.

The social democratic SPD leader, Willy Brandt, also a former Chancellor, has initiated a joint action with the French Socialist Party to keep the damage to the minimum. Even liberal party leader Hans Dietrich Genscher, Chancellor Kohl's deputy and foreign minister, has been at pains to reiterate the identity of interests in security policy between Bonn and Paris.

Undoubtedly, Chancellor Kohl has tried specifically to allay fears about West Germany wavering on European political development by underlining the vital need for Europe to move ahead jointly in the high technology field, to cope with the challenges from Japan and USA. But apparently he has been finding it difficult to come up with a definite decision on Bonn's participation in Eureka, in some respects the French response to SDI.

The science and technology ministers of France and West Germany were to meet in June and eventually set up a commission of French and German experts to carry deliberations on joint work further. On SDI, where Bonn's stance has oscillated erratically, Chancellor Kohl told President Mitterrand that official participation by Bonn hinged on the resolution of a "whole range of unanswered questions". Whatever the conclusions of a West German delegation's fact-finding mission to the US, Bonn would then consult with France. Nevertheless, the debate has persisted.

**Hindustan Lever Limited**

# BIOTECHNOLOGY AND AGRICULTURE

## *Abstract* of speech delivered by Dr. A.S. Ganguly, Chairman, Hindustan Lever Limited, at the Annual General Meeting held in Bombay on Tuesday, 18th June, 1985.

Among the economic priorities of the country is determining the choice of future technologies. Development is no longer leisurely and chronological. The first industrial revolution was fuelled by coal and steam power and the second by chemical and electrical industries. Now change is being catalysed by the microprocessor on the one hand and genetic engineering on the other. These are the frontier areas of development which will usher in the next century.

The choice is not between the two, but on what priorities should be given to each one of them so that the country would be optimally served. The 'Green Revolution' was the beginning of agri-biotechnology application in its early days in India. The spread of satellite communications, weather forecasting and the extension of the television network over the last three or four years is an indication of the magnitude of manageable change.

India, compared to many nations of the South, is better equipped to undertake work in these areas which require a science and engineering base. While much is being written and discussed about electronics and telecommunications, the scope and potential of biotechnology in improving agricultural productivity needs to be brought into focus as well. Rapid advances have already taken place in Western Europe and the U.S.A. in this field. However, we know that exclusive dependence on imported technology has its own drawbacks since a certain level of national technology competence is necessary for more economical and acceptable global interaction.

As far as agricultural productivity improvements are concerned, the commendable advances which started in the sixties must continue. These include increase in fertilizer production and the use of new dwarf varieties of seeds, increased irrigation and cropping intensity, and specific inputs for dryland and marginal land farming. The quality of agricultural research in universities, and the transfer of information from laboratory to land have made phenomenal progress and must be further intensified. This has been matched by the response of farmers in adopting new methods and technologies. Several chemicals which have greatly enhanced field productivity are likely to improve in safety, versatility and effectiveness in the coming years. There are also areas of concern. The production of pulses and oilseeds has remained static; so has milk and fish output. Some of these represent critical deficiencies in the national dietary.

## NEW FRONTIERS

For today's address, I have chosen a few areas of the application of science to agriculture. The topic is of interest to the Company and is also a national priority. These frontier areas of science are likely to supplement the stupendous national effort being made to increase agricultural output. It is necessary to reiterate the term 'supplement', because the bedrock of the agricultural economy has been well established by a series of technological and economic measures; we will have to continue to improve their effectiveness and extend them. As satellite communications are unlikely to replace surface mail in India, it would be unwise to expect that the application of 'new biology' will overtake traditional and well-tested methods in agriculture.

There are certain lessons to be learnt here from the West. With the discovery and production of Interferon over ten years ago and subsequent discoveries in genetic engineering and monoclonal technology, there grew a belief that traditional techniques of treating human disease would undergo a radical change. In spite of these explosive developments, progress has been less enchanting in business terms. There is, however, no doubt whatsoever that many of these dreams are likely to be realised before the turn of the century. In the meantime, traditional organic chemical drug therapy continues to make spectacular advances. In the final analysis it will be an interweaving of the traditional with genetic engineering techniques which will emerge in the battle against major diseases. Similarly in agriculture it will be a combination of the well-tested with new scientific inputs which will usher in the next era of progress.

Hindustan Lever's history of the application of science and technology in its business is well-documented. Following the successful use of chemistry and technology to further traditional areas of business, new vistas are now being explored as part of our agri-business strategy. In this area, the achievements of Unilever research are very impressive indeed. It is this combination of a local science base and access to global developments which places the Company in a unique position for venturing into this area.

Biotechnology research has been in progress in a few laboratories in the country and more is planned, including a very ambitious national programme in collaboration with international agencies. But in order to be in the forefront of the fast developments that are taking place, greater coordination is necessary. I believe that industries dealing in agricultural products have a unique role to play both in the contribution they can make, and for the enormous opportunity they can provide in the longer term.

We recognise that an unassailable and strong agricultural economy is going to be a major factor in ushering in a more prosperous and confident future. Neither industry nor agriculture can thrive in isolation in this scheme of things. Nor will the developments envisaged follow the patterns long established in the well-endowed, sparsely populated and prosperous parts of the world. As in many other areas, development will have to match local conditions. In Hindustan Lever, we believe that there is now a growing interface between the agro-industry and agriculture which provides exciting opportunities for growth.

In the rest of this paper, I have dealt with broad issues associated with accelerating the application of frontier areas of science and technology research to agriculture and have cited specific areas of research and application which are important for successful agri-business development and growth in the Indian context.

## PRESENT POSITION

Improvements in agricultural productivity, particularly during this century have been science-led. Nowhere have the developments been as spectacular as in the U.S.A. The establishment and contribution of the Land Grant Colleges in that country was a consequence of the science pull in agricultural development. Af-

LINTAS HLL CORP 57 2418 A

# BIOTECHNOLOGY AND AGRICULTURE

ter World War II, these developments rapidly spread to Western Europe and certain other parts of the world. Advances took place in crop agriculture as well as in animal husbandry and pisciculture. This has created enormous surpluses of agriproducts, milk, fish, animal protein and edible fats.

In India, change began after Independence, first through import substitution, and then through the 'Green Revolution.' Education in agriculture, extension programmes, block development, increasing use of dwarf hybrids, fertilizers, pesticides and herbicides, and progressive coverage through irrigation all helped in these efforts. In spite of all this, agro-productivity is still predominantly monsoon-dependent.

As a result of intensive scientific research undertaken in the sixties, the industrial use of non-conventional oils such as ricebran, castor, kusum, mowrah, sal, neem and karanja increased and released the pressure on edible oils to some extent. However, per capita availability of indigenous edible oils has steadily decreased in spite of several steps taken, and imports have continued to increase. In 1984, a seminar was held in Delhi under the auspices of the Hindustan Lever Research Foundation (HLRF) at which eminent agricultural scientists from all over the country discussed the steps required to overcome this major problem.

An earlier HLRF seminar in 1982 discussed the problems of pulse production in India, which has been more or less stagnant for the last decade, thus reducing the per capita availability of protein to our largely vegetarian population.

The production of paddy, wheat and sugar has increased spectacularly through the application of scientific agriculture, and the progressive increase in the use of fertilizers, pesticides and herbicides. These have been supplemented by increasing investment in irrigation, storage and distribution facilities. But there are signs of levelling off and decrease in the value of incremental output compared to input costs.

Milk availability has increased modestly through cooperative dairies and government milk schemes in larger towns and cities. The introduction of crossbred cows has had limited success and the buffalo continues to be the main milch animal.

As for availability of animal protein, goat and lamb meat has been supplemented by increase in poultry farming. But per capita fish availability is steadily decreasing every year, which in turn is reflected in prices increasing much ahead of the general level of inflation.

Thus, in spite of many noteworthy achievements, there are several areas of concern as well. I believe that further strengthening of proven technologies and interweaving these with selective application of biotechnology will be the catalyst to improve agricultural productivity in India.

## BIOTECHNOLOGY IN AGRICULTURE — A PRIORITY ACTIVITY

I mentioned earlier that there is a lot to be learnt from the experience of new biology in Western Europe and the U.S.A. During the last twenty years, there has been a veritable explosion of discoveries comparable only to what happened in particle physics and wave mechanics earlier in the century. The development of the atomic bomb was rapid, but peaceful applications of the new physics came much slower. Witness the controversy about nuclear power plants all over the world. Similarly, the commercial exploitation of the new biology has been slow. The noteworthy exception is the development of human insulin by the genetic manipulation of bacteria. As with all major discoveries, we are passing through a phase of greater hopes than results. While it is necessary to take a cautious view of the speed with which the new biology will yield results, there can be no debate that our country has to plunge into it as an act of faith. We cannot afford to miss this unique opportunity to develop competence in a vital field which will soon be a major factor in geo-economics. It is also important to realise that as in any other scientific endeavour, global cooperation will be imperative. In order to participate in these developments of the twenty-first century, we have to prepare ourselves as partners rather than as supplicants.

As a result of the already high level of agricultural productivity and surpluses in the western world, biological and genetic research will continue to be predominantly devoted to human health in preference to agriculture. Furthermore, scientific applications in agriculture are not readily transferable unless there are suitable receiving agencies. Differences in agro-climatic conditions and plant types are also important factors.

With our limited resources, the choice of frontier areas of science for application, particularly to agriculture, must be selective. However, even within a limited scope, the costs and risks are going to be enormous and an exceptional order of skills required, so it is necessary to approach the issue as one having economic pre-eminence in the country's list of priorities. It would be my plea that all scientific and technological activities which lead to increased agricultural productivity should be considered to be of Core Economic Priority, not unlike many other areas where progress came only after such priority was given. In India, we have a well-established system of signalling economic priorities in the form of policy declarations and notifications. This has happened because major activities are state-funded, and especially as the scope of work and its costs would be beyond most university laboratories and many private industries.

Currently, the only activities meant exclusively for agricultural output and recognised as core industries of economic priority are inorganic fertilizers, pesticides and herbicides. They happen to be included in their own right as inorganic chemicals and heavy organic chemicals. The list now needs to be extended to include hitherto unconsidered activities related to agro-productivity which require modern techniques of biology, genetics and biotechnology.

## AREAS OF RESEARCH

Biotechnology is sometimes erroneously thought to refer to genetic engineering. While genetic engineering is the specific technique of transferring gene expression through laboratory intervention, biotechnology involves converting discoveries in new biology into industrial and agricultural applications. These include a whole series of disciplines such as biofuels, nitrogen fixation, fermentation, plant hydrocarbons, antibiotics, vaccines, microbial insecticides and biomass production. In India the National Biotechnology Board has chosen genetic engineering, photosynthesis, tissue culture, enzyme engineering, alcohol fermentation and immunotechnology as areas of immediate interest.

It is, however, important to realise that although the potential is unlimited, the scientific and technological infrastructure required to exploit this vast field is equally formidable. Fermentation and enzyme technology or bio-catalysis have possibly made the greatest advances in industrial terms. This is manifest more in Japan than anywhere else. As a matter of fact, Japan regards biotechnology as the 'last major technological revolution of this century'.

In India we already have a reasonable base to produce fermentation products such as antibiotics and organic acids, and in spite of the resource constraints in the country, the scope is indeed unlimited. For example, the use of enzyme technology to produce a number of high value fine chemicals and developing energy conservation processes has hardly been looked into. There is one particular area in which HLL scientists have achieved considerable success. Oils and fats are the major raw materials of our business. While new avenues for enhanc-

# BIOTECHNOLOGY AND AGRICULTURE

ing output continue to be explored, we investigated the question of using genetically modified bacteria to produce edible quality oil and glycerine for industrial use. Economically, such a proposition can only be of interest to a perennially oil-short country like India.

Although the developments are still at an early stage, the results are encouraging. Scientists in our laboratory have manipulated genes of two edible varieties of yeast to produce a hybrid cell capable of not only producing and accumulating high amounts of fats of the order of 50% of the biomass, but also capable of utilising sugar at high rates and producing fat within 3-4 days. This unique feat has been accomplished by a novel technique of protoplast fusion and gene technology. Our chemical technologists have succeeded in growing this newly engineered species of yeast in pilot fermenters and successfully extracting good quality edible fat from the biomass. Although the investments in industrial scale-up are rather high, our scientists estimate that we could one day produce good quality edible fats from molasses at a cost of Rs.9000 — 10,000 per tonne.

We are also engaged in the production of a number of other chemicals via this route, although progress, by its very pioneering nature, is slow and the high costs of scale-up make it imperative to evolve cost-effective engineering design. The work of selecting and modifying micro-organisms to produce a whole series of highly valuable chemicals economically will become one of the primary foci of biotechnology research and development programmes in this country. This is also true of the development of enzyme technology where a beginning has yet to be made. Our initial forays into this field appear promising but will have to await successful industrial scale-up.

## SOME PRACTICAL ASPECTS

To us in India, agriculture-related biotechnology is of exceptional importance. This encompasses key areas ranging from bio-insecticides, growth promoters/regulators and photosynthesis improvers to tissue culture, hybrid seeds production, genetic engineering and others including augmentation of edible fats and milk output and fish farming.

India owes its dramatic increase in cereals output to new hybrids such as the cross between Mexican dwarf and the Indian varieties. Indeed hybrid seeds today represent a big business opportunity in the country. The result of the union of two genotypes, hybrids are more efficient than their parents under a variety of agronomic conditions. Developed on systematic lines on a large scale, the spread effect and economic outcome will be quite significant. India is the first to produce hybrid cotton seeds by the novel 'hand pollination' method, evidence that the country has the capability to successfully forge ahead in this field.

Tissue culture is the tool in the propagation of true progenies of the parent plant with uniform growth and productivity characteristics for each species in a given agro-climatic environment through successive generations. The advantage of the technique in ensuring that commercial crops such as oil palm give the best possible yields is obvious. Unilever has achieved a breakthrough in the clonal propagation of oil palm. Begun 15 years ago, it is a successful commercial reality today. At Hindustan Lever's Laboratories , research is progressing with coconut palm. The tissue culture method, unlike the conventional methods of breeding, leads to obtaining increased genetic variability relatively rapidly. Fusion of cultured plant cells permits the development of unique hybrid plants. The technique could be valuable in achieving a breakthrough in the production of pulses and oilseeds.

Can the cells of cereal plants be genetically so altered that they use atmospheric nitrogen and thus become more productive? Can they be made to yield more with lower use of fertilizer? Can they thrive under conditions of moisture and salinity stress? Scientists are convinced that these will be achieved. Another area is the use of micro-organisms to aid the farmer harvest a better crop. Researchers know that the symbiotic nitrogen-fixing bacteria boost yields of pulses and certain oilseed crops. Attempts must now be made to enhance their nitrogen-fixing ability severalfold through genetic manipulation and also make them crop-and soil-specific. This is a highly sophisticated scienfitic field. HLL's scientists have carried out research work and field tests with encouraging results for pulses and oilseeds.

95 per cent of the weight of plants comes not from the soil but from atmospheric carbon dioxide and water. Apart from the genetics of plants, the major criterion determining the dry weight of the plant and the yield of the crops is photosynthesis. Scientists of Hindustan Lever have discovered a mixture of organic compounds which even in one ppm doses increases photosynthesis by 100 per cent or more. They believe that this route of enquiry is not only unravelling many new aspects of plant physiology but may yield other compounds which can be more readily transferred to farm practices.

Besides photosynthesis improvers, growth promoters/regulators are assuming considerable importance in the U.S.A. and Europe and even in South East Asia. Most of these mimic the natural substances present in plants such as hormones and oxins. Norms for manufacturing and using these unique chemicals are being constantly revised to ensure their overall safety. We must adopt the latest technology in this sphere, the cost of which would be insignificant compared to the benefits to be derived.

Another new field is bio-insecticides which are of bacterial, fungal or viral origin. These, and pheromones — insect sex hormones, many of which are synthesized — if adopted, will be of considerable benefit to India's agriculture. Our researchers have succeeded in synthesizing certain pheromones and these are being tested.

## CONCLUSION

The discoveries in new biology are spectacular. Like the micro-processor and the computer revolution, they hold out enormous promise. Countries around the world are busily engaged in preparing their base to move into the forefront of what has been described as the 'technology of the next century'. After the initial euphoria there is a sense of cautious optimism. The conversion of laboratory discovery into commercial success has turned out to be more tortuous than anticipated. Nevertheless progress has been made.

While we gear ourselves to catch up in computers and telecommunication, biotechnology is a new challenge at the starting line. We have the science base to undertake this exciting journey and our need is also great. While I believe that increasing traditional inputs will further improve our already spectacular achievements in agricultural production, the application of biotechnology will be the catalyst for the next leap. Shorter term gains are to be had in areas where progress has been lagging, e.g. oilseeds, pulses and fish farming.

In a resource-short country like India, biotechnology has a major contribution to make. This has been demonstrated successfully in Japan. Secondly, while much of global biotechnology will be engaged in tackling problems of human health and disease in the more affluent nations, agricultural productivity will be the prime concern of the developing countries. Even here, once a research base is set up, the fallout could be significant in areas other than agriculture. For example, some useful work has already been done in India on the application of immunobiology in the detection disease; future applications could be in treating diseases such as hepatitis, leprosy and malaria, and even for contraception.

The economic importance of research in new biology cannot be over-

## BIOTECHNOLOGY AND AGRICULTURE

stated; at the same time, there is the danger of understating the problems associated with it. The National Biotechnology Board has formulated certain schemes. Private industry has begun exploring opportunities. What is needed is a unified national approach interweaving the plans of the government and private industry into a tapestry of national goals. The tasks are too complex and the stakes too high to attempt any piece-meal approach. Only large goals and efforts are likely to produce results that bring real benefits as well as recognition in the international community in order to enable exchange of ideas and sharing of discoveries. This is how the great technology of the future is likely to evolve. We are ideally placed to ride the crest of this wave into the future. In recognition, this group of technologies must be accorded a place amongst the list of top economic priorities of the country.

Biological research and commercial application is a major strength of Unilever. In Hindustan Lever Limited, work on biochemical and agricultural research has been under way for several years. Some of the first discoveries are now entering the marketplace. Much more remains to be done. It is the combined strength of Unilever's global reach and HLL's scientific record which gives us the confidence to commit ourselves to the application of biotechnology to agriculture as a part of the Company's long term strategy.

### S K Sanyal

**Population of India**, Country Monograph Series No 10, Economic and Social Commission for Asia and the Pacific, United Nations, pp 414.

PREPARED by a galaxy of Indian demographers and other experts in close collaboration of the Indian Association for Study of Population and the Family Planning Foundation and with the financial support of the UNFPA, this voluminous monograph has been brought out by the ESCAP in the series of Country Monographs "to provide the countries with an understanding of existing population problems as well as with a scientific basis for decision-making, policy formulation and determination of development goals and targets".

Starting with a comprehensive overview of the geographical, historical, political, social and economic scenario, this monograph has covered a wide spectrum of aspects related to Indian population and its growth particularly during 1901-1981. As to the layout, the early inclusion of 'urbanisation' (as a separate chapter III) is somewhat indiscreet in what is otherwise a methodically sound exposition of the growth patterns, basic composition and trends in demographic behaviour of fertility, nuptiality and mortality in the first seven chapters. The topic 'Population Policy and Programmes' similarly should have been relegated to a later chapter, at least after the discusssion of 'Population Projections'. The repetitive stress on the defects of vital registration system and other sources of data through the different chapters could have been avoided by dealing with the subject in the Annexes suitably at the beginning of the volume.

Three major phases in the growth of India's population during 1901-1981 are discerned. A low average annual growth rate of 0.26 per cent characterised the first phase (1901-21) owing to very high death as well as birth rates. The second phase (1921-51) exhibited a steady growth rate of 1.2 per cent, succeeded by the third phase (1951-81) displaying an acceleration in the growth rate averaging about 2.2 per cent, the decline in both these phases in mortality being much faster than that in fertility. However, in respect of both the "sequence and tempo of change" in the Indian demographic situation, the universal validity of the theory of demographic transition is challenged by Pethe, though in a later chapter (p 255) it is accepted implicitly by Bhaskar Misra. Spatially, the growth of population has been uneven. During 1951-81, the northern, eastern and western zones registered higher growth rates than the national average. Premi's textbook approach of estimating for different states the net in-migration rates, it needs mentioning, could be misleading. The reversal of an in-migration rate of six per cent during the fifties in West Bengal to a net out-migration of 2.2 per cent during sixties needs explanation; the trend during the seventies should be examined. Not surprisingly, Ashish Bose feels disillusioned with model building (p 63).

## FERTILITY AND MORTALITY RATES

Meandering through a multiplicity of estimates, Saxena settles for a sex ratio (males per 100 females) of 105 to 108 for the country as a whole, the important factors responsible for excess of males are discerned as a male favoured sex ratio at birth and higher female mortality. The sex ratio is seen to increase over time, the increase in urban areas being more than in rural areas. The decline in child and infant mortality over the years, particularly after 1951, did however result in a slight increase in the proportion of the population below 15 in an otherwise static age structure. The population is no doubt getting 'young', the reduction in the median age being largely due to decline in mortality.

Trends in fertility, it is seen, could not be established convincingly for the period till 1970 because of the fragmentry and scattered evidence relating to different time periods and the difficulty in chosing one among a multiplicity of estimates relating to the same period. The Sample Registration Scheme (SRS), however, comes to the rescue in the seventies, when it could be established that, with the dent already made in fertility supposedly during 1961-71, there was a further decline in the late seventies. However, the myth of the reliability of SRS estimates of crude birth rate averaging around 34.52 during 1971-81 is exploded a little later in the volume by Natarajan (p 209) who with the simple addition of the growth rate of 22.3 and the relatively more reliable crude death rate of 14.8 finds the same to be 37.1. It would appear from the discussions that the methodology which yeilds the highest vital rate is adjudged to be the best and the tragedy of Indian Planning seems to be the incontrovertibility associated with these estimates of vital rates. To quote some results obtained on the basis of a survey in 1972, the high fertility belt comprises Uttar Pradesh, Haryana, Rajasthan, Gujarat and Madhya Pradesh. Among all religions, Muslim fertility remains the highest whether in rural or urban areas. Universality of marriage and early marriages are found to be two significant features of nuptiality in India. Legal measures appear to have had only marginal effects in increasing the age at marriage. In this light, the suggestion to fix the minimum age at still higher levels (25 years for males and 21 for females) reflects wishful thinking so far as the rural areas are concerned.

The mortality level in India is seen to be very high, particularly infant and maternal mortality. The belt consisting of UP, Bihar, Orissa and MP, together constituting 40 per cent of India's population, has very high rural death rates. Mortality among infants and children (1-4 years) constitute 30 per cent and 45 per cent of total deaths respectively. Till the age of 40, female mortality is higher than male, probably due to cultural factors bearing on diet and relative standard of care of the two sexes. The infant mortality rate (IMR) is grossly underestimated by the vital registration data. Despite this observation one fails to understand the utility of including Table 95. Early childhood (1-4 years) mortality constitutes about half the number of infant deaths, in the developing countries as a whole, as against about one-fourth in developed countries. As regards the proportion of maternal mortality to all deaths, the decline from 1.5 per cent in 1966 to 1.1 per cent in 1979 is highlighted by Jain, leaving one to wonder whether such a change could at all be reliably measured. Again, the explanation offered for higher male expectancy of life at birth relative to that of females is merely speculative; statistical tests should have been applied to test whether real differences exist.

Human fertility remains inscrutable, as would be evident from the population projections attempted in the past. The review of population projections made by Natarajan is very interesting, but it is exasperating too to notice the projected estimates falling by the wayside. In general, short-term projections lead to overestimates and long-term ones to underestimates. The closeness of a projection with the actual census counts is more fortuitous than due to any ingenuity of the particular methodology. This prestigeous tool of demography does, however, provide the country's planners with estimates of future population.

The aspects of growing labour force, educational development, food supplies, status of women, etc, discussed in the subsequent chapters help develop some insights into the problems and prospects of the growing population but some of the analyses presented could be misleading, while some leave enough scope for important findings.

The observed decline in the work force participation rates (WFPR) over time reflects changes in age structure, relative shift from rural to urban areas and school enrolment, argues Krishnamurthy without however defining WFPR. He postulates that the Indian economy will have to contend with a work force growing at the rate of 2.2 per cent or more in the years to come. The changes in unemployment rates at the national level are so microscopic that the author's assertions about increase/decrease cannot be taken for granted.

### SOCIO-ECONOMIC VARIABLES

It is admitted that there is lack of good data at the macro-level to indicate definite relationships between population and socio-economic variables. The micro-level studies are numerous but not always convincing. The data cited in Table 195 by Bhaskar Misra seek to prove a generally higher chance of survival of children in upper caste people than among the lower caste. The author should, however, have quoted the number of samples studied for each caste and one would like to have this study replicated.

In an elaborate treatise on educational development, Premi notes that the changes in school enrolment ratios over the decade 1961-71 barely went beyond taking care of the demographic component of school enrolment and were not commensurate with the task of universalisation of elementary education and that India is not likely to achieve this objective even by the end of the century—a sad commentary on educational planning indeed. The analysis of the relationship between the decadal population growth, urban growth and growth of workers and educational variables like growth of literacy and growth of elementary stage enrolment, however, leaves much to be desired, there being even hardly any consistency between what is discussed in the text and what is given in Table 216. How could the effect of urbanisation on the growth of literacy be examined by a mere examination of correlation coefficient? The last para of column one of page 344 is also based on a wrong interpretation drawn from examination of correlation coefficient, which certainly does not bring out a cause and effect relationship. Some of the Tables presented are also not framed properly, showing lack of uniformity of presentation (enrolment ratios are not given in Table 222 but are supposedly given in Table 224 though the column headings do not bring this out).

Lotika Sarkar seems to place undue stress on the practice of destroying female foetuses using 'amniocentesis', the knowledge and practice of which may be limited to the metropolitan cities only and that too to a privileged microscopic minority. It is, however, argued well that law should not be used as an instrument of compulsion to achieve the small family norm but that it should be achieved through increased education and employment opportunities for women. Unfortunately, it is observed that during the three decades since independence there has been a deterioration in women's status, educational progress being confined to a few pockets.

As for the trends in urbanisation, it may be mentioned that the definitional differences with respect to the pre-1961 period and the period from 1961 would render any exercise in tracing the trends in urbanisation infructuous. There should be comparability of the universes, if that is what Ashish Bose means by 'statistical point of view'. Bose indeed makes 'pedestrian' usages (to take on loan his own usage, first para, page 47) of the terms 'statistical test' and 'statistical precision'. It is mentioned that an interesting aspect of urbanisation is the phenomenon of 'declining towns' that is, towns which recorded a net decrease in population during 1951-61. This feature is due more to a 'declassification of towns' (as he himself points out) than any demographic phenomenon itself. With similar definitions adopted in 1961 and 1971 no such feature is observed as regards the number of town groups (see Table 23). Finally, the analysis presented devolves around the concept of urbanisation equated to a mere rate of increase of urban population which subsumes the homogeneity of the urban universes (with respect to the criteria adopted for defining) through successive censuses. The reliability of such an exercise depends on whether all the criteria were taken into account uniformly in all the censuses.

Srinivasan traces the population policies evolved during successive five-year plans. Table 110 compiled by him is particularly interesting, as the national goals of reducing the crude birth rates are seen to experience ups and downs—at the end of a five-year plan, an upward revision is seen (presumably because of poor performance). The family planning programmes assumed increasing importance till the Sixth Five-Year Plan (1978-83) when health, family weflare, MCH and nutrition services were integrated. The family planning performance is seen to vary between the states. This chapter purports to cover a very important area and the reader would have liked to know the relative contribution of programme inputs and socio-economic variables towards decline in fertility. While this has not been attempted, Haryana's example (Table 118) negatives the author's contention about the role of urbanisation, education, employment and income in family planning performance. The purpose of presenting the changes in Effective Protection Prevalence (EPP) per thousand eligible couples during April 1, 1977 to October 1, 1978 is not clear—the trends should have been obtained at least for a few more years. One would certainly get lost in the plethora of assumptions made by Srinivasan in his attempt to estimate the births averted through the family planning programmes.

### POPULATION AND FOOD

Lastly, Asok Mitra's massive chapter on 'Population Growth and Food Supplies' deserves special mention because of the only attempt in this volume towards 'multivariate' analysis. Unfortunately, the statistical tools have been misused and the data misinterpreted. As elsewhere pointed out, there indeed are limitations of high correlations adjudged from correlation coefficients stretched to cause-effect relationships. Asok Mitra not only seeks causation from the magnitude of a correlation coefficient but uses the correlation matrix obtained through the exercise on multiple regression to derive a series of cause and effect relationships and further compares the same with the findings of regression analysis, mentioning that the findings of correlation analysis are 'confirmed' by those of regression analysis. What more confusion could there be in the application of the technique of multiple regression? Specific instances are not pointed out because of limitations of space. Further, when the variable 'food surplus' is regressed on the variable 'total population', the regression coefficient of −0.1429 [4(i) and 6(ii), Table 213, p 307] is interpreted by Mitra as "human labour is still responsible for creation of food surplus", an inverse relationship taken as a direct one. It is surprising to note further that it remained unnoticed by the author that at two different places he holds population pressure to be a positive factor for deficit as well as surplus. Moreover, as the proportion of work force to total population variable for agriculture varies over the districts (the units of analysis), taking 'total population' as a proxy to 'labour input' is not justified. Again, three analyses on 'food surplus' districts, 'food deficit' districts and all districts, on different sets of units are done (Tables 212-214) but there is ony one correlation matrix (Table 211) claimed to be based on 273 units. There are reasons to believe that the correlation coefficients of food surplus and those of food deficit with other variables are based on different sets of units, that is, 177 and 96 units, respectively, but accommodated in Table 211 (an improper procedure). Much indeed can be said about the selection of variables. For example, the tenth variable "the sum total of food deficit and food surplus in a district" is quite interesting, assuming positive values (perhaps) for surplus districts and negative ones for deficit districts. This variable does not figure in any discussion, neither is its import explained. There are conceptual lapses too. The computation of the "Gini coefficient of concentration of land owned" (footnote 23, page 301), for example, indicates clearly that the data on cultivated land and not owned land have been used. The Gini coefficients therefore relate to 'operational holdings' and not 'ownership holdings'. It is inappropriate to use one concept while associating with the other. In this case particularly, the two distributions of ownership and operational holdings being radically different and the Gini coefficients for 'ownership holdings' being higher than those for 'operational holdings', the exercise by Mitra is misleading.

These comments are not to deny the credit due to the Steering Committee for the tremendous effort put in to bring out this very useful monograph. The very weight of the volume with data relating to almost every aspect of population would make it a much sought after volume for planners, research workers and teachers of demography.

# Inter-Connections under MRTP Act in the Context of Asset Limit Hike

**K S Chalapati Rao**

*Since size of assets, which was expected to reflect the economic strength of individual units and of groups of undertakings, has been chosen as a criterion for registering under the MRTP Act's provisions relating to concentration of economic power, growth in the assets of industrial Houses has generally been seen as proof of the failure of the Act in curbing the growth of concentration of economic power in private hands. While the phenomenon of non-registration of many of the recognised House-companies and the reasons for this have been discussed widely, the basis of inclusion of companies in different Houses for the purpose of arriving at House-wide asset figures is not widely known. This assumes importance because of another relatively little known fact that a number of companies which are included in different Houses do not admit inter-connection among themselves.*

*This paper attempts to examine the phenomenon through case studies of the two largest Houses, the Birlas and the Tatas, and by citing important cases belonging to some other Houses. This is done mainly on the basis of studying year-wise registrations, supported by the limited information available in the MRTP Commission's reports and orders issued under the Act. An examination of de-registration under the Act has also been taken up at the end of the paper.*

*This exercise is expected to help in a better understanding of the administration of the MRTP Act as also of the implications of the hike in the asset limit from Rs 20 crore to Rs 100 crore for registration under the Act.*

## INTRODUCTION

THE Monopolies and Restrictive Practices Act (MRTP Act) was enacted in 1969 to prevent concentration of economic power to the common detriment, for control of product monopolies and for the prohibition of monopolistic and restrictive trade practices. While the idea and the format of the Act were a consequence of the recommendations of the Monopolies Inquiry Commission (MIC, 1965), the Industrial Licensing Policy Inquiry Committee (ILPIC, 1969) was the source of inspiration for the licensing policy towards the MRTP Act registered companies.[1]

Ever since the beginning, the functioning of the Act has been a subject of much controversy. Since size of assets, which were expected to reflect the economic strength of individual units and of groups of undertakings, has been chosen as the criterion for registering under the provisions relating to concentration of economic power, growth in the assets of industrial Houses has generally been seen as proof of the failure of the Act in curbing the furtherance of concentration of economic power in private hands. While the phenomenon of non-registration of many of the recognised House-companies and reasons thereof have been discussed widely the basis of inclusion of companies in different Houses for the purpose of arriving at House-wise asset figures is not widely known. This assumes importance because of another relatively unknown fact that a number of companies which are included in different Houses do not admit Inter-Connections (IC) among themselves. This paper attempts to study this phenomenon through case studies of the two largest 'Houses', Birlas and Tatas, and by citing important cases belonging to some other Houses. This is done mainly on the basis of studying the year-wise registrations, supported by the limited information available in the MRTP Commission's reports and Orders issued under the Act. An examination of the de-registration under the Act has also been taken up at the end. The present exercise is expected not only to help in a better understanding of the administration of the Act in the light of which it was amended in 1984 but also to understand the implications of the proposed hike in the asset limit from Rs 20 crore to Rs 100 crore for registration under the Act.*

## THE BACKGROUND

In view of the important place of the Act in Indian economic legislation, its functioning has been studied by a number of scholars and official committees which helped in bringing out the various shortcomings in the administration of the Act.[2] One of the main points of criticism has been that of large scale non-registration of companies which are believed to be constituents of different industrial Houses. It was initially expected that all companies included in the twenty Larger Industrial Houses (LIHs) by the ILPIC would automatically get themselves registered under the Act as the Rs 20 crore asset limit adopted for purposes of the MRTP Act was much smaller than the ILPIC's limit of Rs 35 crore for LIHs.[3] However, this was not to be. For instance, as many as 512 companies identified by the ILPIC as belonging to the twenty LIHs were found to have not registered themselves under the MRTP Act.[4]

Abolition of the managing agency system[5] coupled with the loopholes in the criteria—leaving the investment companies outside the scope of 'undertakings' was an important limitation—and the absence of an enforcing authority has resulted in many companies remaining outside the scope of the Act. Besides, many multinational companies could avoid registration under the Act as the criteria could not take note of ICs outside India.[6] This is only logical because registration under the Act not only entails them to get additional clearances under a number of circumstances like effecting expansion, establishment of new undertakings, taking over or amalgamating other undertakings but their area of further expansion also gets confined to what are now referred to as Appendix I industries. The Act has been amended a number of times, the most recent one being in June 1984. The High Powered Expert Committee on Companies and MRTP Acts (Sachar Committee), which submitted its report to the government in 1978, had suggested a number of important changes in the criteria for IC which became the basis for the amehdment of the Act in 1984.[7]

In spite of its limitations, the Act is held in disfavour by the private sector. The main note of discordance is in terms of the licensing policy applicable to the MRTP Act covered companies. Over a period of time, a number of relaxations have been allowed in this respect, particularly when the respective companies agree to export a substantial portion of the increased output or to set up their manufacturing units in notified backward areas. There have also been pleas for increasing the asset limit for registering under the Act for a long time. In their report submitted to the Janata government a group of industrialists had asked to increase the limit from Rs 20 crore to Rs 45 crore.[8] The Sachar Committee, however, did not find it necessary to change the limit at that time. Raj Krishna had suggested Rs 100 crore as the limit in 1979.[9] Paranjape also felt that there was a case for increasing the asset limit due to the increase in the price level. He suggested a limit of Rs 50 crore in the case of aggregate concentration and Rs five crore in the case of dominant undertakings. This, he expected, would facilitate in not only taking a closer look at the proposals of undertakings representing significantly large concentrations of economic power but also in quicker disposal of those applications as well as in studying ICs of such undertakings which had largely been neglected hitherto.[10] Recently, the Bharat Ram Committee had asked for a Rs 100 crore limit.[11]

---

* This paper was prepared before the enactment of legislation raising the limit on assets of companies covered under the MRTP Act.

TABLE A

| Section(s) under which Covered | Implication |
|---|---|
| 20a(i) | **Single large undertaking**: The company has assets of Rs 20 crore or more and it does not accept inter-connection with any other company. |
| 20a(ii) | **Inter-connected undertaking**: The company has assets of less than Rs 20 crore but is inter-connected with another company having more than Rs 20 crore assets or the group of inter-connected undertakings to which the company belongs has assets of more than Rs 20 crore (none of them may individually possess assets of Rs 20 crore). |
| 20a(i)(ii) | **Large undertaking having inter-connected undertakings**: The company has assets of Rs 20 crore and above. It is also inter-connected with at least one undertaking. |
| 20b(i) | **Dominant undertaking**: Has a market share of one-fourth or more in the production or distribution of a product or a service and also has assets of not less than Rs one crore. It does not admit inter-connection with any other undertaking in terms of 20a(ii). |
| 20b(ii) | **Inter-connected dominant undertaking**: The company along with it inter-connected undertakings controls at least one-fourth market share of goods or services of a particular discription and their combined assets amount to not less than Rs one crore. |
| 20a(i)b(i) | **Single large undertaking which is also dominant**: The company has assets of not less than Rs 20 crore and a share of at least one-fourth in a particular product line. |

The finance minister in his budget speech had announced the government's intention to increase the asset limit for registration under the MRTP Act from Rs 20 crore to Rs 100 crore in order to reflect the considerable increase in the cost and economic size of the projects since its enactment in 1969. A view credited to the Narasimham Committee was that it was unfair to keep the smaller of the industrial Houses in the same bracket along with the truly large ones like the Tatas and the Birlas whose assets exceed Rs 2,000 crore. Various estimates have been made to find the likely beneficiaries of the proposed asset limit. While one estimate put the number of beneficiary large Houses at 49, the other finds that 60 Houses would take advantage of the enhanced limit.[12] These expectations are based mainly on the House-wise asset data presented in Parliament, adjusted for growth during the past couple of years. The basic assumption underlying these predictions is that only industrial Houses with less than Rs 100 crore of assets would benefit from the proposed hike. However, an examination of the operation of the registration system under the Act suggests that this sharp increase would benefit a larger number of Houses irrespective of their present reported assets. A study attributed to the Department of Company Affairs estimated that the number of Houses under the MRTP Act would drastically come down from 184 to 58 and only about 800 companies would remain under the ambit of the Act.[13]

### INTER-CONNECTIONS AND REGISTRATIONS UNDER THE ACT

Probably not many know that registrations under the MRTP Act are done not as constituents of a particular industrial 'House', but as those IC with a particular company or a group of companies—'Group of Inter-Connected Undertakings' (GICU). Registration of companies attracting the provisions of the Act is done under Section 26 of the Act based on the criteria provided in Section 20. The basis for determining IC is provided in Section 2(g) of the Act. The main criteria for establishing IC between two companies is that one of the companies holds not less than one-third of the equity shares in the other or controls the composition of not less than one-third of the total membership of the board of directors of the other. The 1984 amendment to the Act reduced the requirement of one-third equity/control over board to one-fourth. Subsection 20(a) of the Act deals with cases of concentration of economic power, while 20(b) deals with product monopolies. At present, a company needs to get itself registered under the Act, if (i) it has assets of Rs 20 crore or more by itself or (ii) it controls along with its IC undertakings assets of Rs 20 crore or more. Similarly, undertakings which (i) either by themselves, or (ii) along with their IC undertakings, possess not less than one-fourth[14] share in the production or supply of goods of any description and also have assets of at least Rs one crore would attract the provisions of Section 20(b). A company can be registered under more than one Section of the Act depending upon the provisions applicable to it. The explanations given in Table A make this point clearer.

Information on registrations and cancellations under Section 26 of the MRTP Act is being reported regularly since the mid-seventies in the *Company News and Notes*, a journal of the Department of Company Affairs. It reports the date of registration and the Section(s) under which a company was registered. The latest information in published form is available in the September 1984 issue of the journal which gives the registrations and cancellations made during April-June 1984. Information on the names of IC undertakings, which would have been very useful, however, is not provided in the journal. Some information on individual ICs, however, can be gleaned from the Reports of the MRTP Commission prepared in connection with the applications referred to them by the government and the orders of the government on the applications of individual companies. The journal has for some time also been reproducing replies to important questions asked in Parliament relating to Companies and MRTP Acts. From the journal we could get the lists of undertakings registered under the Act as at the end of 1975 and 1976.[15]

Though the registrations are not done on the basis of House, Parliament is occasionally provided data on the composition and strength of different industrial Houses whose undertakings are registered under the MRTP Act, at the request of the members. Such a House-wise list of undertakings as at the end of 1978 is reproduced in the *Company News and Notes*.[16] Besides, the Corporate Information System of the Indian Institute of Public Administration has a House-wise list of undertakings registered under the Act as on June 30, 1978 and an alphabetical list of such undertakings for the year 1979 (1979 Alphabetical List) which were obtained from the Department of Company Affairs. For the sake of convenience we shall refer to these House-wise lists in the following as the June 1978 and December 1978 lists. The latest year for which we could obtain a House-wise picture, though only for 10 Houses, is 1981.[17] House-wise aggregate asset figures for the year 1982 were reported in Parliament in February 1984 (hereafter referred to as 1982 House-wise Assets List).[18] This list is useful in knowing the names of industrial Houses falling under the purview of the MRTP Act as at the end of 1982.

On the basis of the 1981 House-wise list we make, in the following, a detailed analysis of the reported registrations under the MRTP Act of companies 'belonging' to the two largest Houses namely, the Tatas and the Birlas.[19] It should be clearly understood that the following analysis of the two Houses is mainly confined to the undertakings registered as on December 31, 1981, thus excluding the ones de-registered after initial registration, whatever might be the reason (e g nationalisation, amalgamation, changes in inter-connection, etc). However, to a limited extent, information on past registrations and cancellations is also made use of. Dates of registration of the companies in these tow Houses and the Sections under which they have been registered is determined on the basis of the 1979 Alphabetical list and the reported registrations in the *Company News and Notes.* In case of some companies which have been registered for a long time, there may have been changes in the applicability of the provisions of Section 20 of the Act after initial registration. The 1979 Alphabetical list unfortunately does not contain any information in this regard.

## THE TATA HOUSE

Table 1 shows the constituents of the Tata House, arranged according to the date of registration, along with the Section(s) under which they are registered and their assets in 1981. It also indicates whether a particular company was included in the House of Tatas by the ILPIC. It can be seen that out of the 13 companies registered in 1970, the first year of the enforcement of the Act, Tata Chemicals, Voltas, TISCO and TELCO were registered as single large undertakings, thereby implying that they did not accept IC with any other undertaking. However, the presence of Steel City Press, a subsidiary of TISCO at that time suggests that TISCO must have applied for registration as an a(i) company initially, with the subsidiary following suit as an a(ii) undertaking. This view gets strengthened by the fact that Voltas was registered as an a(i) company in 1970, and Voltas International, which became its subsidiary in 1978, got itself registered in 1979 as an a(ii) company. Technically speaking, the registration of Voltas must have then been changed from a(i) to a(i)(ii) after the registration of Voltas International, as the latter would at least be IC with Voltas, if not any other.

It can also be expected that the three power companies namely, Tata Power, Andhra Valley and Tata Hydro Electric, which were registered as a(i)(ii) companies must have done so because individually they had assets of more than Rs 20 crore and had also accepted IC among themselves.[20] The investment portfolio of TISCO in 1970-71 suggests that Cyanides and Pigments, Belpahar Refractories (now its subsidiaries), Tata S and L Sales, Tata Yodogawa and Indian Tube

TABLE 1: COMPOSITION OF THE TATA HOUSE
(as on 31-12-1981)

| S No | Name of the Company | Parent Company | Covered under Section | Date of Reg | Assets (Rs cr) |
|---|---|---|---|---|---|
| 1 | Stewarts and Lloyds of (I) | | a(ii) | 19-10-70 | 12.30 |
| 2 | Tata Power* | | a(i)(ii) | 19-10-70 | 106.63 |
| 3 | Cyanides and Pigments* | TISCO (now) | a(ii) | 20-10-70 | 0.35 |
| 4 | Tata Hydro Electric Power* | | a(i)(ii) | 20-10-70 | 43.81 |
| 5 | Tata S and L Sales* | | a(ii) | 22-10-70 | 0.07 |

| 35 | Sarada Latham Business Mach | FORBES | a(ii) | 25-11-78 | 0.20 |
| 36 | Tata Burroughs | | a(ii) | 30- 5-79 | 7.09 |
| 37 | Tata Exports | | a(ii) | 31- 5-79 | 71.90 |
| 38 | Voltas International | Voltas | a(ii) | 31- 8-79 | 0.25 |
| 39 | Crescent Iron and Steel Corp | Voltas | a(ii) | 26- 9-80 | 0.92 |
| 40 | Wandleside National Conductors | Voltas | a(ii) | 26- 9-80 | 2.03 |

*Notes:* * Indicates that the company was included in the Tata House by the ILPIC.
@ Indicates that the company was shown as a 2-tier one of the same House.

*Sources*: House composition and asset data are based on the reply to the Unstarred Question No 10 provided in the Rajya Sabha on July 25, 1983. Date of registration and the section(s) under which a company is covered are based on the 1979 Alphabetical List of Undertakings registered under the MRTP Act (available with the Corporate Information System, IIPA) and various issues of *Company News and Notes*. Assets of Svadeshi Mills Co and Shourie Duplicators are for 1980 and in all other cases they refer to 1981.

Co (registered in 1971) in which TISCO had more than one-third share at that time might have accepted their IC with TISCO. Though enough details are not available about the IC of Stewarts and Lloyds, it might have accepted its IC with TISCO. Tata Robins Fraser must also have accepted IC with TISCO since the latter, besides being its promoter, also holds substantial equity shares in it. Indeed, Parliament was informed in 1979 that the TISCO Group consisted of nine companies, *viz*, TISCO, Belpahar Refractories, Cyanides and Pigments, Indian Tube Co, Steel City Press, Stewarts and Lloyds, Tata Robins Fraser, Tata S and L Sales and Tata Yodogawa.[21] This leaves Tata Chemicals, Voltas and TELCO all of which are registered as a(i) undertakings.[22]

Nearly two years after the registration of Indian Tube Company, Tata Oil Mills Co (TOMCO) had got itself registered, along with its two subsidiaries, International Fisheries and Lakme. A possible explanation for this again could be that these three companies accepted IC among themselves and they had to register as their combined assets crossed the Rs 20 crore limit. TOMCO's registration under Sections a(i) and a(ii) also means that TOMCO by itself had crossed the Rs 20 crore limit. This type of inference becomes inevitable as all the three were existing companies at the time of the ILPIC and all of them were included under the House of Tatas by the Committee and it took them nearly two and a quarter years to register under the Act after the registration of the first batch of 'Tata' companies in 1970.[23] Industrial Perfumes might also have accepted its IC with TOMCO in 1975 as the latter holds substantial share capital of it.

Similarly, the four textile companies Svadeshi Mills, Ahmedabad Advance, Central India Spg and Coromandal Garments must have accepted IC amongst themselves and hence got registered under a(ii), in 1976. Once again, it can be noticed that all the four companies were included in the Tata House by the ILPIC and their registration had taken place six years after the Act came into force. Associated Bearing and Shefko India Bearing must also have got registered in 1977 as the former's assets exceeded the Rs 20 crore limit and they accepted IC between themselves.[24] Forbes Forbes Campbell and its subsidiaries along with Indian Vegetable products (since taken over by the Allana Sons Group) and Shourie Duplicators (since de-registered) are likely to be another group of companies which accepted IC among themselves. Interestingly enough, the government observed in 1971 itself that Forbes Forbes Campbell was IC with Tata Sons Pvt Ltd, Sassoon J David and Co Ltd and Investment Corpn of India Ltd. While Sassoon J David and Investment Corpn of India did not register themselves until June 1984 (possibly under the plea of not being 'undertakings' as per the MRTP Act), Tata Sons got itself registered in 1977, i e, nearly three years after the registration of Forbes Forbes Campbell. Tata Sons was in fact served a default notice in January 1976.[25]

Further evidence to the fact that a number of important Tata companies did not accept IC and the basis for such non-acceptance is available in the report of the MRTP Commission submitted to the government (in December 1971) in connection with TELCO's application for substantial expansion of its manufacturing capacity of commercial vehicles. In his dissenting report Paranjape stated:

> The company (TELCO) has unequivocally stated that it is not inter-connected with any other company in terms of the MRTP Act. A similar statement has been made by TISCO and many other Tata Companies to whom a questionnaire had been addressed by the Commission. The implication of these answers appears to be that while the inclusion of these companies as belonging to the larger House of Tatas might have been justified according to the criteria adopted by the Dutt Committee, the criteria laid down for defining the inter-connected concerns under the MRTP Act are quite different and the claim of the companies was and is that they are not inter-connected in that sense, especially in view of the abolition of the managing agency system from April, 1970.[26]

At this point one would like to know the basis on which these companies were included in the Tata House as they clearly appear to be forming smaller GICUs. A likely explanation is that the government may still be broadly following the ILPIC's classification. (It may be recalled that initially the government accepted the Committee's classification and subjected the constituents of the Larger Industrial Houses to stricter licensing provisions.) Whenever fresh registrations take place, either those of ILPIC-identified companies or of those which are clearly IC with the already registered 'House' companies, the government may be including them in the 'House'.[27] In the case of new Houses, the procedure could be to name the House either on the basis of the prominent company in the GICU with which most of the other companies are IC or after the controlling family (e g, Oswal Woollen Mills, IMFA, Sawhney and B D Somani).

However, the problem becomes more complicated if we go slightly beyond the above official list of Tata House companies. Table 2 contains a list of selected companies which got themselves registered under the Act during the post-1979 period. They were selected because all of them are related to the Tata House in some manner or other. It may be mentioned that Parliament was informed on March 15, 1982 that registrations of two companies belonging to the Tata House took place during the period January 1980 to December 1981.[28] Since the first two companies namely Crescent Iron and Steel and Wandleside National Conductors, both subsidiaries of Voltas, also appear in Table 1, one would expect that the reply was referring to these two companies only. Of the six companies shown in the Table as registered during 1981, Gokak Patel and Goodlass Nerolac have two subsidiaries each. It may be noted that Goodlass Nerolac was included in the Tata House by the ILPIC. Gokak Patel Volkart was formed through the amalgamation of Gokak Mills (classified as a Tata Company by the ILPIC) and Patel Volkart Ltd. Why was it then that only two additions were shown against the Tata House for the period January

TABLE 2: SELECTED TATA HOUSE RELATED COMPANIES REGISTERED UNDER THE MRTP ACT AFTER 1979

| S No | Name of the Company | Parent Company | Covered under Section(s) | Date of Registration |
|---|---|---|---|---|
| 1 | Crescent Iron and Steel Corp | Voltas | a(ii) | 26- 9-80 |
| 2 | Wandleside National Cond | Voltas | a(ii) | 26.- 9-80 |
| 3 | Gokak Patel Volkart | | a(ii) | 22- 6-81 |
| 4 | Patel Cotton Co | Gokak | a(ii) | 8- 7-81 |
| 5 | John Fleming and Co | Gokak | a(ii) | 28- 8-81 |
| 6 | Chanda Paints (Madras) | Goodlass | a(ii) | 31-12-81 |

| 14 | Excel Industries@ | | a(i) | 27- 4-84 |

*Notes:* * Indicates that the company was included in the Tata House by the ILPIC.
@ Indicates a 2-tier company.

*Source*: These are selected from the lists of undertakings registered under Section 26 of the MRTP Act published in various issues of *Company News and Notes*. Date of registration and section(s) under which covered are also taken from the journal.

1980-December 1981? The answer can be found in the reply to another question in the Parliament which gave the 1982 House-wise Asset List. Gokak Patel was one of the reported Houses with assets of Rs 31.38 crore. It seems unlikely that Goodlass Nerolac was included in the Gokak Patel House because its addition would have taken the assets of Gokak Patel much beyond Rs 31 crore. Assets of Gokak Patel Volkart Ltd and Goodlass Nerolac Paints Ltd were Rs 27.30 crore and Rs 19.38 crore respectively as on December 31, 1981.[29]

Then where were Goodlass Nerolac and its subsidiaries placed? The 1982 list of Houses does not contain any Goodlass Nerolac House. Interestingly enough, one finds from the reply in Parliament given on March 15, 1982, referred to above, that four undertakings were registered as part of the Gillanders Arbuthnot House. From the default notices served on the companies for not registering under the MRTP Act, one finds that companies like Eyre Smelting, Gillanders Arbuthnot, Goodlass Nerolac, Indian Woodcraft, Jutlibari Tea, Tengpani Tea— the last two mentioned are subsidiaries of Gillanders Arbuthnot and Co—have been asked to register under the MRTP Act as part of the Gillanders Arbuthnot House.[30] On an examination of the registration lists for the period January 1980 to December 1981, it was found that besides Goodlass Nerolac and its two subsidiaries only Eyre Smelting was registered under the Act. Thus it can be inferred that the reply of March 15, 1982 was treating these four companies as part of the Gillanders Arbuthnot House.

However, a few relevant facts need to be mentioned here:

(i) neither Gillanders Arbuthnot and Co nor its subsidiaries hold any equity shares in Goodlass Nerolac;

(ii) Eyre Smelting and Goodlas Nerolac along with Waldies Ltd (which has since become a subsidiary of Gillanders Arbuthnot) have been associates of Lead Industries Group Ltd UK;[31]

(iii) Waldies has been registered under the Act since October 21, 1970 as a b(i) (dominant) undertaking;

(iv) Gillanders Arbuthnot itself is currently not registered under the Act;

(v) foreign equity in Gillanders Arbuthnot is held by Ogilvy Gillanders Co Ltd UK. (We have not been able to find any relationship between Gillanders Arbuthnot and Ogilvy Gillanders on the one hand and Lead Industries Group and Goodlass Nerolac on the other, except that Waldies, an affiliate of Lead Industries Group has recently become a subsidiary of Gillanders Arbuthnot. Surprisingly, we have not been able to find Ogilvy Gillanders and Co Ltd in the relevant volumes of *Who Owns Whom*);[32]

(vi) (a) Gillanders Arbuthnot was asked by the government in 1977 to register under the MRTP Act on the grounds that the company's assets together with those of the IC undertakings exceeded Rs 20 crore but the Directors of the company explained in their report to the shareholders that "in considering the inter-connections, the government had included in their list of undertakings, a number of companies with which this company admit no inter-connections; therefore, this view could not be accepted and the government were advised accordingly"; and (b) the company filed a writ petition in the Delhi High Court and in terms of the order of the High Court issued in October 1982 the "company is not registrable under the MRTP Act";[33]

(vii) Goodlass Nerolac was identified as a Tata company by the ILPIC while Gillanders Arbuthnot was shown as a company belonging to the Gillanders Arbuthnot Group;

(viii) Gokak Patel Volkart which holds 25.33 per cent of equity capital of thé company (the directors of the company make a special mention of the fact in their report to the shareholders) is the second largest shareholder of Goodlass Nerolac after the Lead Industries Group;

(ix) Investment Corpn of India and a few subsidiaries of Forbes Forbes Campbell hold a substantial number of shares of Goodlass Nerolac; and

(x) (a) there has been an interlocking of directorships between Gokak Patel, Goodlass Nerolac and Forbes Fobres Campbell; (b) in 1981 all the three had a common Chairman and after the death of the incumbant Chairman, these companies had once again opted for a common Chairman; and (c) all the three companies had changed their respective accounting years from January-December to July-June after the presentation of the 1981 Annual Reports.

It becomes clear from the above that Goodlass Nerolac has been closer to Gokak Patel rather than Gillanders Arbuthnot and Co. Placing it in the Gillanders Group appears to be somewhat strange particularly since the main company of which is itself not registered under the Act. It is surprising to find that while in a number of cases, the non-resident equity was not given much weightage in determining ICs and House affiliations, in this case so much emphasis appears to have been given to it. For instance, Hoechest Dyes and Hoechest Pharmaceuticals, both affiliates of Hoechest, Germany, have been placed under different Houses namely, Mafatlal and United Breweries respectively. Similarly, two Indian affiliates of the Hawker Siddley Group Ltd UK *viz* Crompton Greaves and Kirloskar Electric Co are being treated as constituents of the Thapar and Kirloskar Houses respectively.

### THE BIRLA HOUSE

We shall now analyse briefly the registrations of companies reported to be belonging to the Birla House. As in the case of the Tata House, later registrations tell an interesting story in the case of the Birla House too. The ILPIC had identified as many as 203 companies as constituents of the Birla House. A further 73 were termed as its second-tier companies. However, it can be seen from Table 3 that till the end of 1971, only 28 companies were registered. In the next two years another 11 companies got registered. Out of 28 companies registered

TABLE 3: COMPOSITION OF THE BIRLA HOUSE
(as on 31-12-1981)

| S No | Name of the Company | Parent Company | Covered under Section | Date of Reg | Assets (Rs cr) |
|---|---|---|---|---|---|
| 1 | Bihar Alloy Steels* | | a(i)(ii) | 26- 9-70 | 43.43 |
| 2 | Birla Jute Mfg* | | a(i)(ii) | 19-10-70 | 75.84 |

*Notes:* * Indicates that the company was included in the Birla House by the ILPIC.
@ Indicates that the company was shown as a 2-tier one.

*Sources*: House composition and asset data are based on the reply to the Unstarred Question No 10 provided in the Rajya Sabha on July 25, 1983. Date of registration and the section(s) under which a company is covered are based on the 1979 Alphabetical List of Undertakings registered under the MRTP Act (available with the Corporate Information System, IIPA) and various issues of *Company News and Notes*. Assets of Express Dairy, Hindustan Wire and Metal, Indian Plastics, Indian Rockwool and Texmaco are for 1980 and in all other cases they refer to 1981.

till 1971 as many as 12 were subsidiaries of other companies. Thus a simple IC of parent-subsidiary relationship can be established between the 12 subsidiaries and their seven respective parent companies.[34] One company, namely Hyderabad Asbestos Cement has been registered as an a(i)b(ii) undertaking.[35] While National Engg Industries is shown in the Table as an a(ii)b(ii) undertaking it was initially registered as a b(i) undertaking only.[36] Zuari Agro Chemicals, a company promoted by Birla Gwalior in collaboration with Armour and Co USA, in 1967, was registered as a single large undertaking in 1971.[37] One can notice clearly that registration of the ILPIC-identified companies was continuing into the eighties. Some of the well-known Birla companies which took a long time to register under the Act include Jayshree Tea and Bharat Commerce and Industries both of which got registered in 1978 as single large undertakings.

A study of the MRTP Commission's reports on HINDALCO and other Birla companies clearly brings out the difficulty in making the companies of the Birla House accept ICs. For instance, the report on HINDALCO reveals that companies like HINDALCO, Kesoram Industries, and Gwalior Rayon had not admitted IC *inter se* or with any other companies excepting their own subsidiaries in terms of Section 2(g) of the MRTP Act. However, after a long delay in the clearance of its proposal, HINDALCO amended its application. According to the Commission report in the revised application submitted to the government it was stated that

> considering the provisions of the law the applicant company is not inter-connected with any company except those mentioned in its original application. However, purely with a view of facilitating and expediting the disposal of the application, the applicant agrees for the limited purpose of the disposal of the present application, that it may be assumed that the applicant company is inter-connected with the following companies.[38]

Similar amendments were also made by Birla Jute, Kesoram Industries, Gwalior Rayon and Century Spinning in their applications. When the Commission wrote to all the companies IC in such a manner, to ascertain views on the IC no company except Zuari Agro denied the assumption of IC or raised any objection.[39] It may be noted that before deciding on the proposals of the above mentioned companies, the Commission had entrusted the task of studying the IC of selected Birla companies to the Director of Investigation. (His report was annexed to the Commission's report on the application of Kesoram Industries.) The Director of Investigation in his report felt it pertinent to mention that

> even a limited study of 12 selected com-

> panies has revealed inter-connection amongst 72 Birla Group of Companies and as such if a full scale study is undertaken, it may be possible to establish inter-connection amongst a very large number of Birla Group of Companies.[40]

The Commission, however, decided not to proceed further in the matter of IC as it was satisfied that the type of amendment made by the applicant companies was sufficient for the purpose of disposing of their applications.[41] It seems that the government did not meet with much success in getting at least all the companies which accepted IC in the above stated manner. Companies like Birla Cotton, Birla Bombay, Birla Brothers, and Birla Consultants which did not reject IC are yet to register under the Act, in spite of default notices being served on them.[42] Another such company, namely, Sirpur Paper Mills had got itself registered in 1982 as an a(i) undertaking.

In the case of the Birla House also it was reported that two more companies had got registered during January 1980 to December 1981.[43] However, from Table 4 it can be observed that during this period four companies got registered which can be traced to the Birla House. Since Oriental Machinery and Universal Cables also appear in Table 3, we can assume that the reference was to these two companies only. The other two, which were registered as single large undertakings are again known to be Birla companies and both were included in the Birla House by the ILPIC. Then why were they not included in the Birla House in the reply relating to the 1981 assets position of Birla companies? Was it because they have been registered as a(i) undertaings? In that case why were the other a(i) companies like Zuari Agro Chemicals, Hyderabad Asbestos Cement and Jayshree Tea shown as belonging to the House?

A little more insight into the grouping of companies for the purpose of reporting House-wise asset figures can be obtained from the following. The Indian Rayon Corporation was shown as a part of the Birla House after its registration in 1979, but the subsequent House-wise lists did not include the company. Indeed, the company was later referred to as an independent/Indian Rayon House company,[44] Needless to say, this company was also recognised (ILPIC) Birla House company.[45] A number of companies which were till then being shown as part of the Birla House, were transferred in 1980 to the Somany Group. The companies were: Hindustan Sanitaryware and its two subsidiaries Soma Plumbing Fixtures and Ceramic Services; Hindustan National Glass and its subsidiary Glass Equipment (I); Somany Pilkington, Somany Properties and R B Rodda and Co.[46] Thus one can observe the tendency to shift companies from a House to another or to create a new House whenever there is any objection.

The post-1979 registrations further indicate that a number of well-known Birla companies did not accept IC with any other undertakings. Prominent among them are, Electric Construction and Equipment (ECE), Central India Machinery Manufacturing Co (CIMMCO), Century Enka and Zenith Steel Pipes.[47] CIMMCO was earlier registered in 1970 as a b(i) undertaking but got de-registered in May 1976. While Indian Tool Mfrs is registered as an a(i) company, the government feels that the "provisions of Section 20a(ii) are also applicable as the company belongs to the Birla Industrial House".[48]

Recently Parliament was informed that the assets of the Birla House rose from Rs 2,004.74 crore in 1982 to Rs 2,830.94 crore in 1983.[49] That is in one year their assets increased by Rs 826 crore. We find from Table 4 that four Birla companies got registered as a(i) undertakings during 1983.[50] Out of these four, one company, *viz*, CIMMCO did not accept IC with any other undertaking. If the remaining three companies were treated as constituents of the House then part of the increase in assets of the House in 1983 should be attributed to their inclusion. This again is related to the more fundamental questions of how the composition of Houses is determined and how far the reported asset figures of different Houses reflect their true strength? Our suspicion is that their growth rate could be an overestimate while the quantum of assets is an under-estimate. This is mainly because the House composition is being determined on the basis of registrations at a particular point of time.[51] When another company which is *otherwise* known to be a part of the House, is registered, it is included in the House provided it does not object to it. Thus a situation arises when no new company comes into existence nor any new ICs are established, the assets of a House increase simply because the status of a company has changed in terms of the MRTP Act. The tentative nature of the House composition and the asset figures becomes clearer from the careful wording of the following extract from the answer to a Parliament question given in 1977:

> Assuming registration under Section 26 of the Monopolies and Restrictive Trade Practices Act, 1969, as the basis for the grouping, as on September 30, 1977, 69 undertakings appear to belong to Birla Group.[52]

## OTHER INDUSTRIAL HOUSES AND SINGLE LARGE UNDERTAKINGS

In the following we present a few important cases which further illustrate the fact of non-acceptance of IC by companies of other industrial Houses. The relevant cases are shown in Appendix I. Ballarpur Industries Ltd (formerly Ballarpur Paper and Straw Board Mills) which was identified as a Thapar House company by the ILPIC, accepted IC with only 17 other undertakings, notable exceptions being Greaves Cotton and Co (also identified as a Thapar company by the ILPIC) and its subsidiaries.[53] Greaves Cotton later accepted IC with 23 undertakings, which was still less than the total

TABLE 4: SELECTED BIRLA HOUSE RELATED COMPANIES REGISTERED UNDER THE MRTP ACT DURING THE POST-1979 PERIOD

*Note*: * Indicates that the company was included in the Birla House by the ILPIC.
*Source*: These are selected from the lists of undertakings registered under Section 26 of the MRTP Act published in various issues of *Company News and Notes*. Date of registration and section(s) under which covered are also taken from the journal.

strength of the House as shown in the December 1978 list. There is a possibility of the House comprising of two independent GICUs since we can see from the Appendix that Ruston and Hornsby (India), a subsidiary of Greaves Cotton and Co, accepted IC with only 8 other undertakings while the total number of companies shown in the Group at the end of 1978 was 33.

Similarly, Atul Products of the Kasturbhai Lalbhai Group did not accept IC with any of the so-called Lalbhai Textile companies, *viz* Arvind Mills, Ashoka Mills, Nutan Mills, etc.[54] This fact came to light at the time of the examination of the Atul Products' proposal for manufacture of two antibiotic drugs and three types of weedicides by the MRTP Commission during 1973-74. The Commission felt that it was not necessary to go into the details of ICs of the company as far as the application of the company in question was concerned. They, however, noted that they "would not like to express any opinion in this report regarding this company's inter-connection with other companies belonging to the Kasturbhai Lalbhai and Imkemex India Ltd (of the ICI Group)".[55] Another company, Anil Starch Products, which was also identified as belonging to the House by the ILPIC accepted IC with only two companies.[56]

Another important example for non-acceptance of IC is that of Sarabhai Sons Pvt Ltd. The company which was included in the Sarabhai House by the ILPIC, had not accepted IC with Ahmedabad Mfg Calico Ptg Co (CALICO) another company included in the Sarabhai House, in view of the abolition of the managing agency system. It had also not accepted IC either with Suhrid Geigy Ltd or with Suhrid Geigy Tdg Ltd. The company, however, stated that these two companies were registered under the Act only by way of abundant caution.[57] It is interesting to note that out of the 11 companies with which the company had admitted IC four companies namely, Symbiotics, Standard Pharmaceuticals, Sarabhai Technological Development Syndicate and Travelera were shown as constituents of the Sarabhai House along with CALICO, Suhrid Geigy and Suhrid Geigy Tdg Co in the December 1978 list.[58] There was a reorganisation of a number of Sarabhai Group companies in 1977, which finally culminated in the emergence of the Ambalal Sarabhai Enterprises Ltd. Ambalal Sarabhai Enterprises got registered under the Act in 1979 and one finds that it is being treated as a constituent of the Sarabhai House along with CALICO.

Some other noteworthy cases are: DCM Ltd accepting IC with only DCM Intl (its subsidiary) and Shriram Fibres Ltd; Modi Rubber accepting IC with only three companies of the Modi Group; Dhrangadhra Chemical Works accepting IC with only its subsidiary namely, Plastic Resins and Chemicals; Premier Automobiles admitting IC with only its subsidiaries; and Bombay Dyeing accepting IC with only Nowrosjee Wadia and Sons Pvt Ltd. However, there are some Houses like Simpson, G V Naidu, Chowgule and Mafatlal in which the problem of non-acceptance of IC at least among the registered undertakings does not appear to be significant.

The following are a few more important cases which were not included in Appendix I. Bajaj Auto had contended that it was not inter-connected under the MRTP Act, and "it specifically pointed out that it was not IC with any companies in the so-called Bajaj Group".[59] It may be noted that the company was initially registered as a b(i) undertaking and subsequently as an a(i) undertaking also. Phillips Carbon Black Ltd, promoted by Duncan Brothers and Co Ltd and Phillips Petroleum Co USA, was shown alongwith Duncan Brothers and Co and four other companies as a Goenka Group company in the June 1978 list. However, in the December 1978 list, the company was not shown as a part of the House. This probably should be understood in the background that the company was registered as a b(i) undertaking, thus not accepting IC with any other undertaking in terms of Section 20a(ii). Similarly, Bharat Forge which was included in the Kirloskar House by the ILPIC has been registered as an a(i) undertaking and appears as a Kirloskar company in the June 1978 list. However, in the list it was explained that the company had represented to the government that it was not a part of the Group. It appears that the company's contention was accepted as it was taken out of the House and shown as a single large undertaking in the December 1978 list. Similar was the case with Swadeshi Polytex Ltd which was initially shown as a constituent of the Jaipuria Group.

It is interesting to note that in the case of J K Synthetics Ltd which has been treated as a company belonging to the J K Singhania House for purposes of arriving at the House-wise asset figures, a government order under the MRTP Act observed that the " . . . company was registered on December

TABLE 5: LIST OF SELECTED COMPANIES COVERED UNDER 20a(i) REGISTERED DURING JANUARY 1980 TO JUNE 1984

| Sr No | Name of the Company | Date of Registration | Remarks |
|---|---|---|---|
| 1 | George Williamson Assam | 23- 1-80 | FERA |
| 2 | Bhadrachalam Paper Boards | 24- 1-80 | Promoted by ITC |
| 3 | Britannia Industries | 11- 3-80 | Formerly under FERA |
| 4 | Orissa Cement | 17- 4-80 | Dalmia J |
| 5 | Tribeni Tissues | 18- 6-80 | FERA |
| 6 | Sandoz (India) | 22- 8-80 | FERA |
| 7 | Swan Mills | 27-12-80 | J P Goenka |
| 8 | Assam Company (India) | 27- 1-81 | FERA |
| 9 | Bayer India | 30- 1-81 | FERA |
| 10 | Bajaj Tempo | 29- 6-81 | Firodia |
| 11 | Sree Rayalaseema Paper Mills | 25- 7-81 | TGL |
| 12 | Dalmia Cement (Bharat) | 25- 8-81 | Dalmia J |
| 13 | Machinery Mfrs Corpn | 29- 3-82 | Mahindra |
| 14 | Vazir Sultan Tobacco Co | 4- 5-82 | Formerly under FERA |
| 15 | Hindustan Development Corpn | 22- 7-82 | Mody (Calcutta) |
| 16 | Aluminium Industries | 5- 1-83 | Seshasayee |
| 17 | Sandvik Asia | 9- 6-83 | FERA |
| 18 | Goodricke Group | 17- 2-84 | FERA |
| 19 | Hindustan Dorr Oliver | 1- 3-84 | FERA |
| 20 | Modi Alkalis and Chemicals | 24- 3-84 | Promoted by Modi Inds, Modi Rubber, Modi Spg and Modipon |
| 21 | Ingersoll Rand (India) | 19- 5-84 | FERA |
| 22 | Grindwell Norton | 19- 5-84 | FERA |

*Notes:* Though Orissa Cement and Vazir Sultan Tobacco are reported to have been registered under 20a(i) it appears that the provisions of 20a(ii) are also applicable to them as Konark Minerals and Vishwarama Hotels, subsidiaries respectively of these two companies, are also registered under the Act.

FERA status is as per the list of FERA companies reported in the Rajya Sabha on 26-3-1985 in reply to the Unstarred Question No 883 (reproduced in *Assocham Parliamentary Digest*, No 5, March 25-30, 1985).

*Source:* These are selected from the lists of undertakings registered under Section 26 of the MRTP Act published in various issues of *Company News and Notes*.

4, 1970 as an undertaking to which the provisions of Section 20(a)(i) of the Act are applicable and belongs to J K Singhania Group".[60] The 1979 alphabetical list also shows that the company to have been registered under a(i)b(i) only. The 1982 House-wise assets list shows Jyoti as a separate House. Jyoti Ltd which was registered under the Act in February 1982, however, was placed in the Amin House by the ILPIC along with Alembic Chemical Works and Alembic Glass and a number of other companies. Since the latter two have not yet been registered under the Act, one can infer that they did not accept IC with Jyoti Ltd.

It is also interesting to find that while the House-wise lists show Southern Industrial Corpn as a company belonging to the M A Chidambaram Group, it was mentioned to be belonging to the SPIC Group in one of the orders issued by the government under the MRTP Act.[61] It may be noted that SPIC (Southern Petrochemcial Inds Corpn) was promoted by Tamil Nadu Industrial Development Corpn in the joint sector with M A Chidambaram and K R Srivasta as the private promoters and is registered as an a(i) company and is shown as a single large undertaking in December 1978 list.

As has already been brought out, a number of House companies have been registered as single large undertakings. At the end of 1979, there were 46 undertakings which were registered either as a(i) or a(i)b(i) undertakings.[62] A further 48 were registered under a(i) during January 1980 to June 1984, the latest period for which information is available. Table 5 shows a list of selected companies registered during the latter period, excluding the ones which were already covered in Tables 2 and 4. This is intended to provide an idea of the composition of the single large undertakings category.

Apart from the presence of a number of companies which are covered under the Foreign Exchange Regulation Act, 1973, one also finds a number of companies which are believed to be constituents of different industrial Houses. For instance, Dalmia Cement (Bharat) has been registered as an a(i) undertaking. Further, a government order under the MRTP Act clearly states that the company had not admitted IC with any other undertakings.[63] However, it is pertinent to mention that the company (identified by the ILPIC as Dalmia J company) had been earlier under default notice since June 25, 1975 to register itself as an undertaking IC with Dalmia J Group of companies. When a number of companies to whom default notices were sent in a similar manner had contended that they did not form a Group, the Central government approached the Company Law Board to determine the question of Group as per Section 2(18A) of the Companies Act. The Company Law Board decided that

> the facts of the case clearly demonstrate that Shri J Dalmia and his relatives listed in Statement 'I', appended to the petition, constitute a Group within the meaning of Section 2(18A) of the Companies Act, 1956. We also hold that the said Group along with the companies listed in Statement 'II', annexed to the petition, and M/s Orissa Cement Ltd, M/s Dalmia Cement (Bharat) Ltd and M/s Dalmia Dairy Industries Ltd, constitute a Group within the meaning of Section 2(18A) of the Companies Act, 1956.[64]

Inspite of this, in the 1982 House-wise assets list, the company does not seem to have been treated as a part of the Dalmia J Group. The list contains a Orissa Cement House with assets of Rs 55.13 crore. However, Dalmia Cement (Bharat) is unlikely to have been included in this House as the assets of Orissa Cement itself were more than Rs 50 crore in 1982.

Similarly, Hindustan Development Corpn which was earlier asked to register under the Act as a part of the Mody (Calcutta) Group has been registered as an a(i) undertaking only. Another interesting case is that of Tata Finlay Ltd which had admitted IC with 8 undertakings of the Tata Group. The company had often been referred to as a Tata Group company, but now shown under the House in the House-wise lists. This has been continuing even after the dissolution of the James Finlay Group in India. While the June 1978 list shows it as part of the James Finlay Group in the December 1978 list the company was shown as a single large undertaking. As can be seen from Table 1, the company is not included in Tata House even in 1981.

Another important case is that of the Indian affiliates of the British American Tobacco (BAT) Group of UK, *viz*, ITC, Vazir Sultan Tobacco (VST), Tribeni Tissues and Molins of India.[65] ITC has been registered under the Act since 1970. It had promoted Bhadrachalam Paper Boards (BPBL) in 1975. From Table 5 we find that BPBL is registered as an a(i) undertaking. ITC's share in BPBL's equity is approximately 32 per cent while that of VST is 14 per cent. Interestingly enough, from the prospectus of BPBL one finds that ITC enjoys the right to appoint two or more directors, but always constituting less than one-third of the strength of BPBL's Board as long as ITC holds 25 to 33 per cent of equity of BPBL.

Unlike in the case of Gillanders Arbuthnot and Goodlass Nerolac we find that the operations of ITC and VST have not been altogether independent. For instance, it was complained to the MRTP Commission that these two companies have been indulging in restrictive trade practices and that they co-operate with each other by producing each other's brands. For instance, it was alleged that while ITC got some of its brands made by VST, ITC manufactured Charminar special brand of cigarettes for VST. ITC was the sole distributor for a number of brands of VST and it had "exclusive distribution rights for Charminar brand of cigarettes over many parts of the country".[66] We observed that except for three (out of seven) the rest of the directors of VST in 1983 were earlier with ITC. One of the remaining three was from Molins of India. Both ITC and VST hold shares in Molins of India, Vishwarama Hotels (subsidiary of VST) and Bhadrachalam Paper Boards. Incidentally the 1982 House-wise assets list treats VST as a separate House. Similarly, Tribeni Tissues which had been under default notice for its alleged IC with ITC, is now registered under a(i).

### DE-REGISTRATION

Another important aspect of the administration of the MRTP Act which had generally not been shown the attention it deserves is the de-registration of once registered undertakings. Normally, a company gets de-registered either if it is nationalised or amalgamated with another company or there were changes in the shareholding pattern/constitution of Board of Directors resulting in changes in IC or when a company is nationalised or taken over by another company resulting in the combined assets of the remaining undertakings of the Group falling below the Rs 20 crore limit and so on. Till the end of 1984 as many as 374 undertakings were de-registered while in the case of 408 undertakings applications for de-registration were rejected.[67] As the cases of nationalisation and take-overs are clear in nature and the severance of IC is obvious what one would like to know more about is the companies which have got de-registered either on the plea that they were no longer IC with the ones that continued to be registered or found that the IC cannot be established. This is because of the fact that a number of companies got themselves registered initially as they thought that they were also covered by the provisions of Section 2(g) of the Act[68] and some even claimed that they have got registered even if they were not IC only out of abundant caution.

The details regarding de-registration have been taken from *Company News and Notes* which, however, does not explain the reasons for de-registration.[69] A selected list of de-registered companies is given in Appendix II. In selecting these companies care has been taken to exclude nationalised and amalgamated cases as far as possible. If these de-registrations were allowed on the basis of changes in IC, a point worth enquiring into is whether these were accompanied by changes in actual control or they were only of a technical nature. This is because, the government sometimes imposes on companies restrictions like reduction of promoter's/controlling family's shareholding in the company so that the shareholding pattern of the company becomes broad-based while approving their proposals.

The following cases tend to suggest that de-registration need not necessarily imply de-linking from the respective industrial House. For instance, we find from Appendix II that Cyanamid (India) got de-registered during 1980. However, there was virtually no change in the board of directors of the company during 1979-1981 as can be seen from its Annual Reports for the years ending in 1979, 1980 and 1981. The only change that occurred during the period was the replacement of one of the representatives of American Cyanamid by another of its representatives. This should be seen in the background of the fact that Amercian Cyanamid Company and Atul offered a part of their shareholdings in the company to the public which resulted in the reduction of foreign equity in Cyanamid India from 65 to 55 per cent and that of Atul from 35 to 30 per cent. Cyanamid (India) applied for de-registration under the MRTP Act as "With the reduction of Atul's shareholding to 30 per cent in Cyanamid India Limited the inter-connection with Atul has been severed and the provisions of Chapter III of the Monopolies and Restrictive Trade Practices Act, 1969, should no longer apply to the Company".[70]

Similarly, while National Insulated Cable Co (NICCO) got de-registered under the Act in 1978, one finds that National Rolling and Steel Ropes (NRSR), a company regarded as a part of the NICCO Group[71] continues to be registered under the Act and the 1981 House-wise List shows NRSR to be a constituent of the Birla House (see Table 3) A comparison of the Annual Reports of NICCO for the accounting years ending in March 1976 and March 1979 brings out that the only change in the composition of the board of directors of the company during the period was the induction of one new director while the same persons continued to be the Chairman and Managing Director of the company. In addition, in 1979 three of the Directors of NICCO were also on the board of Associated Industrial Development Co Pvt Ltd, a company which continues to be registered under the Act and which is shown as a constituent of the Birla House in 1981 (see Table 3) and they constituted 60 per cent (three out of five) of its board.

Another case of interest is that of Roplas (India) Ltd of the Mahindra and Mahindra House. The company was initially registered under the MRTP Act in 1971. In 1972 it got registered with the Directorate of Small Scale Industries for the manufacture of fibreglass reinforced plastic products. However, after the reservation of fibreglass reinforced plastic products for the small scale sector and the change in the policy of the government which would make the company ineligible for exemption under the Industries (Development and Regulation) Act, 1951, the company applied for de-registration under the MRTP Act as according to its understanding "it is no more inter-connected with Mahindra and Mahindra Ltd".[72] A study which discussed the company's case in detail, cited a number of points to show that Roplas was "still a part of the House of Mahindras" and concluded that cancellation of Roplas'

## Appendix I

### VARIATION IN NUMBER OF INTER-CONNECTED COMPANIES AND COMPANIES INCLUDED IN DIFFERENT HOUSES

| Sr No | Name of the Company 1 | House Association 2 | No of Inter-connected Companies 3 | Date of Order under the MRTP Act 4 |

*Source:* Information on number of inter-connected companies is collected from the orders issued under the MRTP Act on the respective dates specified in col 4. For orders issued upto March 1980, we depended on India, Ministry of Law, Justice and Company Affairs, "Orders Passed by the Central Government Under Section 21, 22 and 23 of the MRTP Act, 1969", Vol I and II, 1982 and for the subsequent orders, various issues of the *Company News and Notes*. Figures in brackets indicate the number of companies shown in different houses as on December 31, 1978 in the reply to the Lok Sabha Unstarred Question No 8229 given on April 24, 1979, (see *CNN*, April 1979, pp 87-101). Except in the case of Aluminium Industries Ltd in all other cases the house association in col 2 is based on this list.

registration under the MRTP Act "demonstrates the weaknesses of the Indian anti-monopoly legislation".[73]

We have already seen from Appendix I that Bombay Dyeing accepted IC with only Nowrosjee Wadia and Sons Pvt Ltd. However, from Appendix II we can see that not only the latter company got de-registered but also a number of others like Botanium and Gherzi Eastern have got de-registered leaving only Bombay Dyeing, National Peroxide and Neville Wadia Pvt Ltd from the December 1978 list of Nowrosjee Wadia Group under the purview of the MRTP Act. One also finds that a number of undertakings of Chidambaram, Khatau and Thiagaraja Houses and all companies of the Ruia House got de-registered. The case of one of the Thiagaraja companies is revealing. The government in its Order dated March 5, 1982, approving the substantial expansion proposal of Loyal Textiles Ltd imposed a condition that

> The shareholdings of Thiagaraja Group, their directors, relatives, the bodies corporate holding shares in the applicant company at present and their interconnected undertakings and the directors and relatives of directors of such companies and undertakings shall be reduced to 40 per cent within one year from the date of the order.[74]

As can be seen from the Appendix, the company got de-registered on May 26, 1982 possibly because the Group reduced the required share to less than 33⅓ per cent instead of 40 per cent. However, a comparison of the Board of Directors of the company for the years 1980-81 and 1982-83 shows that out of nine directors of the company in 1980-81, seven (including the two Managing Directors) continued in 1982-83 as well, the remaining two in 1982-83 being nominees of IFCI and SIPCOT.

## CONCLUSION

The fact that the registrations of companies which were existing at the time of enactment of the Act and which were also placed in the Houses of Tatas and Birlas by official committees and commissions was spread over a long period clearly indicates that the criteria under the Act could not capture the relation between them. Considerable direct evidence is also available which shows that a number of companies of these Houses, registered under the MRTP Act, do not admit IC among themselves. This phenomenon is not confined to these two Houses only. Moreover, a number of important recognised House companies are yet to register under the Act. Attempts at getting them registered by issuing default notices and through legal proceedings have met with only limited success.[75] While the Commission itself is not in a position to take up the question of IC on its own, even in cases referred to them they were mainly concerned with establishing IC only when the question of dominance was involved. Barring the aborted attempts of establishing IC of Tata and Birla House companies no significant efforts were made in this direction.

A number of Houses are reported by the government from time to time are made up of smaller groups of IC companies. Many recognised House-companies have been registered under the Act not because they accept IC with the already registered ones, but due to the fact that their assets exceed the Rs 20 crore limit either singly or jointly with companies with which they are closely related. The government has been broadly following the House-classification made by the Industrial Licensing Policy Inquiry Committee and has been including companies under different Houses on that basis whenever they are registered, unless they have any objection. There have been instances of giving separate House status to recognised House companies if representations are made against such inclusion. This practice, one should expect, is adopted by the government as a compromise between what has come to be believed on the basis of earlier findings and what the criteria under the Act could achieve. Otherwise, one should imagine, assets data would have to be reported for a TISCO House, A TOMCO House, a Dhrangadhra House and a DCM House. Such reporting would probably have attracted public attention to the phenomenon of non-acceptance of IC. The reported asset figures are in any case indicative rather than definite proof of the strengths of respective Houses.[76]

This phenomenon acquires further significance in view of the recent proposal to increase the asset limit from Rs 20 crore to Rs 100 crore. In the light of what has been observed above it is only logical to expect that all those GICUs and single large undertakings, whether included in a House or not, would become eligible for de-registraion after the asset limit is increased, provided their assets are less than Rs 100 crore. Thus all Houses, irrespective of their present reported assets, can potentially take advantage of the asset limit hike. However, two points which have a bearing on this possibility need to be taken into account. One, the extent of benefit a House can derive depends to a large measure on its structure. If the GICU is made up of one single large company (assets in the range of Rs 100 crore) and a few smaller ones this hike is not going to affect its MRTP status. Similarly, for Houses in which the holding company type of structure is prevalent, the hike has very little significance. Second, and the more important one, is the change in the criteria for establishing IC introduced through the amendment of the Act which came into force from August 1984. Some of the significant changes incorporated are in respect of

*Note:* House association of companies de-registered after June 1978 is based on the June 1978 and December 1978 House-wise lists. In all the other cases it is based on ILPIC classification or information on inter-corporate investments or orders under the MRTP Act.

*Source:* Selected from various issues of *Company News and Notes.*

bringing investment companies under the purview of the Act, reducing the required control on equity and on the Board to one-fourth and introducing the definition of Group.[77] So far there are no clear indications as to the type of new registrations that had taken place due to the amendment except that 462 undertakings were registered under the Act during the period April 1, 1984 to December 31, 1984.[78] Though this number looks quite large compared to what has been the experience of recent years, it is still far short of the total number of companies which were expected to be registered.[79] However, one cannot ignore the fact that a number of companies got registered under the Act initially, some even out of 'abundant caution', but later got de-registered once they found that IC cannot easily be established. The relevant cases discussed above show that de-registration need not always be accompanied by severance from the respective Houses.

Bringing legal provisions nearer to reality and making them acceptable by those who would be affected by them is a difficult task. Doubts have already been expressed whether even with all the clarifications introduced "the concept (group) will fully and properly serve the purpose for which it is intended".[80] A number of Houses control their companies through a maze of inter-corporate investments with investment companies playing a major role.[81] Establishment of control of the House over all such companies requires an extensive organisational structure in the absence of which only the obvious type of ICs, particularly where direct shareholdings are involved, can be established. Another likely hurdle would be in identifying Associated Persons for purpose of establishing the Group. Much also depends on how the new criteria would be interpreted in respect of relatives, particularly brothers who are legally separated. Deciding House association may also become a difficult task as many companies may now turn out to be technically IC with more than one House. It took nearly six years for the changes in criteria to be introduced after the Sachar Committee had recommended them in 1978 and this period was enough for affecting suitable modifications in ownership and control structures by interested Houses. In many case with the increase in asset limit, the scope and in turn the desire for such readjustments would also increase. Necessity to continue to operate in and to enter into fresh areas which are outside the Appendix I industries will force the Houses to devise new methods to overcome the MRTP legislation.

There is a need for periodic studies to keep track of the trends in economic concentration. From this point of view also efforts at keeping track of the composition of industrial houses,[82] not necessarily from the point of registrations under MRTP Act, are necessary. Such studies would be useful in evaluating the contribution of the industrial policies in promoting new entrepreneurs. This information would also be a vital and necessary input in efforts at controlling product monopolies.

Looking from a different angle, rectification of a few important lacunae in the functioning of the Act which would have paved the way for realisation of its objectives, was not attempted by the 1984 amendment. For instance, the government still holds the option whether to refer the proposals of individual companies to the Commission or not. Similarly, appointing the staff of the Commission, though in consultation with the latter, continues to be its prerogative. How these factors have been affecting the working of the Commission and the administration of the Act are too well-known to be repeated here. Thus whatever may be the ultimate coverage of the Act one cannot expect much from the point of achieving the objective of prevention of concentration of economic power to the common detriment. With the donations to political parties by the corporate sector now being legalised, the chances of abuse of economic power by big business have become more pronounced.[83] Giving the MRTP Commission its due place would be a step in the right direction which would also save the government from avoidable criticism. It would be in the fitness of things if such changes are brought in along with the asset limit increase.

## Notes

[The author is grateful to S K Goyal for his encouragement and useful comments. Thanks are also due to all his colleagues in the Corporate Studies Group and to Nagesh Kumar and Michael Howard for the interest shown and helpful suggestions given. However, the responsibility for the views expressed lies entirely with the author.]

1 The Draft Bill on Monopolies and Restrictive Trade Practices presented by the Monopolies Inquiry Commission (MIC) in its report became the basis for the Act. However, the Act and the recommendations of the MIC differ in some respects. While the Commission envisaged control over dominant undertakings, the Act provided for control of large sized undertakings and industrial Houses also. The ILPIC studied the composition of 73 large industrial Houses and termed 20 of them whose assets for 1964 exceeded Rs 35 crore as Larger Industrial Houses (LIHs). For the Committee the guiding principle was that the "House should include those business concerns over which a common authority holds sway" (p 74). One of the principal criteria adopted for identifying a company as belonging to a House was that of the House controlling one-third effective equity. The Committee also took adequate note of special characteristics like persons closely associated with the House being on the Board of Directors, sole selling agency agreements and sharing of common facilities like office premises and telephones. One of the principal recommendations of the Committee was that LIHs and foreign concerns should concentrate "their resources on the development of complex and heavy investment industries which would mainly belong to the core sector" (p 190).

2 See for instance, Oza, A N, 'Putting Teeth into the Monopolies Act', *Economic and Political Weekly*, Special Number, July 1971; Chandra, N K, 'Monopoly Legislation and Policy in India', *EPW*, Special Number 1977, pp 1405-18; India, Ministry of Law, Justice and Company Affairs, "Report of the High-Powered Expert Committee on Companies and MRTP Acts", 1978 (also referred to as Sachar Committee after its Chairman, Justice Rajender Sachar); Goyal, S K, "Monopoly Capital and Public Policy: Business and Economic Power", Allied, 1979; Khurana, Rakesh, "Growth of Large Business: Impact of Monopolies Legislation", Wiley, 1981; Verma, D P S, 'A Decade of MRTPC', *The Economic Times* (New Delhi), April 7, 8, 9 and 10, 1981; and Paranjape, H K, 'Curbing Monopoly: Plans and Pitfalls', *Mainstream*, October 10, 17, 1981.

3 The lower limit was in fact seen as a more radical step. For instance, the 'Industrial Policy—Government Decisions', a statement issued on February 2, 1973 informs: " . . . the adoption of the lower limit of Rs 20 crore as well as the definition of inter-connected undertakings as provided in the MRTP Act, 1969 will result in a more effective control on the concentration of economic power".

4 Goyal, op cit, pp 26-27. The study cited a number of companies like Tata Industries, National Ecko, Investment Corpn of India, Indian Standard Metal—all included in Tata House by the ILPIC; and Birla Cotton Spg, Electric Construction and Equipment, Indian Rayon, Oudh Sugar and Pilani Investment Corpn—all of Birla House, which were not registered under the MRTP Act.

5 For instance, N K Sengupta finds that "the abolition of the managing agency removed the most important visible mark of inter-connection among companies". Cf Sengupta, "The Monopolies and Restrictive Trade Practices Act, 1969", Eastern Law House, 1980, p 30.

6 See Kumar, Nagesh, 'Regulating Multinational Monopolies in India', *EPW*, May 29, 1982, pp 909-917 for details.

7 The Committee's recommendations included: (i) reduction of the requirement of one-third equity for establishing inter-connection to one-fourth; (ii) introduction of the definition of 'Group'; and (iii) bringing investment companies under the definition of undertakings.

8 See Press Note of the Ministry of Industry dated March 9, 1979. Summary of the Committee's recommendations were reported in India, Ministry of Industry, "Guidelines for Industries", Part I, June 1979, p v-68.

9 See Goyal, op cit, p 6.

10 Paranjape, H K, 'The MRTP Amendment Bill: A Trojan Horse', *EPW*, April 28, 1984, p 725.

11 Federation of Indian Chambers of Commerce and Industry, "Pre-Requisites of Accelerated Industrial Growth", a report of the Ad Hoc Committee headed by Bharat Ram, January, 1985.

12 See *The Economic Times* (New Delhi), March 18, 1985 and *Business Standard* (Calcutta), dated March 28, 1985, respectively, for the manner in which these estimates were arrived at.

13 See *BS* (Calcutta), dated March 25, 1985.

14 The required market share for determining dominance was brought down from one-third to one-fourth in 1982 through an amendment to the Act.

15 These lists are available in the February 1976 (pp 53-77) and February 1977 (pp 63-84) issues of the journal.

16 See the April 1979 issue of *Company News and Notes*, (pp 87-101). The journal is hereafter referred to as *CNN*.

17 See the Reply to the Rajya Sabha Unstarred Question No 10 answered on July 25, 1983. (Reproduced in the *CNN*, Vol XXI, July 1983, pp 85-90.)

18 See the Reply to the Lok Sabha Unstarred Question No 471 given on February 2, 1984. (Reproduced in the *CNN*, Vol XXII, February 1984, pp 52-53.)

19 In the following any reference to 'Tata' or 'Birla' companies would normally mean that the respective company was identified as such by the ILPIC.

20 See India, Ministry of Law, Justice and Company Affairs, orders passed by the Central government under Sections 21, 22 and 23 of the MRTP Act, 1969, Vol I, 1982, p 570. (This publication is hereafter referred to as *MRTP Act Orders*.) The order dated May 31, 1978 states that the three companies jointly own and operate a thermal plant at Trombay and all the three companies are inter-connected with each other.

21 See the Reply to the Lok Sabha Unstarred Question No 5813 answered on April 3, 1979. (Reproduced in *CNN*, April 1979, p 70.) In addition, it can be understood from the MRTP Orders that TISCO admitted inter-connection with eight other undertakings of the Tata Group. (*MRTP Act Orders*, Vol I, p 574.) Some other references also show TISCO to have been registered under Section 26 read with Section 20a(i)/a(ii) of the MRTP Act. (*MRTP Act Orders*, Vol II, p 613, order dated December 15, 1971.)

22 Going through some of the older lists of MRTP undertakings one finds that Tata Chemicals was initially registered as a b(i) undertaking only and later it was registered under a(i) also as its assets exceeded Rs 20 crore. Further evidence to this fact also is

available in one of the orders under the MRTP Act, It was stated that the company denied its inter-connection with any other company of the Tata Group. The government felt that it was not necessary to go into the further details of inter-connection as it was already registered as a b(i) undertaking. (*MRTP Act Orders*, Vol I, p 551.) In 1977 it was stated that the company was registrable under a(i) also. (*MRTP Act Orders*, Vol I, 557, order dated May 5, 1979.)

23 This view gets confirmed by the evidence available in the *MRTP Act Orders*, Vol II, wherein it was stated that the company admitted inter-connection with two other undertakings namely Lakme Limited and International Fisheries Limited of the Tata Group (p 439, order dated May 18, 1974).

24 It was explained in the order issued in connection with the application of Associated Bearing Company for effecting substantial expansion, that the company accepted inter-connection with Skefko India Bearing Company. (See *MRTP Act Orders*, Vol I, p 26, Order dated July 24, 1974.)

25 See *MRTP Act Orders*, Vol II, p 448.

26 See India, Ministry of Law, Justice and Company Affairs, 'Report Under Section 21 (3)(b) of the Monopolies and Restrictive Trade Practices Act, 1969, in the Case of Tata Engineering and Locomotive Company Limited, Bombay', *Reports of the MRTP Commission and Orders Thereupon of the Central Government Under Section 21, 22 and 23 of the MRTP Act, 1969*, Vol II, Section 21, 1982, p 352. The report was submitted to the government in December 1971. These reports are hereafter referred to as *MRTPC Reports*.

27 In one of the replies given in the Parliament the government in fact explained that in the context of "the present industrial licensing policy and the Monopolies and Restrictive Trade Practices Act only those companies are considered as companies of the Tata Group which are registered under Section 26 of the MRTP Act as undertakings to which Section 20(a) of the Act applies, and which at the same time either (i) figured in the list of companies identified by the Industrial Licensing Policy Inquiry Committee as companies belonging to the large industrial house of Tata or are (ii) inter-connected with such companies." (See Reply Lok Sabha Unstarred Question 4817 answered on March 27, 1979—reproduced in *CNN*, March 1979, p 88.) Similar explanation was given in the case of TVS, Mahindra and Mahindra, Sarabhai, Kasturbhai Lalbhai and Birla Houses also. Further evidence in this regard is available in a study of assets, turnover and PBT of large industrial houses prepared by the Monopolies Research Unit of the Department of Company Affairs. It says that information had been compiled in respect of assets, turnover and profits of companies "as belonging to industrial houses *on the basis of inter-connection and other association authenticated by past studies by expert bodies as also similar information in respect of single large undertakings*", (emphasis added), see *CNN*, November 1978, p 1.

28 A House-wise distribution of the 76 companies registered under the MRTP Act during January 1980 to December 1981 was given in answer to the Lok Sabha Unstarred Question No 1657, answered on March 15, 1982. (Reproduced in *CNN*, Vol XX, March 1982, pp 71-72.)

29 The asset of figures are taken from the Bombay Stock Exchange Official Directory.

30 See reply to the Lok Sabha Unstarred Question No 3923 provided on March 17, 1981 for a list of pending cases of default notices with regard to registration under Section 26 of the MRTP Act as on December 31, 1980. (Reproduced in *CNN*, April 1981, pp 68-73.)

31 See Kumar, op cit, p 915 (Annexure).

32 Waldies Ltd became a subsidiary of the company during 1983-84. Earlier Gillanders held about 36 per cent of the equity capital of Waldies. We tried to find the possible inter-connection between Ogilvy Gillanders and Co Ltd and Lead Industries Group Ltd with the help of Dunn and Bradstreet, "Who Owns Whom: United Kingdom and Republic of Ireland", Vol 1 and Vol 2, 1978/79 and 1984 but were unable to find Ogilvy Gillanders or Gillanders Arbuthnot in them.

33 See the Directors' Report to the Shareholders in the Reports and Accounts of Gillanders Arbuthnot and Co Ltd for the years ended March 31, 1982 (p 9) and 1983 (p 7), respectively.

34 See also Paranjape, H K, (October 10, 1981), op cit, p 14, wherein it was observed that registrations under the Act were mainly of those companies with assets of Rs 20 crore or more and of those who were found to be clearly inter-connected with them such as subsidiaries.

35 However, an examination of the earlier lists of undertakings registered under the Act reveals that Hyderabad Asbestos was initially registered as a b(i) undertaking only (*CNN*, February 1977, p 72). The provisions of Section 20a(i) became applicable to it since May 26, 1979 (*CNN*, November, 1981, p 25, and *CNN*, October 1982, p 35).

36 See *CNN*, February 1977, p 77. It appears that the provisions of Section 20a(ii) became applicable to the company during 1979 (see *MRTP Act Orders*, Vol II, p 335, order dated September 22, 1979).

37 The fact that Zuari Agro Chemicals did not accept inter-connection with any other Birla company is explained a little later.

38 See "Report Under Section 22(3)(b) of the Monopolies and Restrictive Trade Practices Act, 1969, in the Case of Hindustan Aluminium Corporation Limited, Bombay", reproduced in *MRTPC Reports*, Vol III, p 272. The report was submitted to the government in August 1973.

39 See "Report Under Section 22(3)(b) of the Monopolies and Restrictive Trade Practices Act, 1969, in the Case of Kesoram Industries and Cotton Mills Limited, Calcutta", reproduced in *MRTPC Reports*, Vol IV, (Section 22), p 7. The report was submitted to the government in June 1973.

40 Ibid, p 122.

41 Ibid, p 8. See also the report on HINDALCO (note 38 above), p 273.

42 These companies did not register under the Act till the end of June 1984. See note 30 above.

43 See note 28 above.

44 See *CNN*, May 1980, pp 48 and 49, and *CNN*, August 1980, p 80, respectively.

45 It is not out of place to mention that Indian Rayon was shown as one of Aditya Birla's Indian companies, the others being Gwalior Rayon, HINDALCO, Eastern Spg Mills (all three shown under the Birla House under MRTP) and Hindustan Gas and Industries (de-registered under the Act in 1976). See 'The Quiet Rise of Aditya Birla', *Business India*, May 7-20, 1984, pp 52-62.

46 See Lok Sabha Unstarred Question No 2607 replied on March 9, 1982 (reproduced in *CNN*, Vol XX, 1982, pp 83-86). It was explained in the reply that these companies were de-linked from the Birla Group and were transferred to the Somany Group in 1980.

47 For further evidence in this regard see *CNN*, September 1984, pp 73-74 in respect of CIMMCO; *CNN*, September 1984, p 61 in respect of ECE; *CNN*, October 1984, p 39, in respect of Century Enka; and *CNN*, September 1984, p 67 in respect of Indian Tool Manufacturers.

48 See *CNN*, February 1984, p 28.

49 See reply to the Rajya Sabha Unstarred Question No 821 provided on March 25, 1985.

50 The companies are Indian Tool Manufacturers, Central India Machinery, Upper Ganges Sugar Mills and Oudh Sugar Mills. Their assets were Rs 23.12 crore (1982), Rs 30.19 crore (1983), Rs 21.02 crore (1982), and Rs 20.57 crore (1982) respectively. The asset figures are taken from the Bombay Stock Exchange Official Directory.

51 For instance, it was explained in 1979 while providing a comparative picture of the assets of Tata and Birla Houses, that the data about only those undertakings which were registered under Section 20 of the MRTP Act were being compiled and the assets figures of the houses would be higher if the data on companies to which default notices were issued. (See Reply to Rajya Sabha Unstarred Question No 509 given on July 16, 1979—as reported in *CNN*, July-August (combined) 1979, p 70.)

52 See Reply to the Rajya Sabha Unstarred Question No 1266, answered on December 19, 1977 (Reproduced in *CNN*, Vol XVI, February 1978, p 36).

53 For details of companies Inter-connected with Ballarpur Industries see the Report on the Company's proposal published in *MRTPC Reports*, Vol III, pp 67 and 95.

54 See the Report submitted to the government in June 1974 on the Company's proposal in *MRTPC Reports*, Vol I, pp 101-149 wherein it was reported that the company admitted IC only with only Atic Inds, Cyanamid India, Cibatul, Ameer Trading, ICI, Indian Explosives, Chemicals and Fibres, Alkali and Chemicals and Ciba of India.

55 Ibid, p 108.

56 For more details in this regard see the Commission's Report on the Company's proposal to set up a new company published in *MRTPC Reports*, Vol III, pp 1-59. The report was submitted in March 1974.

57 See *MRTPC Reports*, Vol II, p 220.

58 See the December 1978 List.

59 See the Dissenting Report of Paranjape in the combined report on the expansion proposals of Bajaj Auto and Automobile Products of India in *MRTPC Reports*, Vol I, p 164.

60 See *MRTP Act Orders*, Vol II, p 232, order dated March 2, 1979.

61 See *MRTP Act Orders*, Vol II, p 416, (order dated May 10, 1977).

62 Kumar, op cit, p 910 (Table).

63 See the Order dated March 27, 1984 issued under the MRTP Act regarding Dalmia Cement (Bharat)'s proposal (Reproduced in *CNN*, April 1984, p 37).

64 The Company Law Board's Order is reproduced in the *CNN*, February 1980, pp 39-58.

65 Kumar, op cit, pp 914-915 (Annexure).

66 See India, Law, Justice and Company Affairs, "Restrictive Trade Practices in India", Vol I, 1979, pp 261-263.

67 India, Ministry of Industry and Company Affairs, Report: 1984-85, p 24.

68 See for instance, UNCTAD, 'Control in India of Restrictive Business Practices' (A report prepared by H K Paranjape), wherein it was stated that "some of them (companies registered under the Act) applied for de-registration later when they realised that proving "inter-connexion" was not going to be easy" (p 3).

69 Information on de-registrations allowed during the periods November-December 1978 and July-September 1979 could not be obtained from the journal. The period covered otherwise is 1976 to June 1984.

70 See Cyanamid India Ltd, 'Annual Report', 1979, p 3.

71 NRSR was shown as a part of the NICCO group alongwith companies promoted by NICCO. See 'NICCO's Big Bounce Back', *Business World*, October 22-November 4, 1984, p 73.

72 Roplas India Ltd, 'Prospectus', dated April 23, 1979, p 5.

73 See Goyal, S K, K S Chalapati Rao and Nagesh Kumar, 'Small Scale Sector and Big Business', a study of the Corporate Studies Group, Indian Institute of Public Administration, 1984, (mimeo). It is also not surprising to find that Roplas along with Vickers Sperry and Mahindra Spicer (both de-registered under the Act) is being considered as a part of the 'Mahindra and Mahindra' group even after de-registration. See 'Mahindra and Mahindra: Making up for Lost Time', *BI*, March 15-28, 1982, p 47.

74 See the order dated March 5, 1982 on the Company's Proposal in *CNN*, April 1982, p 35.

75 In all 2,214 companies were sent default notices till the end of 1984, for their liability to register under Section 26 of the Act. Out of these only 642 got registered and in another 982 cases the default notices were vacated. Out of the remaining companies some had obtained stay orders from Courts. (See India, Ministry of Industry and Company Affairs, Report: 1984-85, pp 24-25). A few companies have been under default notice for a long time, but are not registered yet. See reply to the Lok Sabha Unstarred Question No 3923 provided on March 17, 1981 for cases like Ashoka Cement (Sahu Jain, December 12, 1972; *Hindustan Times* (Birla, June 18, 1974); Mohan Gold Water Breweries (Mohan Meakin, December 24, 1974); Gangeshwar (Sawhney, July 14, 1971); Tobu Enterprises (Shriram, November 6, 1974); Dalmia Dairy Inds (Dalmia J, June 25, 1975); Haldibari Jute (Soorajmul Nagarmull, April 20, 1973); and National Standard Duncan (K P Goenka, July 5, 1975). (Reproduced in *CNN*, April 1981, pp 68-73).

76 For instance, on the basis of ILPIC classification it was estimated that the assets of Birla and Tata Houses in 1976 were Rs 1,300 crore and Rs 1,100 crore against the reported assets of companies of the two Groups under the MRTP Act at only Rs 975 crore and Rs 980 crore respectively. See Goyal, S K, op cit, pp 70-71.

77 For a discussion on the implications of the changes proposed through the MRTP (Amendment) Bill 1983, see Paranjape, H K, 'The MRTP Amendment Bill: A Trojan Horse', *Economic and Political Weekly*, April 28, 1984, pp 715-729.

78 See India, Ministry of Industry and Company Affairs (Department of Company Affairs), Report: 1984-85, p 24.

79 In his speech delivered at a seminar organised by the Bengal Chamber of Commerce and Industry S M Dugar, Joint Secretary in the Department of Company Affairs said that as a result of the amendment about 1,500 more companies would get covered by the Act. (As reported in *Economic Times* (New Delhi), June 10, 1984.)

80 Paranjape (1984), op cit, p 717.

81 For the way in which inter-corporate investment are used in the control mechanism of Houses see Hazari R K, "The Structure of Corporate Private Sector", Asia, 1966 and Singhania, Vinod K, "Economic Concentration Through Inter-Corporate Investments", Himalaya, 1980.

82 The Monopolies Inquiry Commission discussed specifically the issue of political donations and observed that "big business has the power to corrupt and that the danger that the power may be extensively used is not imaginary". (See India, "Report of the Monopolies Inquiry Commission", 1965, Vol I, p 136).

83 The need to set up an agency to collect information on large industrial sector was felt by the ILPIC. Similar observations were also made by the Mahalanobis Committee and the MIC.

---

## Terpene Industries

TERPENE INDUSTRIES is diversifying into manufacture of expanded polyethylene (EP) and products thereof in technical and financial collaboration with Packaging Industries Group, USA, one of the leaders in the field commanding about a third of the entire market of this product in USA. Its main use as packaging in the form of blocking and brasing, wrapping, interleafing apart, EP also finds extensive uses in insulation, foundation pads, auto upholstry, water sports equipment and commercial floatation. EP in converted form of finished articles like pouches, bags, mailers, etc, would find extensive use as packaging material in exports as well as home consumption for sophisticated electronics items, glassware, artware, and other fragile articles, thus ensuring a good market. The project, being set up at Nandesari in Baroda district of Gujarat, is expected to go on stream by December 1985. According to Jayant Dalal, Chairman, at full capacity the project is expected to produce in a year 1,500 tonnes of EP and give a turnover of well over Rs 10 crore with profit commensurate with the operations. Terpene has already tied-up the necessary foreign currency loan of Rs 178 lakh and rupee loans and deferred credits for Rs 208 lakh. It is now issuing 8 lakh equity shares of Rs 10 each at par to existing equity shareholders of the company whose names appear on the register of members as on May 27, 1985 on a 'rights' basis in the ratio of 40 new equity shares against every 25 equity shares held. The rights issue of equity shares opened on June 10 and will close on July 15. Apart from this, the US collaborator will subscribe to equity shares of the face value of Rs 18 lakh in this joint venture. Terpene was established in 1973 in Himachal Pradesh to manufacture terpineol and other perfumery products with process know-how and technical assistance from Camphor and Allied Products. It has a capital base of Rs 50 lakh with its reserves standing at 67 lakh. It has paid dividends regularly in the last six years, the latest distribution being 15 per cent for the year ended June 1984.

# 'Resurgent Democracy' in Latin America

## Rhetoric and Reality

**Edward S Herman**

**James Petras**

*The Reagan administration's policy is operating on four tracks in Latin America.*

*In Central America where there is a mobilised population pressing for democracy and structural change, Washington has opted for the 'terror-with-demonstration elections' formula, attempting to destroy the social movements and then promote (and publicise) elections among local loyalists that will ratify the status quo.*

*The second track, used in South America, involves supporting elections where liberal politicians have gained hegemony over the mass movements and are willing to trade off soico-economic policies acceptable to the banks and armed forces for political democracy.*

*The third track may be seen in operation in Chile. There the mass movements are powerful and mobilised, as in Central America, so that the core policy is one of continued support of authoritarian rule and state terror, with a subsidiary thrust of gently urging (but not insisting upon) gradual accommodation with centre-right civilian political forces.*

*The fourth track, and the main thrust in Washington's Central American policy today, is to escalate the economic, political and military assault on Nicaragua. By neutralising US liberals and their Latin American civilian counterparts with rhetoric on 'resurgent democracy', the Reagan administration hopes to obtain a free hand in securing a military victory against this dangerously vital example of soical and economic (as well as political) democracy in Central America.*

IN recent months Reagan administration officials and the US press have spoken with increasing frequency and enthusiasm about the 'resurgence of democracy' in Latin America. According to Secretary of State George Shultz, we have been witnessing "more people voting in more elections in more countries than ever before in the history of this hemisphere". Alan Riding, writing in the *New York Times* of November 11, 1984, expressed the new vision under the byline: "A Latin Spring: Democracy in Flower". This spate of publicity has had several notable features. One is its excellent fit to the public relations requirements of the Reagan administration, which has urgently sought means of counteracting the widespread negative responses to its Central American policies. The administration itself has sponsored elections in delicate situations (El Salvador, Grenada, Guatemala) as legitimising projects, and it has asserted its devotion to democracy as an important reason for its anti-Sandinista policies.

The administration suffered setbacks in the Nicaraguan election, the Sandinista acceptance of the Contadora proposals (which required an administration rebuff to the Contadora countries and process), and the World Court's decision on the mining of Nicaraguan harbours (which necessitated a costly rejection of World Court legitimacy). It is therefore very useful to the administration to have the press join with it in celebrating a flowering of democracy in our backyard during the Reagan term, even suggesting (in the words of Alan Riding) that "given the United States' enormous weight in the area, the administration's public preference for democracy proved influential". By inference, given the general resurgence of democracy under the Reagan administration's leadership, any small failings—such as forcefully overthrowing the governments of one or two small backyard defectors from 'democracy'—can surely be overlooked.

A second relevant characteristic of the new publicity is its superficiality and neglect of context. These are all in the same direction, exaggerating the scope and substance of the changes, playing down the important exceptions, and misrepresenting the administration's role in the transformations. The news reports in question are all breezily optimistic: the democratic 'contagion' is spreading, and we may expect that trend to continue into the indefinite future. The word 'democracy' is used loosely, and is assumed to prevail if the formal machinery of elections is put in place and civilians are allowed to occupy high office. There are no detailed analyses of the economic and political conditions that underly the military retreat, nor of the extent to which the military establishments may be maintaining effective power by retaining their prerogatives of authority in 'security' matters and their control of key instrumentalities of the state. Finally, no distinction is made between nearby Central America, where political conditions have been steadily deteriorating under active US intervention, and South America, where some kind of resurgence may really be occurring.

What follows is a discussion and analysis of the roots, scope, and future of resurgent democracy in Latin America.

### ROOTS OF RESURGENT DEMOCRACY: REAGANISM OR ECONOMIC FAILURE?

In the beginning, the Reagan administration openly proclaimed its support for friendly ('non-totalitarian') authoritarian military dictatorships. Now it claims to have fathered the upsurge of democratic regimes. What has happened in the interim? From whence come these born again democrats? Jeane Kirkpatrick is already insisting that she was 'misunderstood', her position distorted. She too is strong for Brazilian democracy. The fact is that the resurgence of democracy in South America took the Reaganites quite by surprise and has turned out of office some of their closest and most reliable allies. They are making the best of a bad situation.

It should be noted that the return to civilian rule is taking place in states which had abandoned democratic institutions earlier with US assistance and approval. The overthrow of the Goulart government of Brazil was greeted enthusiastically in Washington, as was the military coup in Chile. The satisfaction of the US establishment with the military regime in Argentina is best captured in David Rockefeller's pronouncement that that country finally has a government that "understands the private enterprise system". This approval of the 'resurgent authoritarianism' of the 1960s and 1970s is also attested to by the enormous flow of credit, aid, and investment which the United States lavished on the military regimes during their tenure of power. These regimes all put into place an economic model well geared to serve the interests of a small strata of local business and foreign capital. The army had the responsibility of keeping the masses disorganised by terror, thus assuring low wages and a no strike environment. The military regimes provided subsidies to business, sold off public assets to the private sector at favourable prices, and promised foreign lenders that interest payments would be met. The suspension of parliamentary government assured the banking and multinational corporate community that unruly legislatures would not interfere with the freedom of business.

This system of 'supply side economics with machine guns' did not work in Latin America even on its own terms. Even before the 1980s collapse, Argentinian, Chilean and Uruguayan rates of savings and investment never reached their pre-coup averages. Foreign capital failed to rush in to invest in industry, instead confining itself largely to finance, trade, and agri-business. All three of these countries suffered from sharply increased concentration of ownership and control, denationalisation, and economic stagnation, among other problems. Only in Brazil did savings and investment rates eventually moderately overtake those of the years before the military takeover. For the entire period of military rule in Brazil upto the 1980s collapse, however, the rates of growth of the gross domestic product (GDP) were not superior to those of the preceding years of non-military rule. The rapid growth during the 'miracle years' of 1968-74 was fuelled by massive foreign credits, and the miracle terminated with a whimper, ending up in default, increased dependence, and with none of the country's basic problems yet addressed.

The oil price increases of the 1970s were devastating blows to the fragile, dependent economies of Latin America, and the recession and interest rate increases of the early 1980s put the finishing touches on a system of growth which, in the end, involved borrowing to pay interest on previous borrowings. Real GDP in Latin America increased from $ 257 billion to $ 336 billion betwen 1975 and 1984, or by 31 per cent;[1] in the same period the gross external debt increased from $ 89.4 billion to $ 360.2 billion, or by 302 per cent; while net payments of interest and profits rose from $ 5.6 billion in 1975 to $ 37.3 billion in 1984, or by 566 per cent. Assuming a 9 per cent rate of interest, the interest cost on a $ 360 billion debt would be $ 32.4 billion, a sizeable bite out of Latin American GDP.

The extent of the collapse and seriousness of the crisis are still not fully appreciated. The GDP of Latin America (exclusive of Cuba), which had increased by 4.8 per cent a year in 1975-78, and 6.1 per cent in 1979-80, fell to 0 per cent on average for 1981-84. Given the continuing rapid population growth, Latin American GDP per capita *fell* an average of 2.2 per cent per year in the latter period. Unemployment, already high, reached new and higher levels in the early 1980s. Despite the massive unemployment, the price level shot up from a weighted average of about 50 per cent a year in 1976-81 to 84.5 per cent in 1982, 130.8 per cent in 1983 and 175.4 per cent in 1984.

The crisis came to a head when major Latin American debtors were unable to pay interest and principal on their loans. Once the bubble broke, foreign capital flows dropped from $ 37.6 billion in 1981 to only $ 4.4 billion in 1983. As interest and profit repatriation amounted to $ 27.7 billion in 1983, there was a net capital *outflow* from Latin America totalling $ 23.3 billion.

The inability of the Latin economies to meet their foreign debt obligations, and the drying up of credit, threatened a wholesale collapse of the Latin American economies and the system of world credit. There ensued a massive patching up operation under US and IMF auspices, in which government credits were extended to the Latin debtors and the private banks were dragooned into putting up more money, and rates and terms were adjusted (mainly, stretched out) to give the debtor countries more breathing space. In their turn, however, the debtors were compelled to give policy priority to increasing their foreign exchange receipts and doing that which the creditors deemed essential to the debtors meeting their external obligations. Twelve Latin American countries signed conditionality agreements with the IMF in 1982 and 1983. These agreements required that the debtors sharply cut their social expenditures, deficits, and inflation rates, and make diligent efforts to keep wage rates and imports down and to facilitate exports.

The IMF and creditor formulas for alleviating the crisis, in short, involved placing the burden of adjustment for economic failure once again on the same victims who had borne the brunt of costs of the prior system of 'growth'. It is doubtful that this new medicine will work. The external interest drain is too vast, and it may not even shrink as a proportion of GDP given the limits on growth imposed by the IMF's deflationary policies. Whether the debtors will be able to generate the large export surpluses necessary to fund these enormous obligations is also doubtful, when we consider the instability of exchange rates and terms of trade, and the increasing protectionism in the industrialised states, many of whom also suffer from serious unemployment. But another question, too, is whether the Latin American populations will be willing to accept the hegemony of the international banking community, devote their surpluses to paying interest on debts accumulated in the National Security State years,[2] and quietly accept IMF deflationary medicine in that service.

By 1982 the US-backed military regimes that had featured export-oriented growth with open economies were effectively bankrupt. In the course of their collapse, the socio-economic position of many important groups, including industrialists, farmers, salaried professionals as well as wage workers and peasants, had been undermined, and major social movements had re-emerged demanding democracy and new economic policies. Huge demonstrations, general strikes, overwhelming support for civilian rule in public opinion polls all indicated that time was running out on the military establishments, which were politically isolated and divided.

It is in this context of failure of the US and military backed economic model that we must explain the return to civilian government. The latter was by no means a preferred option that had been sought in advance by Washington and its military allies; on the contrary, it represented a strategic retreat for both. If this is so, our focus should be on the terms of the transition and the limits imposed on the civilians by the retreating generals and Reaganites. It follows also that the conception of the resurgence as a triumph of Reaganism could hardly be farther from the truth.

## RESURGENT DEMOCRACY: AMALGAMATION OF TERRORISTS AND DEMOCRATS

In his accolades to resurgent democracy in Latin America, George Shultz and his speech writers have treated as identical very distinct sets of political experiences with totally different meanings. For Shultz, as long as elections take place in a client state, they are equated with democracy irrespective of substantive conditions that might make electoral exercises mere facades. Thus he lumps together the fairly 'open' elections in Argentina, Uruguay, Brazil, Bolivia, Peru and Ecuador with those in both the terror ridden societies of El Salvador and Guatemala and in US occupied Honduras and Grenada.

Elections are meaningful, however, only when they are associated with basic freedoms: when trade unions, peasant and co-operative associations, professional organisations, local opinion leaders, and ordinary citizens can meet, discuss, put forward candidates, and make choices without constraint and fear. Such freedoms exist in the South American countries to greater or lesser degree—they do not exist in El Salvador and Guatemala. In these 'death squad democracies' electoral counts are accompanied by civilian body counts. El Salvador lacks the most elementary freedom: the right to dissent without being assassinated. Under the two Duarte regimes and the in-between openly military governments, 50,000 Salvadoran civilians were murdered, and a large fraction of dissident trade union, university, professional and other groups was physically eliminated. The situation in Guatemala is little different: elections are being prepared there for a terrorised, atomised population, herded into strategic hamlets and killed by the army and death squads at rates that have averaged several thousand per year over the past decade. In El Salvador and Guatemala, despite the existence of mass movements of the left, no left candidates can qualify to run in elections (a point which does not interfere with US media encomiums to the quality of these elections).

The terror-cum-elections format in Central America is essentially a public relations exercise for US public and congressional consumption: to provide a rationale for pumping US aid into these states. Reagan administration efforts to amalgamate the Central American elections with those in South America is designed to ride the coat-tails of positive liberal responses to the latter, using them to provide a further electoral cover for an essentially military policy in Central America.

### RESURGENCE IN SOUTH AMERICA: PROBLEM OF MILITARY POWER

It should be obvious that elections may not involve any shift in power if the menu of candidates is limited to an official list approved by a behind-the-scenes power elite. It is also clear that power transfers may be limited or non-existent if 'deals' are made with the restricted list of eligible civilians and/or if an institutional structure of privilege and repression is maintained intact by prior agreement with the civilians who take office.

It is noteworthy that the US media do not raise such issues in reference to the resurgent democracies, but instead take the emergence of civilian rule at nominal and superficial value. It is interesting, further, to observe how this 'optimism-superficiality rule' is operative in contemplating, say Uruguay, but is not applicable to Nicaragua. In the former case, during the recent elections returning Uruguay to civilian rule, the man generally acknowledged to be the most popular political figure in the country, Wilson Ferreira Aldunate, was not allowed to run for office and was kept in jail through the election period. A second major political contender and popular candidate, General Liber Seregni, was also kept off the ballot by army fiat. The election was held under conditions negotiated with the army, whose institutional status and power remained intact and were to be adjusted, if at all, by future negotiations between the elected government and the semi-autonomous institution which monopolises the state instruments of coercion. But Uruguay is an 'approved' state, and the election winner, Julio Maria Sanguinetti, was even given the blessing of the US ambassador. Thus, despite the disqualifications of major candidates, it would follow that Uruguay represents a truly resurgent democracy. In the words of the newspaper of record, "Still, Uruguay is resuming its democratic vocation" (*New York Times*, ed, December 1, 1984).

In the case of Nicaragua, by contrast, the fact that potentially important candidates were much freer to run than in Uruguay, the equally free electoral environment, could not offset Nicaragua's disabilities. The *voluntary* refusal to run by Jose Arturo Cruz (which was almost surely preplanned to help discredit the election), and the Sandinista domination of the army, were too much. Poor Nicaragua is not part of the 'resurgence'. Again quoting the newspaper of record, "only the naive believe that Sunday's election in Nicaragua was democratic or legitimising proof of the Sandinista's popularity" (*New York Times*, ed, November 7, 1984).

The stress on the Sandinista link to the army as a point qualifying Nicaraguan democracy, and the contrasting downplaying of the role of the army in resurgent states like Uruguay, would seem wholly unjustified in light of the historical background. In Nicaragua the army was part of a broad-based movement that brought a popular government into power. Its army was not a repressive instrument of minority rule. In Uruguay and virtually all of the other countries undergoing resurgence, by contrast, the army has been an elite instrument whose prime function was to keep the masses under control. Upon taking power in Argentina, Brazil, Chile, Uruguay, and elsewhere, the armies sought to destroy popular organisations and to reduce ordinary citizens to powerless atoms. As was pointed out in Church documents produced during the 1960s and 1970s (e g, "The Cry of the People", put out by bishops of the Catholic Church in Brazil in 1973), army terror was an integral element of the workings of the 'development model' put in place throughout Latin America in those years. The number of civilian casualties from this reign of terror ran to an estimated 90,000 or more 'disappeared' alone.

The armies seizing power in the name of national security used that power to advance their own interests, just as they served to depress the condition of ordinary citizens. In Argentina, for example, military spending rose by 200 per cent between 1972 and 1980, while public spending on education and health *fell* by 50 per cent and 30 per cent respectively. By 1983 military spending in Argentina had risen to 8 per cent of GDP, as compared with 2.2-2.5 per cent under prior administrations.[3] These enlargements of military outlays have been mainly income transfers, with no proportionate spinoff in military capability. A recent analysis of Chilean military expenditures, which like Argentina's swallow in the vicinity of 7-10 per cent of GDP, notes the large fraction going to wages, pensions and other forms of remuneration rather than to the purchase and maintenance of weapons. Chile spends 60-80 per cent of its military budget on remuneration, as contrasted with 20 per cent for the British. Basic Chilean military pensions are five times those of ordinary citizens.[4]

The armies of the resurgent democracies are not only accustomed to power and privilege, with minor exceptions their officer corps are ideologically hostile to democratic rule. Thus it is extremely important that they are exiting from office with their personnel and institutional privileges largely intact. Instead for this repressive and powerful institution being dismantled, it retreats and bargains for retention of its place and power. The deals struck are not on the public record, and in some cases are still subject to further negotiation, but assurances of protection of budgets, the avoidance of 'vendettas' based on prior human rights violations, and continuing authority, at least partial, on security matters seem generally applicable.

The Argentinian experience represents at the moment the most enterprising and progressive effort to reduce military power in a resurgent state. It is also a favourable case, as the army retreated from overt rule by virtue of an overwhelming and massive refusal to heed its discredited representatives. Even in this instance, however, the army has merely retreated, and the reform efforts have been modest in scope and effect. The army retains considerable autonomy, is able to continue sporadic violent attacks on its perceived enemies, and has proven to be effectively beyond prosecution for horrendous crimes. Alfonsin's procrastination and vacillation in bringing the military officials responsible for torture and disappearances to an accounting has sorely tried the patience of an important part of his democratic constituency. The pressures have been mounting with over 50,000 Argentines marched in Buenos Aires in mid-March demanding that the military officials be brought to trial. The negotiated agreements between centrist politicians in the resurgent democracies and the armed forces put democracy under great strain. Alfonsin is being pressed to choose between human and military rights, and he is not finding it easy.

While the Alfonsin government has made a number of efforts to decentralise the military, reduce its financial independence, and reduce somewhat its funding, these have proven difficult and of uncertain effect. Alfonsin talked initially of a 20 per cent budget cut, but shortly thereafter Defence Minister Barras spoke of merely 'reallocating' military resources, and Undersecretary Cuchiara finally explained that "no spectacular savings must be expected. There will be some military cuts, but no one must think we are about to leave the nation defenceless."[5] More recently, Alfonsin has made a further attempt to slice the military budget, but a much discussed study by Paul Roger's of the Bradford University School of Peace Studies suggests that under civilian rule the country continued with an arms build-up, not only completing the replacement of lost equipment and supplies from the Falkland Islands War, but engaging in significant further modernisation and growth.[6]

Thus, while efforts are being made to curtail military privileges and power in several of the resurgent democracies, their armies remain largely intact in personnel and as institutions and power centres. In an important sense, therefore, they hold these democracies as hostages to their continued rights and adherence to sound principles. Real democratisation will require a further major erosion of military power and status. But it remains to be seen whether democracy can survive any serious threat to army or elite privilege.

### RESURGENT DEMOCRACY: ECONOMIC CONSTRAINTS

The new civilian regimes have taken office in very inauspicious economic and social circumstances. The economies which they are obliged to manage are in a shambles, with both serious inflation and mass unemployment at the same time, and an external debt burden that demands attention and continuous action. These new regimes came into power on a wave of popular support, but the economic crisis which they must confront gives them little room for manoeuvre. If, in negotiating the transition, the new civilian rulers promised faithfully to abide by all international debt agreements, in an important sense they assumed the political role of enforcers of deflationary policies. And if the new civilian leaders have also promised to respect army budgetary claims and power over security matters, they themselves have guaranteed a second level of enforcers who can prevent them from violating their commitments to creditors.

Thus, the leaders of the resurgent democracies find themselves in a contradiction. Alfonsin has promised real wage increases to his constituents, but these are not compatible with the actions required to generate adequate export surpluses to service the foreign debt. The latter call for reduced public expenditures and deficits, curtailed subsidies on consumer goods, devaluation, reduced imports, and the acceptance of substantial unemployment. Cuts in military expenditures would help, as would the collection of the estimated $ 4 billion annually lost in evaded taxes. But Alfonsin has made little headway on these fronts. He struggles hardest to keep the IMF and bankers at bay, with exceptions to the deflationary rules and stretch-outs and concessions on interest and principal obligations. The Alfonsin government has encouraged a consortium of Latin American debtors, with co-ordinated information and perhaps policies. But as long as the rules of the game are adhered to, Alfonsin must face the grim reality that interst payments on the deadweight external debt will swallow 50 per cent or more of export earnings and 6-8 per cent of GDP into the indefinite future. The policies that will allow these transfers will surely be regressive. No plausible scenarios of economic growth and interest rate movements will alleviate the situation. Real wages have already declined in the Alfonsin term, and we may expect them to decline further, barring radical change.

The optimistic tone of the commentators on resurgent democracy fails to give adequate weight to the parlous economic and social conditions faced by the new civilian rulers. Is it possible that they are 'fall guys' being allowed to take primary responsibility for built-in economic failures? The military regimes and their US partners having built up an impossibly large foreign debt, and having allowed the festering of social and economic sores while they 'developed' their own bank accounts, now move to the wings to wait. The civilian government will now impose the IMF-banker conditions on the already long-suffering populations. They will not be able to meet any popular needs and demands, barring a repudiation of the foreign debt and a basic economic transformation. Can democracy survive in such an environment? With the military machines still intact, won't the inevitable 'disorder' lead to a renewal of military rule? These are questions that are not posed by the press.

### DETERIORATING DEMOCRACIES: PERU AND BOLIVIA

To the degree that the new civilian leaders respond to the banks, military, and US officials, they are obliged to disregard popular demands. There is a real possibility that such continuities can alienate electorates and create new cycles of militancy and resurgent authoritarianism (which will then confirm the view of mindless cynics who see Latin America in perpetual cycles of freedom and dictatorship). Ample evidence for these concerns is found in the experiences of the early cases of democratisation.

Peru and Bolivia are two of the 'oldest' of the recently democratised countries. Presidents Siles Suazo and Belaunde Terry took power in Bolivia and Peru under conditions similar to those facing the later democratisers in the region: stagnant economies, high rates of inflation, spiralling debts and interest obligations, and the military institutions intact.

In Peru, Belaunde's accession was accompanied by the government's agreement to meet its financial obligations to its international creditors, accpetance of IMF financial and economic prescriptions, and increased military spending as an accommodation to the outgoing military regime. A policy of economic liberalisation was adopted, premised on the belief that free trade would stimulate export-led growth. Large-scale overseas borrowing, greater incentives to foreign investors, and the denationalisation of local state enterprises, were also parts of the banker-IMF orthodoxy put in place by the new civilian regime.

These policies, combined with the recessionary and high interest rate conditions of the Reagan era, produced the worst socio-economic crisis of the century in Peru. GDP growth came to a halt in 1982, fell by 11 per cent in 1983, and then made a modest (2.3 per cent) recovery in 1984. Per capita income fell by 13.3 per cent between 1981 and 1984. Manufacturing output declined by almost 20 per cent during the first three years of the Belaunde term. The ratio of external interest payments to exports rose from 21.8 per cent in 1981 to 35.5 per cent in 1984. Unemployment and underemployment reached a staggering 63 per cent of the economically active population in 1983. Far and away the most important occupation of the population of Lima is street vending. Inflation rose from 73 per cent in 1981 to 106 per cent in 1984. Real wages of the shrinking number of employed declined steadily in this period.

Failing entirely to cope with this severe economic crisis, the governing centre-right Popular Action Party has plummeted to third place among the major parties. Deep polarities are emerging: in the interior, Sendero Luminoso, the 'Maoist' guerrila group has gained considerable support, particularly in Ayacucho, and appears to be spreading to other provincial areas. On the other hand, the military has taken over *de facto* control of the areas contested with the guerrilas. Military rule has been accompanied by widespread terror, generating the worst Peruvian human rights abuses in this century (over 4,000 killed or disappeared over the past three years and many more victims of army torture). The free market economic policies and Belaunde's decision to funnel major resources to the overseas banks has surely contributed a great deal to the remilitarisation of Peru. While the major political damage has been incurred by Belaunde's party and regime, there is little doubt that the democratic process in Peru has also suffered.

It is likely that elections will take place this fall in Peru—the two leading candidates are from the socialist left (Barrantes) and the centre-left social democrats APRA (Garcia). But given the enlarged role of the military in Peruvian affairs, and the economic crisis that the Belaunde regime has greatly exacerbated, it will be difficult for any new government to attempt to alleviate mass unemployment and poverty without facing serious threats from the banks, the military, and their US backers.

In Bolivia a similar pattern has emerged. The democratic regime of Siles Suazo initially attempted to honour past debts and abide by IMF formulas prescribing salary freezes, public sector austerity, and a lessening of state controls. The consequences were disastrous. Between 1981 and 1984, GDP fell by 16 per cent—a staggering 24.6 per cent decline on a per capita basis. Export earnings fell from about $ one billion in 1980 to $ 700 million in 1984. With the foreign debt steadily rising, the ratio of debt service to exports reached 57 per cent in 1984. Inflation, which had been 25 per cent in 1981 reached 328 per cent in 1983, soared to 2,177 per cent in 1984, and is over 3,000 per cent in 1985. Bolivia's interest obligations on its foreign debt now amount to about $ 400 million a year. Its export-oriented growth has also elevated its bills for freight and insurance, adding another $ 200 million per year to the Bolivian balance of payments deficit. These sums, if invested in productive activities, might well have made a difference in turning the economy around.

Through massive and sustained strikes, the Bolivian labour movement forced Siles to place a temporary moratorium on debt payments in the Spring of 1984 and to ease up on the IMF austerity programme. Economic conditions have not improved since then, and budget deficits and inflation are wildly out of control. Brutal impoverishment—wages of employed miners are under $ 60 a month—provoked a two-week general strike in early March 1985 that shut down the economy. Siles responded by calling out the armed forces to break the strike. Once again Bolivia is polarised between a radical democratic socialist movement and a regime relying heavily on military repression. The environment of uncertainty, conflict and economic deterioration has been a propitious one for military intrigues from the narco-milicos (the various factions of the military command who deal in drugs, and right-wing politics). Ironically also, the current stalemate has aided a new bid for power by ex-dictator Hugo Banzer, under whose rule the cocaine mafia was institutionalised in Bolivia and the bulk of the country's $ 4.5 billion debt was incurred. Banzer, friend and protector of Klaus Barbie, and a major human rights violator, was an invited guest at the Republican national convention in Dallas, Texas.

However beneficient the intentions of the democratic regimes in Bolivia and Peru, by assuming past debts and working within orthodox policy constraints they have been unable to stem the tide of deepening economic crisis. The result has been that democratic institutions have lost their appeal to many people, as they have been increasingly associated with ineffective and retrograde policies. In the case of Peru, the socio-economic and human rights situation is decidedly worse under the democratic civilian regime than it was during the previous military regime, particularly the 'first phase' (1968-74)—the Velasco military government.

The negative experiences of the older redemocratised countries supports the view that the political-economic constraints accepted by the newly elected regimes allow them few opportunities for consolidating a democratic consensus. Debt moratoria and democratic restructuring of the armed forces are necessary accompaniments to political change if democracy is going to be given a chance to succeed.

## AUTHORITARIAN TRENDS ELSEWHERE IN LATIN AMERICA

Apart from Peru and Bolivia, similar processes of erosion are underway in the Dominican Republic and Jamaica. In both countries loan conditions imposed by overseas bankers set in motion mass riots and protests that left 50 dead in the Dominican Republic and scores injured and arrested in Jamaica. Neither the Caribbean Basis Initiative nor free market policies have made a dent in the 30 per cent or more unemployment rates on the islands, nor have they prevented a sharp decline in living standards. In both the Dominican Republic and Jamaica, massive popular disillusionment has elevated the status of the armed forces and shifted the balance of support for the civilian governments away from the public and toward the military.

The Grenadian election organised under US sponsorship served the need for external legitimation on the part of the occupying forces. The military invasion and subsequent training of local gendarmerie augurs ill for any effort to revive popular social movements. In Central America proper, Reagan administration activism seems to work consistently toward the enhancement of military power, the erosion of democratic institutions, and a drift toward authoritarian rule. Costa Rica's debt and dependence on US aid and loans have been used as a lever to prod that country into polarising economic policies, militarisation, and political-diplomatic involvement as an instrument of a war policy against Nicaragua. Honduras has been effectively occupied by the United States and made a front line surrogate aggressor. In the process, economic, political and human rights conditions have deteriorated steadily over the past two years. Heightened economic dependency has also pushed Panama into a closer embrace with the Reagan administration, with predictable results: rule by a former vice-president of the World Bank, who serves as an army surrogate, with the army serving in its turn as a Reagan administration surrogate and helping to ensure that the Contadora peace process will always be aborted. El Salvador and Guatemala are the 'death squad democracies', deeply prized and aided by the Reagan team as far as Congress and the public will permit. The most democratic regime in Central America, Nicaragua, is of course the prime object of fear, loathing and destabilisation activity by the Reagan administration.

While the Reaganites have been vociferous critics of what they claim are Nicaragua's electoral deficiencies, the refusal of Chile's dictator to hold elections has been met with a tolerant understanding. Washington's attitude toward Pinochet is revealing evidence of the non-(or negative) relationship between the Reagan policies and the resurgence of democracy in Latin America. The Pinochet regime is a focal point of *resistance* to the resurgence, and the Reagan administration has never ended its unconditional support for this especially brutal version of authoritarianism. The Reaganites still *prefer* viable authoritarian regimes to genuinely democratic governments. In Chile, moreover, the social movements seeking Pincochet's overthrow favour basic changes in socio-economic structures and civilian-military relations. Unlike their counterparts in other countries, these social movements are calling for democracy without military vetoes and compromises with the IMF. This has placed Washington in a dilemma. For Washington to side with Pinochet risks isolation with a dictatorship rapidly losing even elite support. To pressure Pinochet to lift the state of siege and to openly negotiate with the centre-right risks weakening his regime and deepening the influence of the threatening democratic movements. Washington has solved the problem, as it has in the cases of South Africa, South Korea and numerous other friendly authoritarian regimes, by means of 'quiet diplomacy'; that is, gently urging nominal or modest reforms while supporting the authoritarian rulers in all essentials. A recent visit of Langhorne Motley to Chile reportedly left Pinochet "purring with satisfaction".[7] Motley expressed confidence that the government of Chile was in good hands, urged the opposition to accept Pinochet's timetable of an election for 1989 (with all 'Marxist parties' excluded), and objected to any street demonstrations and mass mobilisations as playing into Communist hands.

## CONCLUSION

It is clear that Washington's policy is operating on four tracks in Latin America. In Central America where there is a mobilised population pressing for democracy and structural change, Washington has opted for the 'terror-with-demonstration elections' formula, attempting to destroy the social movements and then promote (and publicise) elections among local loyalists that will ratify the *status quo*. The second track, used in South America, involves supporting elections where liberal politicians have gained hegemony over the mass movements and are willing to trade off socio-economic policies acceptable to the banks and armed forces for political democracy. The third track may be seen in operation in Chile. There the mass movements are powerful and mobilised, as in Central America, so that the core policy is one of continued support of authoritarian rule and state terror, with a subsidiary thrust of gently urging (but not insisting upon) gradual accommodation with centre-right civilian political forces. The fourth track, and the main thrust in Washington's Central American policy today, is to escalate the economic, political, and military assault on Nicaragua. By neutralising US liberals and their Latin American civilian counterparts with rhetoric on 'resurgent democracy', the Reagan administration hopes to obtain a free hand in securing a military victory against this dangerously vital example of social and economic (as well as political) democracy in Central America.

Washington's multi-track policy combines support for death squad democracy, constrained democracy, and dictatorship: there is still a substantial road ahead before we can speak of an authentic and consequential 'resurgent democracy'. And it will develop in spite of, not because of, the policies emanating from Washington.

### Notes

1 These dollar figures are expressed in 1970 prices. This data and those which follow are taken from 'Preliminary Overview of the Latin American Economy During 1984', *CEPAL*, January 1985.

2 Dagnino Pastore, an Argentine economist and former minister of finance, has claimed that "the asset counterpart of the increased liabilities [built up during the military years] have not added significantly to the capacity of the country to generate foreign exchange". According to Pastore, the three most important uses of the borrowings, by order of importance, were: capital flight, foreign tourism, and the purchase of non-traditional imports. Jose M Dagnino Pastore, 'An Anti-Inflationary Experiment, Argentina, 1979-81', in "Symposium on Liberalisation and Stabilisation: Recent Experience in the Southern Cone", Washington, DC: World Bank, May 20-21, 1982, mimeo, pp 14-15.

3 Looting was also common by the Argentinian military. *Latin America Regional Reports* noted ironically that "it is evidence of the success of Videla's administration that most of his former aides are now millionaires", 'Report on the Southern Cone', November 13, 1981.

4 'Chile's Bloated Defence Spending', *Latin America Regional Reports*, Southern Cone, October 12, 1984.

5 *Latin America Regional Reports*, Southern Cone, April 13, 1984.

6 See "Rearmament Drive Nearly Completed", *Ibid*, February 1, 1985. See also "Alfonsin Purges the Army", *Ibid*, March 8, 1985.

## Pfizer

PFIZER's Chairman and Managing Director, S V Pillai, told shareholders at their annual general meeting in Bombay that the company's sales during the first five months had recorded an increase of about 14 per cent over those in the corresponding period last year. Profits had been subject to pressure due to the recent increase in input costs. He observed that while there had been a number of relaxations in specific industries, the pharmaceutical industry was still waiting for its turn. In answer to queries in Parliament, the Union Minister for Chemicals and Fertilisers had stated that the amended Drug Policy is to be announced 'soon'. Pillai hoped that based on the representations made by industry associations and individual companies, a new Drug Policy, which is progressive and growth-oriented, would be announced without any more delay.

The changing picture
Nikon

From arid ground to green acres. From a life of little hope to thriving, busy populace. The Changing Picture springs to colour from a drab canvas.

At Mahindra, we are happy to play this role of a catalyst in the development and improvement of backward areas. Kandivli or Nasik, Pimpri or Igatpuri—wherever we go, we have looked to the needs and welfare of the community. Education, housing, health-care. And even civic amenities like proper roads, drinking water, gardens, power have been our first priority.

The theme is to grow and develop together. To give back to society in no small measure, what we reap from it. This is the unwritten credo at Mahindra. A way of thinking that has become a way of life.

# INDIA'S MOST MODERN GELATINE PLANT IS DUE ON STREAM THIS MONTH

C.J. Gelatine Products Ltd. has set up India's most modern Gelatine plant, incorporating the latest technology at Mandideep. District Raisen (an industrially notified backward area in Madhya Pradesh)

The Company is promoted byShri. Santparkash Sahni and his associates. Shri Santparkash Sahni and his family members are at present engaged in the business of both hard and soft Cotton Waste, Fabric Processing and Polyester Texturising at Bombay, Delhi and Ahmedabad.

**TECHNICAL KNOW-HOW:**

The Company has acquired the assistance of G.T. Gelatine Technology Ltd. a U.K. based company specialising in the food and animal by-product industry. This Company has assisted in the installation and erection of the Machineries at the plant site and will assist in establishing Process and Quality Control norms. The Directors of the U.K. Company, who have between them over 40 years experience in the Gelatine industry, are taking a personal interest in this Indian Project.

**THE MARKET:**

The most important feature of the project is that it is being set up at a time, when two of the most important end user industries, are doubling their capacities. The Government of India's Currency paper unit has already achieved a substantial expansion, and the Hard-Shell Capsule industry is targeted to double it's capacity by 1986. Apart from these two important industries, Gelatine is extensively used in the Photographic, food, Match and other industries. From the present production of around 3000 tonnes per annum, the demand for Gelatine in 1988 is expected to be around 5,400 tonnes, on account of the expected growth likely to be achieved by the end using industries. Against this background the plant capacity is 1,500 tonnes per annum-thus the Company is confident that it's product will find ready buyers.

# Facade of Black Money

ALL government-sponsored enquiries and investigations into the problem of black money ultimately end up by making a contribution not so much to dealing with that particular problem but to buttressing the case for lowering taxes on the rich and doing away with controls and relations on private business and industry. In the process of doing precisely this yet once again, the report of the National Institute of Public Finance and Policy (NIPFP) on "Aspects of the Black Economy in India" has even chosen to ignore that the terms of reference set for the study, following the recommendation of the Estimates Committee of the Lok Sabha, had called for merely the preparation of an estimate of black money which, the Committee had felt, would enable the government to formulate more appropriate policies for dealing with the problem. In the event, NIPFP's report—judging by the summary published in the newspapers, since copies of the report are not available even three weeks after it was formally released by the Finance Minister—concerns itself only incidentally with assessing the dimensions of the black economy; its attention is firmly focused on unravelling the sources of generation of black income and wealth and, following from that, prescribing policy measures. Indeed so committed apparently are some of those responsible for the report to advocacy of these policies that, according to the published testimony of one member of the team which undertook the research on which the report is based, they have at places drawn conclusions not warranted by the findings of the research (for example, in regard to the connection between high rates of taxes or controls and black money generation) and at others made recommendations though the subjects of these recommendations had not been taken up for study at all (for example, illegal incomes generated through foreign trade in regard to which the report makes far-reaching recommendations in favour of devaluation of the rupee, relaxation of exchange controls and lowering of customs duties). None of this is really surprising, however, if it is remembered, as mentioned at the outset, what purpose the whole exercise was ultimately intended to serve.

If it is the reasons for the expansion of the black economy that the authors of the report were really concerned about, the most important by far of these was there staring them in the face all the while. To quote the summary of the report itself: " . . . deterrence against tax evasion is weak . . . the system of permanent account numbers has not been completely adopted and co-ordination of useful information collected from outside left much to be desired. Similarly the potential for detecting evasion through systematic survey had not been fully exploited and the provisions relating to acquisition of properties undervalued in transfer deeds had not achieved their purpose mainly due to the judicial interpretation . . . search and seizure operations have not been effective enough so far and corruption in tax administration especially in lower ranges was widespread. Few penalties were being imposed and even those levied were being struck down by courts applying the principle of *mens rea*. The number of prosecutions launched had been few till recently and convictions even fewer; the doctrine of *mens rea* once again was the culprit." What all this adds up to is that the cost of evading taxes has been and remains truly negligible. That being so, it should be obvious, tax evasion will continue to be a profitable proposition at almost any level of taxes, howsoever low. Clearly, then, the most important—indeed, considering the changes already made in taxation and in industrial and other controls and regulations, the only—measure that needs to be taken to check the proliferation of black money and wealth through tax evasion is to raise sharply the cost of such evasion by making tax enforcement effective and penalties and punishments sufficiently deterrent. That is not, of course, the view taken by the report on black money. It pleads for further "substantial" reductions in not only taxes on company profits and personal income and wealth but also in excise and customs duties as well as in the stamp duty on real estate transactions.

The only explanation possible is that black money is a facade; the real objectives are to secure unending reductions in taxes on the incomes and wealth of the rich as well as in the taxes and duties on goods and services of upper class consumption which will enlarge the markets for them and expand the profits to be made from investing in their production (or assembly or outright import, as the case may be). It is similarly not the, admittedly discredited, controls and regulations which are under attack, but the social objectives they were intended to secure: for example, keeping disparities of income, wealth and consumption within bounds; directing investment in the economy according to certain notions of social priorities, keeping in view the needs of the vast majority of the people; securing the essentials of life at affordable prices; and so on. It would be impolitic to say plainly that these objectives are to be jettisoned. So black money becomes a useful cover. As for anyone who seriously believes that corruption and black money can be dealt with by instituting *laissez faire*, let him take a glance at some of the free enterprise societies of South-East Asia or Latin America.

## *World Trade*

### Deepening Imbalances

**THE** balance of trade figures for May for the US, Japan and West Germany released at the end of June show deepening trade imbalances among these major industrial countries. This is bound to create further tension among them and is likely to strengthen the protectionist sentiment in the US.

The US trade deficit increased to $ 12.7 bn in May, $ 800 mn above the April figure. Following the announcement of the May trade deficit, the US Commerce Secretary said that the US must now expect a trade deficit of $ 140 to $ 150 bn for 1985 as a whole, compared to the record $ 123 bn last year.

The news has cast doubt whether the second quarter growth of the US economy will be as high as 3.1 per cent annual rate, as the flash estimate released a week earlier had suggested. The leading indicators released at the same time as the trade deficit showed only a feeble improvement for May and downward revisions for March and April. It is likely that the second quarter figure will be revised substantially downwards.

A major factor behind the surge in the May trade deficit of the US is a sharp decline in US agricultural exports by about $ 550 mn. The strength of the dollar, and the dumping of agricultural surpluses by the EEC, are hurting American agricultural exports. The US Administration sees the new round of multilateral trade negotiations which it is keenly pursuing as important for reducing protectionism in agriculture. Both EEC and Japan are highly protectionist in agriculture.

A factor that is causing considerable disquiet to the Americans is the expansion in trade deficit even though the pace of expansion in domestic demand has slowed down compared to early 1984. This suggests that the decline in US competitiveness is responsible to a greater degree for the worsening trade deficit than simple expansion in demand. The Bank for International Settlements, in its 55th Annual Report released in early June, estimated that about half of the deterioration in the US trade deficit over the past couple of years could be attributed to decline in US competitiveness.

The depreciation in the US dollar over the past 3-4 months should restore US competitiveness. However, there may be a considerable lag in improvement of the US trade balance. The improvement may also be limited in the absence of a vigorous economic expansion in the other industrial countries. The US which has benefited from the modest rise last year in Latin American imports—which suffered heavily earlier in the wake of these countries' debt servicing difficulties—might again find declining export orders, as the Latin American exports are losing momentum this year. The US Commerce Secretary's forecast of $ 140 to $ 150 bn trade deficit for the US for the year as a whole is considerably larger than the OECD forecast of $ 117½ bn released only a month earlier.

While the US trade deficit is expanding, the trade surpluses of Japan and West Germany continue to rise. Japan's trade surplus increased to $ 4.29 bn in May from $ 4.13 bn in April and $ 2.99 bn a year earlier. West Germany achieved a trade surplus of DM 7.5 bn in May compared to DM 5.5 bn in April and DM 4.8 bn in May 1984. These two countries, which enjoyed a combined trade surplus of $ 67 bn last year are set to have an even larger trade surplus this year. This is bound to increase pressure on them to reflate their economies. There had already been calls on the West German government to accelerate the package of tax cuts which the government was planning to implement in the next and the following year in two stages. There had been repeated calls on Japan to liberalise its trade regime.

An increase in these countries' imports, however, may not immediately get reflected in the US exports. While Japan's exports are very sensitive to growth in the US, the contrary is not equally true. A reduction in trade imbalances among these three countries would require an internationally co-ordinated expansion involving a wider number of countries

The expanding trade and current account deficit of the US implies that its demand for world savings will continue to rise. While the trade deficit would tend to undermine confidence in the strength of the dollar, the need for an inflow of savings would put pressure in the credit markets pushing up interest rates unless the surplus countries, Japan and West Germany, engineer even lower interest rates in their countries by pursuing a more accommodative monetary policy. But the fact remains that the US is caught in a peculiar situation: in the absence of vigorous economic expansion in the other industrial countries it needs a weaker dollar to improve its trade balance, but it cannot allow any marked depreciation in the value of the dollar if it has to continue attracting savings from abroad on the scale it needs.

## *Gujarat*

### Upper Castes on Offensive

IT is debatable whether the removal of Madhavsinh Solanki from the chief ministership of Gujarat would help in calming the anti-reservation agitation in the state.

The ouster of Solanki did become the principal demand of the agitating upper castes in the last couple of months. The leaders of the anti-reservation organisations of students and parents, opposition parties and the section of the local press controlled by the higher castes blamed Solanki for the continuing violence in the state. By doing so they were in a way attacking the dominant position of the backward castes in the state's politics, which Solanki epitomised as chief minister. The upper castes were probably emboldened to demand Solanki's removal by their agitational success in forcing his government to go on diluting the policy of reservation of seats for backward castes in educational institutions. Eventually on April 1, the Solanki government almost completely abandoned the new reservation policy against whose introduction on the eve of the March 1983 Assembly poll the upper caste students had originally agitated.

But the installation of Amarsinh Chaudhary as the new chief minister of the state on July 6 can hardly have appeased the upper castes. This is because Chaudhary is an adivasi and is also said to be a close associate of Solanki. The Congress(I) High Command was said to be hoping to bring peace to Gujarat by appointing the Assembly Speaker Natwarlal Shah, who belongs to the upper castes, as the new chief minister. Solanki is reported to have pursuaded the High Command to instead accept Chaudhary as his successor, on the ground that this would be in the interest of the future stability of Congress(I) rule in the state. The overwhelming majority of Congress(I) MLAs in the state are from the backward castes and scheduled castes and tribes. Solanki's strategy of uniting these numerically large sections against the upper castes, who dominated the state's politics till recently, partly enabled the Congress(I) to a spectacular win in this year's Assembly polls.

The apprehension of the upper castes, of being pushed out of the educational avenues of upward mobility due to the new reservation policy, on top of their being uprooted from offices of political power, appears to have generated the stamina to keep the agitation alive for the past five months or so. The agitation was not withdrawn, despite the new reservation policy being scrapped in April, probably because the upper castes, propelled by their successes, are keen on once and for all 'teaching' the backward and also the lower castes a good lesson. This attitude is reflected for instance in the six-week old strike of a majority of the state government employees demanding the scrapping of the system of promotions, which benefits the scheduled castes and tribes and other reserved categories.

However, the upper caste agitation has inherent weaknesses. Some amongst the upper caste students, who constitute the backbone of the anti-reservation force, would have lost a year because of the examination boycott call. Then the striking government employees must be facing growing financial strains. Probably it will be more these pressures than say the removal of Solanki that might lead the anti-reservationists to withdraw their stir. Possibly they might even come to an agreement with the government. But such agreements will at best be temporary. Electoral compulsions are likely to push the Congress(I) government into granting fresh concessions to the backward castes, which might again provoke the upper castes to take to the streets.

## *Scheduled Castes and Tribes*

### The Left's Lost Role

*A Correspondent writes:*

NOW that the CPI and the CPI(M) have arrived at some measure of agreement on "the modalities of functioning of the Central Co-ordination Committee of the two parties" and also decided "to contact other secular opposition parties with a view to developing a common movement against the economic and budgetary policies of the government", the cliche-ridden sniping by one party at the other should better be suspended. While really serious debates without the unnecessary pejoratives will have to grow, mere assertions of one party's bona fides by negating the same claim of the other will hardly convince anyone beyond the circle of the faithfuls, since neither has much to justify such claims, viewed against the background of the growing crises in the country, economic, political and social.

Moreover, the immediate joint aim of seeking to develop common movements against the economic and budgetary policies of the, presumably Union, government is undoubtedly rather limited in terms of the demands of the situation. Protection of democratic rights from attacks not only of the Union but also state governments as and when the occasion demands it is certainly not a secondary task. A case in point is provided by developments in Andhra Pradesh. Some academics including Manoranjan Mohanty of the Delhi University, were arrested and seriously beaten by the Andhra Pradesh policemen and later charged under the provisions of various criminal laws for the simple reason that they were going to Indravelli to commemorate the brutal massacre of the tribal poor there by the state police force four years ago. If the Andhra Police can harass and physically illtreat such distinguished citizens, then one can easily guess the treatment they actually mete out to the tribals and dalits, and their local organisers, particularly if they can be dubbed as naxalites, as they often are.

Without denying the wide divergences that legitimately exist between the naxalites on the one hand and the CPI and the CPI(M) on the other, the question remains if any communist party should fail to uphold the right to militant resistance against the oppressive power structure or condone the brutal suppression of such struggles by a government, even one that seeks to claim its legitimacy from its opposition to the Congress(I) regime at the Centre.

This issue has a relevance much beyond the Andhra Pradesh context, or the attitude towards the Naxalites. Unfortunately, today the CPI and the CPI(M) are both much isolated from the wide surge of mass struggles that have developed among the tribals and dalits in various parts of the country, even though the pre-split communist party was the pioneer of these movements. The Warlis in Maharashtra, Girijans in Andhra Pradesh, Tripuris in Tripura besides the dalits in Andhra Pradesh, Kerala, and so on were first politically awakened by the communists. Ajoy Ghosh had devoted much labour to preparing a study of the tribal question in Chotanagpur even when he was convalescing at Ranchi after a bout of TB. The study was published in *The Marxist Miscellany* in the mid-forties.

This divergence between the communist parties and the newly arising mass movements of the marginalised segments of population is neither unique to India nor is it due simply to communist sectarianism as is often alleged by the new militants. Their roots lie deeper as may be seen from the comments in a study of the dalit movement (Burakumin) in Japan. It is well-known that there are in Japan about three million people who are outcastes and are maltreated as in India. The publication says:

> The National Liberation League (of the Burakumin) criticised and took issue with the Communists' class struggle position as one which overlooked the special problem of the Buraku. They pointed out the differences in the historical-social foundations between the goals of the Buraku Liberation League and the Communist Party. They reiterated their focus for the realisation of human rights through the elimination of social discrimination . . .
>
> Their [Communists'] ideology is . . . exposing the oppressive capitalist forces of society.

All this further underlines the need for the communists to adopt positions of principled solidarity towards the legitimate militancy of the tribals and dalits for the protection and extension of democratic rights and thus build bridges between themselves and the newly rising segments of the poor.

## *US Multinationals*

### Still Spreading Out

**THE net investment position of the United States is believed to have turned negative sometime early in 1985 in the sense that US assets overseas fell short of foreign investments in the US. This is confirmed by figures just released by the US Commerce Department.**

While US assets overseas (including not only direct investments but also bank loans and investments in other financial instruments) grew by $ 20.67 bn to $ 914.69 bn during 1984, that was overshadowed by a much higher rise amounting to $ 98.84 bn in foreign assets in the US which totalled $ 886.45 bn at the end of 1984.

Thus at the beginning of 1985 the net investment position of the US amounted to $ 28.24 bn, as against $ 106.22 bn at the beginning of 1984. With the US trade deficit predicted to scale new heights—the deficit for 1984 was itself a record, amounting as it did to $ 123.3 bn—there can be no doubt whatsoever that the net investment position of the US had become negative by March 1985.

The interesting part, however, of this change in the net investment position of the US is that in spite of the overall position becoming negative, in regard to direct foreign investments the US position is still quite strong. As against foreign direct investments in the US of $ 159.57 bn at the end of 1984, direct US investments overseas amounted to $ 233.41 bn. So the net US direct investment position was as high as $ 73.7 bn.

No less significant is it to note in this context that direct US investments abroad recorded a higher increase (3 per cent) in 1984 than in 1983 (2 per cent), though it

lagged considerably behind the rate of increase (10 per cent) in foreign direct investments in the US. There is every possibility that with the current slowdown in the US economy and the availability of foreign funds through foreign deposits in US banks or through foreign purchases of US Treasury securities and corporate bonds—Japan has emerged as the major purchaser of US Treasury securities in recent years—the pace of US direct investments might well pick up while that of foreign direct investments in the US might slow down. So whatever the net US investment position in the coming years, it does not seem likely that the hold of US multinationals round the globe will be loosened in any measure. In fact, it might well become stronger.

## BUSINESS

# Uncertainty over Kharif Oilseeds Crop

THE vegetable oils market scene has undergone a noticeable change since about the middle of the last week of June. The market which had been displaying an easy tendency for several months has turned distinctly firm. Not only has the declining trend been halted but prices have risen by Rs 500 to Rs 1,300 a tonne in a matter of days, the rise being particularly marked in edible oils, especially groundnut oil. Only castor oil has remained subdued, reflecting extremely comfortable domestic supply—castorseed production is estimated at a record 5.5 lakh tonnes—and not-so-promising export outlook following the steep fall in castor oil prices in world markets. Castor prices have hardened over the past few days in response to export inquiries for it.

The sharp upswing in prices since the last week of June cannot be dismissed as a technical correction of the preceding steep fall from the preceding season's high levels or as a normal seasonal phenomenon—July marks the beginning of the lean season. The dramatic change in market sentiment reflects the trade's anxiety about the kharif crop because of the prolonged dry spell. After a rather early and promising start the south-west monsoon which continue to hold the key to kharif crops has been playing truant. It is not only oilseeds/oils prices which have risen quite sharply but the prices of pulses, foodgrains and cotton have also firmed up appreciably.

It is July 10 and barring a few isolated pockets here and there all the important kharif oilseeds producing tracts have received scanty rains. The rainfall map shows serious deficiency in nearly half of the meteorological divisions. Inquiries with knowledgeable sources indicate that nearly four-fifths of the total area under groundnut has still to be sown due to lack of rains and that even where sowing operations have been carried out, rains are urgently needed for the satisfactory germination of the seed. Perhaps the worst affected area is Saurashtra which normally accounts for nearly one-third of the country's total groundnut production.

If delayed sowings only meant delay in the marketing of the crop it would not matter much. But late sowing often affects crop yields which are already quite low. Indeed, crucial days lie ahead. If the weather gods do not oblige for another week, oilseeds production is likely to suffer an irreparable loss. Even the most thoughtful injection of modern inputs cannot be of much help if rainfall is inadequate or untimely.

In view of the prolonged dry spell in Saurashtra the VMA Oilseeds Research and Development Institute (VORDI) has urged growers through publicity campaign to switch over to the short duration crop which matures in 90 days. The growers in Saurashtra are known to prefer long duration varieties of groundnut because of their higher yields. The switch-over to short duration varieties could raise the problem of adequate supply of seed of desired quality.

On current reckoning the outlook for the groundnut crop which accounts for nearly 45 per cent of the total indigenous edible oil supply has become very uncertain. This is a matter of serious concern. If the south-west monsoon does not behave well, oilseeds production in 1985-86—the first year of the Seventh Plan—is certain to suffer a setback. There is little chance of the likely shortfall in groundnut production being made good through increased output of oilseeds in the rabi season. Prospects of any significant increase in the 1984-85 record mustard/rapeseed crop of 35/36 lakh tonnes cannot be rated high.

Poor south-west monsoon and the consequent setback in oilseeds production—should current fears in this regard materialise—should serve as strong reminders about the imperative need to bring more irrigated area under oilseeds which is essential for stepping up production. Increased application of costly inputs demands assured supply of water. With only 14 per cent of the total area under oilseeds enjoying irrigation facilities it would be wishful to look forward to any major and sustained increase in production unless, of course, there is a breakthrough in dry farming of which there are few indications so far. New Delhi cannot pretend it lacks resources for oilseeds development when massive sums are being spent on edible oil imports to bridge the huge gap between indigenous supply and demand.

To put the recent upsurge in vegetable oil prices in proper perspective it needs to be noted that the current prices (July 10) are substantially lower than the prices which prevailed a year ago. On the basis of spot quotations in Bombay on July 10 and a year ago, groundnut oil is down by about 16 per cent, cottonseed oil by 25.8 per cent, sesame oil by 18.4 per cent, kardi oil by 13 per cent, linseed oil by 19.3 per cent, mahuva oil by 25.6 per cent, rice bran oil by 21.4 per cent and castor oil by 35.5 per cent. Vegetable oil prices last season had been marked up to unduly high levels, record edible oil imports notwithstanding. Vegetable oil prices are certain to be moved up substantially if the monsoon fails. Quite a good deal would, however, depend on the government's policy in regard to allocation of edible oils under the public distribution system which needs to be strengthened and streamlined to mitigate the suffering of the common folk.

## *Unit Trust*

### Strictly for Tax-Payers

STATISTICAL data relating to Unit Trust of India's operations during the year ended June 1985 make really impressive reading. Aggregate sales of units under all the schemes are up over the year by 127.2 per cent from Rs 330.16 crore to Rs 750.01 crore with the number of unitholders registering an increase of 13.3 per cent from 1.5 million to 1.7 million. Gross income has risen by 77 per cent from Rs 142.54 crore to Rs 252.41 crore, investible resources by 73.6 per cent from Rs 1,261.33 crore to Rs 2,190 crore, reserves by 90.5 per cent from Rs 160.33 crore to Rs 305.42 crore, sanctions under direct financial assistance by 206.15 per cent from Rs 191.53 crore to Rs 586.37 crore and disbursements by 80.7 per cent from Rs 166.50 crore to Rs 300.87 crore. Consequent on the increase in distributable income, dividends for the ongoing schemes, payable on the increased capital base, have been further stepped up for the sixth year in a row—from 14 per cent to 14.25 per cent under the unit scheme, 1964 and from 11.5 per cent to 12 per cent under the unit-linked insurance plan, 1971.

The UTI chief, M J Pherwani, has mentioned several factors which have contributed to the Trust's impressive performance during 1984-85. These include profound change in the saving and investment habits of the people, strengthening and streamlining of the marketing infrastructure through expansion of the agency force, improvements in systems and procedures to tone up the efficiency of service to unit-holders and imaginative publicity programmes and adoption of appropriate strategies for judicious investment of funds. UTI is said to have reached "a new plateau of public acceptance and gained recognition as an important member of the financial community" and it claims to be playing "a very active and positive role in the capital market".

Having acquired command over sizeable investible resources UTI has no doubt become an important member of the financial community but its claim in regard to having reached a new plateau of public acceptance is open to question. It is extremely unlikely that UTI could have performed the way it has if it did not enjoy the various tax concessions it does. It enjoys a monopoly position in this respect. There is no getting away from the harsh fact that it is the wealth-tax payers and income-tax assessees in higher brackets who are the major beneficiaries of investment in units. Non-tax payers have little to gain from investment in units, either by way of annual return or capital appreciation. Even on the basis of the concessional prices of Rs 12.60 in July 1984, the dividend of Rs 14.25 per cent gives a yield of only 11.3 per cent. The total capital appreciation in units over a period of 21 years works out to no more than 49 per cent—the maximum repurchase price so far being Rs 13.90. An investor putting his money in bank deposit or non-convertible debentures or in equity shares of a reasonably well managed company would have fared very much better. Tax considerations apart, only those investors go in for units who are obsessed with the idea of security and are totally unaware of more profitable opportunities of investment elsewhere.

UTI was set up to mobilise the savings of the community, particularly from the small and medium groups. But its major patrons are the rich guys, persons with piles of black money, and the companies. An inquiry into units held by companies and purchases of units with cash where the amount happens to be fairly large as also the names of people receiving dividends in large amounts (UTI dividends are paid without deduction of tax) could prove to be quite revealing.

It is interesting to note that nearly 27 per cent of the gross sales amounting to Rs 750 crore are accounted for by capital gains unit scheme (Rs 203 crore). Since this scheme is designed for claiming exemption from capital gains tax, no publicity is needed to induce people to avail of this facility. If one were also to exclude sales effected at the concessional price during July—it could well be around 40 per cent of the total sales of units under the unit scheme, 1964—the additional savings mobilised during the rest of the year would work out to be rather small.

No less questionable is the UTI's claim in regard to its "very active and positive role in the capital market". It hardly does any underwriting of equity capital and purchases of equity shares of established companies from the market cannot be described as lending support to the capital market. By underwriting debentures or by subscribing to them UTI cannot claim to be making any positive contribution to the capital market. Subscriptions to debentures of reputed companies as also underwriting such debentures amount to aiding and abetting the pre-emption of financial resources by big companies. It is bad enough to permit big companies of repute to raise funds from the market by offering the maximum permissible rate of interest on debentures and much worse to allow them to retain 50 per cent of the subscriptions in excess of the notified amount.

## *Housing Finance*

### More Is Not Enough

THE Planning Commission has reportedly cleared the proposal to set up a separate bank exclusively for financing private housing, and has provided Rs 50 crore for the purpose. The Reserve Bank of India and other financial institutions are expected to provide another Rs 50 crore so that the proposed bank could start with an initial capital of Rs 100 crore.

Looking at the colossal housing problem facing the country and the meagre resources available to tackle it, the proposal should be welcomed. A study group set up by the Planning Commission has estimated the total stock of housing in 1985 at 124.9 million units—95.2 million rural and 29.7 million urban. The housing shortage at the beginning of the Seventh Plan has been estimated at 24.2 million units. The study group has also estimated that between 1985 and the year 2000, an additional housing stock of 90.8 million units would be needed to meet the requirements of increasing population, obsolescence in existing stock and the destruction of a part of the existing stocks due to natural calamities. The group has estimated the total housing stock required in 2000 at 229 million units. Thus the net addition to the existing housing stock required during the 15-year period 1985 to 2000 works out to 105 million units. While the investment needed for the period 1985 to 2000 to meet the housing needs is estimated at Rs 1,13,650 crore, in the Seventh Plan period alone (1985-90) it is estimated at Rs 33,800 crore. Three-fourths of this will have to come from the private sector.

The proportion of the public sector outlay allocated to housing has been getting progressively smaller in successive five-year plans. It declined from 34 per cent of total outlay in the First Plan to a meagre 7.5 per cent in the Seventh Plan. The housing shortage has become much more acute now than it was in the sixties. Moreover, it is the economically weaker sections of the population which has been affected most by the widening gap between supply and demand for houses, notwithstanding the supposed shift of emphasis in public sector housing in favour of these sections. Because of the population growth in urban areas, rising

POLITICAL CONFLICTS AND POWER IN AFRICA

By Dr. S.C. Saxena

Foreword by: K. Natwar Singh
1985/Pp.350/Price Deluxe Edition Rs. 200/-

This book deals with some of the major conflicts that presently afflict the continent of Africa such as the conflict in South Africa caused by the imposition of apartheid and racial discrimination by the racist minority regime, refusal of the same racist regime to vacate its illegal occupation of the former mandate territory of Namibia, the bitterly fought armed struggle now in progress under the leadership of the Polisario Front for the liberation of Western Sahara from the clutches of MOROCCO, the civil war that has been going on in CHAD almost since its independence, and the demise of democracy and re-emergence of military rule in the most populous African State, namely NIGERIA. The author, in the five chapters has made an in depth analysis of the nature of these problems, examining, at the same time, their various dimensions and implications for the continent and for the whole world. The roles played, and being played, by international and regional organisations as well as by the neighbouring states have been covered by the author with profound clarity and conviction.

In respect of at least three problems covered by the author in this book, namely APARTHEID, NAMIBIA, and WESTERN SAHARA, the author has examined the role & attitude of India also in the light of the fact that India has been in the forefront in the struggle against colonialism and racism wherever it has existed in the world.

land prices, unrelenting escalation in construction costs, house prices have skyrocketted. As observed by the task force on shelter for the urban poor and slum improvement, rising construction costs have pushed even the cheapest houses beyond the means of the economically weaker sections.

While a number of the factors mentioned above have slowed down the pace of growth of private housing, the problem of finance has been the greatest deterrent. A survey carried out by the National Institute of Public Finance and Policy revealed that 70 to 80 per cent of individual house owners have had to depend on their personal savings to build houses.

Since housing is a state subject, the Central government through its budgetary allocation can provide but a small proportion of the total investment required. Of the two housing finance corporations, the Housing and Urban Development Corporation (HUDCO) in the public sector and the Housing Development Finance Corporation (HDFC) in the private sector, only the HDFC provides loan assistance to individual house-buyers. The Life Insurance Corporation (LIC) and the appex co-operative banks also make available some funds for housing. However, all these existing institutions are not in a position to meet the ever growing requirements of housing finance.

In the context of the much larger resources needed to cater to housing needs in the Seventh Plan and beyond, the proposed bank to deal exclusively with housing finance is a welcome step. Since the Planning Commission has already cleared the proposal, the government should now follow it up by working out a proper framework for the proposed bank and give it adequate autonomy to raise resources to enable it to effectively play the role assigned to it. It also appears desirable to relax the curbs on commercial banks' lending to the housing sector. Sometime back the Union Labour Minister had indicated that the government may use provident fund collections for promoting housing projects in a big way. This proposal also needs consideration.

## LETTER TO EDITOR

# Ahmedabad Violence

THIS is in response to the letter by Nimesh Sheth and others (June 15) on my report on the violence in Gujarat.

Two major points are raised by the authors. The first relates to the reporting of the second phase of rioting that occurred in Ahmedabad between April 15 and 26 and the second to the analysis of the events and to the following issues: the nature of the anti-reservation agitation, the role of the State, the role of the police, and the role of what the authors call 'spontaneous realignment of forces taking shape during the agitation'.

It seems that the authors have made their comments without taking into account my earlier report (April 20) which not only analysed the caste alignments that led to the anti-reservation agitation but also discussed the first phase of the communal violence that took place in Ahmedabad. That was no 'armchair reporting'. What was reported was based on investigations made by a team of which I was a member. My April 20 report analyses the social forces that were and are at work in Gujarat. The second report can, therefore, be understood only in that context. It is a different matter if the authors of the letter do not agree with my report; but that does not necessarily make it misleading or formulistic.

With regard to the issues of interpretation raised by the authors, I have to state the following:

(1) Unlike the authors, I do not believe that the role of the State in the present agitation has been that of an 'equaliser'. I do not, therefore, hold a brief for the State or any of its organs—for example, the police. By increasing reservations to the backward castes, the State government, I have maintained, was making a populist gesture. What the Solanki government was attempting to do was to use the politics of caste and reservation to mobilise votes for itself. This strategy became an all-India policy for the Congress(I) when Indira Gandhi came to power. An election strategy that mobilises the poor for votes does not make the government that so comes to power a pro-poor government. I have argued that the Solanki government has always shown its upper class, and therefore upper caste, bias. When the upper castes started being mobilised through the anti-reservation agitation, the Congress(I)'s response was the product of the contradictions that it had to face between its electoral strategy and the economic interests it represented.

(2) All available independent investigations attest that the police had indeed entered houses, damaged household belongings and beaten up residents in Khadia. This behaviour can only be termed as a 'police excess'. While it is true that such excesses have been inflicted on the poor, on women and on minorities, the fact that it was also inflicted on the upper castes does not make it less of a police excess. Mentioning it as a police excess should not make a commentator a supporter of the anti-reservation agitation, as the authors imply in their letter. In fact, it is my argument that by mobilising the police which is divided on caste and political lines, the Solanki government created a situation whereby the police *vs* people conflict became possible. This made possible the continuation and the spread of the agitation and ultimately brought about a collapse of confidence in the government. Thus playing into the hands of the anti-reservationists.

(3) My report states clearly my position on the role the newspapers have played in Gujarat. On page 682, I write that "the agitation was blown out of proportion by the Gujarati newspapers which betrayed their upper caste biases". I do not therefore understand why the authors believe that I am "pouring out my heart for the newspapers". However, I do not take the position that the burning of newspaper offices by the police or other government attempts to curb press freedom are in any way justified. Any analysis of the Gujarat violence has to simultaneously criticise both the police attack on newspaper offices and the anti-reservation bias of the press.

(4) I am surprised at the authors' use of the sexist phrase 'women of easy virtue'. May I remind the authors that the present patriarchal society uses such phrases whenever atrocities on women are defended? The use of such a phrase by the authors shows a cavalier attitude towards facts.

(5) With regard to the last point, about 'spontaneous realignment of forces', I am sure readers of *EPW* would have appreciated it if the authors had given some evidence in support of this generalisation. The evidence we have collected indicates that if the Muslim shopkeepers protested against the 'bandh' by keeping their shops open they did not do so because they were supporting reservation or had feelings of solidarity with the backward and scheduled castes. As numerous interviews conducted by us indicate, they did so because the reservation issue did not concern them. While there is evidence that in some areas the Muslims tried to protect the scheduled castes and *vice versa*, in other areas the minority community and the deprived castes have been antagonists. The attack on and later burning of a backward caste Dabgar family is one such example. There are many others. I would certainly question any generalisation about alignment of forces when there is evidence of how at least one trade union organisation dealing with working women is finding that the workers are divided on communal and caste lines. If the unity among these groups had 'hardened', as the authors state, such organisations would not be facing the problems that they are facing today.

In the context of the present agitation in Gujarat it is easy to fall into the trap of an analysis that sees only two groups: reservationists and anti-reservationists, the latter comprising the upper castes and the former the deprived castes and the minorities. Reality is more subtle and does not order the alignments as one would wish to order them.

# An Editors' Guild Initiative

### Romesh Thapar

AT various retreats, here, there and everywhere, scribblers among political activists are busy drafting strategies for the new situation in order to gain relevance. The trouble with these 'documents' is that they are intended to sound impressive and sincere, but no one really bothers about implementing the sentiments embodied in them. Well, I think the time has come to make political parties realise that we are not the sheep they think we are.

In this connection, the Editors' Guild several months ago took a very solid step to concentrate political attention on two issues of considerable concern to it. First, it called on political parties to commit very specifically to the freedom of the press. And, second, it urged the political parties to make the autonomy of the electronic media a major concern, linking it to the whole question of democratic participation.

It was only during the Emergency that the public in India developed any kind of commitment to a free press or an autonomous electronic media. But the commitment was tentative, somewhat superficial and easily to be confused and blunted. This became fairly clear with the casualness of the Janata government to the question of radio and TV autonomy, and in the continued misuse of these potentially powerful establishments under the Congress(I) regimes. As for the restoration of press freedom, the politicians of various parties—Congress(I), AIADMK, National Conference and Telugu Desam—were not reluctant to move so-called press bills to curb this freedom. And now many threats exist on the statute books.

Professionally, first priority has to be given to the freedom of the press. It is central to the health of a democratic state. But we know that politicians of all colours resent sustained criticism and exposure, always seeking subtle and not-so-subtle ways of curbing the independent journalist and writer. Invariably, all manner of convenient descriptive adjectives are used to introduce the systems of caution and censorship—as if these curbs are necessary in the interests of civilised and truly democratic life.

There is little point in going over the entire episode of the Bihar Press Bill, modelled on the Tamil Nadu enactment, imitated by Orissa and played with in Kashmir and, now, Andhra Pradesh. Only the utmost vigilance, combined with disciplining action by the press, was able to curb a surreptitious encroachment of press freedom. The campaign led by the Editors' Guild and other organisations of journalists, climaxed by co-ordinated black-outs in Bihar of offending politicians and parties and a symbolic continental strike, contained many lessons. But the picture today is worse than it was in several subtle ways. The protest does not build.

Clearly, the whole developing structure of what is called 'Informatics' can only become 'responsible' in an atmosphere of freedom, with a public playing an increasing interventionary role in making clear that it disapproves of those who misuse the infrastructure. Both aspects need time to develop, but they will for ever be under threat from those who enjoy power and are corrupted by it. The Editors' Guild sought to establish the kind of guarantees that cannot be easily subverted.

In the area of radio and TV, the political and bureaucratic apparatus has employed a clever stratagem to retain control over these rapidly expanding networks. Commissions were appointed to investigate the state of the electronic media—as if we are unaware of it! These commissions indulged in the usual touring and interrogations. The massive reports which followed invariably urged autonomy, but in so complex a form that committees of bureaucrats were established to 'consider' the proposals—a phrase that implies burial! And the last commission, headed by an academic, has verbally propounded a 'revolutionary' change in programming and staffing without really tackling the central question of creativity—namely, autonomy.

All political formations are guilty of this hide-and-seek on the autonomy of the electronic media. It has, therefore, become necessary to urge that no more commissions are required, that all parties should commit to establish autonomous Boards for radio and TV and leave them free to work out the mechanics of their autonomy. This is the practice in civilised, democratic societies—and we claim to be one!

Naturally, the Editors' Guild should press forward with its campaign and achieve a working rapport with other professional organisations. This unity of purpose is most necessary, for the next step will involve the working out of sanctions against those parties which refuse to commit to these freedoms and autonomies. Before it is successful, the campaign could involve black-outs of erring parties and a refusal to participate in the programming of the controlled electronic media.

These have become critical issues for two basic reasons. First, the democratic commitments of the freedom struggle have become vague and woolly. And, second, there has been a massive expansion of government influence in the media (for example, 180 more TV transmitters!). Scientists and technologists are always enthusiastic about the installation of hardware, but they seldom turn their attention to the programming. We had better watch out, for this lapse could spell a growing fascisation. It certainly expresses itself during elections, in the interest of those who rule.

At every level, the Editors' Guild will have to sensitivise the conscience of those who guide the thought processes of millions of Indians who are critical to decision-making. It will also have to become more active in mobilising opinion against those who would misuse this freedom—the purveyors of vulgar values, particularly in our films, the exploiters of violence which can wreck our complex societies, and the bandits who are distributing hard and brutal pornography throughout the sub-continent, along national highways and rural roads as part of the so-called video revolution. The campaigning, alas, is in fits and starts.

The misuse of freedom can shatter the moral balance of societies, but we have to explain patiently that a denial of freedom has no moral objective whatsoever. It is a politician's ploy for undisputed power. Indeed, so many of the problems which are rocking the stability of this sub-continent could have been blunted if brutally frank discussions had taken place on the electronic media. We avoid these exchanges, narrow our perspectives and understandings, and in the process feed dangerous distortions and polarisations.

The power of the electronic media is now a major factor in conditioning attitudes. It can no longer be dismissed as a vehicle for middle class titillation. The sooner our political parties understand this new orientation in communications, the better for our democratic health.

*July 5.*

## Money Opportunities

MONEY OPPORTUNITIES, a new weekly publication catering to the investing public, was recently launched in Bombay by Ross Murarka Finance (RMF). It will feature authentic and well researched news on corporate performance, apart from dispensing share tips and other industry analyses to help investors select potential 'Blue Chip' scrips for high return and profitable investments. According to Ross Deas, Managing Director of RMF, each issue would contain timely, comprehensive and in-depth coverage of companies recommended for investment alongwith reasons for investments, suggested purchase price, future profits and share price projections apart from timely advice on when and at what price to sell shares which are no longer profitable. Each copy is priced at Re one.

# Deaths in Police Custody

### A G Noorani

THE Law Commission's Working Paper on "injuries in police custody" deserves careful consideration. The disease is an old one but it has recently acquired an aggravated form. Rapes and murders in police custody do receive notice in the papers but public insensitivity has grown with the aggravation.

The Working Paper was triggered off by the observations of the Supreme Court on January 22, 1985, in the State of Uttar Pradesh *versus* Ram Sagar Yadav and others. Ram Sagar Yadav was the Station House Officer of the Hussainganj police station in Fatehpur district. Three others were constables. On the morning of August 29, 1969—note, 1969—two of these constables went to Haibatpur and arrested Brijlal and brought him to the police station at about 10 a m. At about 9 p m, that is just eleven hours later, he was dead due to the injuries inflicted on him in police custody.

The prosecution alleged that the accused policemen wished to extract a bribe from Brijlal, in connection with a complaint filed against the deceased for cattle tresspass, on the promise of a hush-up. He paid up Rs 100 but refused to pay another Rs 200 to one of the constables. Instead, he filed a complaint on August 7, 1969 against that constable before the SP. The SP sent it to the SHO, Ram Sagar Yadav, for inquiry and report. The SHO was incensed by Brijlal's audacity in making such a complaint. So he sent two other constables to bring Brijlal to the police station to teach him a proper lesson. The Sessions Judge convicted the SHO and the constable, alleged to have taken the bribe, under Section 304, Part 2 of the IPC and sentenced them to rigorous imprisonment for seven years. The SHO was convicted also under Section 220 of the IPC for keeping a person in confinement corruptly and sentenced him to RI for five years. The two constables who had arrested the deceased were committed under Section 304, Part 2 and sentenced to three years' RI.

On appeal a single Judge of the Allahabad High Court set aside the convictions. The Supreme Court allowed the State of UP's appeal and affirmed the convictions and sentences. The Supreme Court criticised the High Court's judgment and its reasoning.

The prosecution evidence was overwhelming. Already by noon when Brijlal was produced before R C Nigam, the Additional District Magistrate, he had been so badly beaten that he could barely speak. Nigam made a note of this on the police remand application, signed it himself and obtained the deceased's thumb impression. The statement was clear—"the darogah of Hussainganj and the constables had beaten him very badly". It was further supported by the evidence of a police constable who took Brijlal to the Magistrate.

The court complimented the Magistrate for making the note in contrast to its pointed criticism of the High Court. Two other important witnesses supported the prosecution case—the jailor and the jail doctor, both independent persons. Brijlal made a dying declaration to the doctor about the police beating.

Death due to beating in police custody was thus proved. The question was *who* were the policemen responsible. The SHO, Ram Sagar Yadav, was specifically mentioned by Brijlal. The identity of the constable who had taken the bribe and the ones who had arrested him was also established.

The Supreme Court expressed regret that the Sessions Judge convicted the respondents under S 304, for culpable homicide not amounting to murder, and not under S 302 for murder itself. One must, in turn, express regret that the Supreme Court thought it fit not to "pursue that matter any further since the state did not file an appeal against the judgment of the Sessions Judge" on that ground and the prosecution had not lead evidence through the medical officer "in order to bring out the true nature of the injuries suffered by Brijlal". Pray, was all this necessary once the entire record was before the court?

The Supreme Court recommended that the law be amended "appropriately so that policemen who commit atrocities on persons who are in their custody are not allowed to escape by reason of paucity or absence of evidence". Policemen are bound by ties of brotherhood and do not depose against one another. "The law as to the burden of proof in such cases may be re-examined . . ."

The Law Commission's Working Paper comments: "The best course would be to give power to the court to draw a presumption where bodily injuries (fatal or otherwise) are caused to a person while he is in the custody of the police. The court may be given a discretion to presume that the injuries were caused by the police officer having custody of the person during the relevant period. The vesting of such a power in the court would be justified because, as regards a person in police custody, it is unlikely that any one else would have the opportunity of inflicting injuries. The presumption should, of course, be discretionary and rebuttable so that extraordinary situations can be taken care of. The formula 'may presume' would be appropriate. At the same time, it may be desirable to furnish to the court some guidelines in administering such a provision, which will be a qualification to the general rule of burden of proof."

The Working Paper suggests insertion of a new provision—Section 114B—in the Evidence Act, on the following lines:

> (1) In a prosecution [of a police officer] for an offence constituted by an act alleged to have caused bodily injury to a person, if there is evidence that the injury was caused during a period when that person was in the custody of the police, the court may presume that the injury was caused by the police officer having custody of that person during that period.
>
> (2) The court, in deciding whether or not it should draw a presumption under subsection (1), shall have regard to all the relevant circumstances, including in particular, (a) the period of custody, (b) any statement made by the victim as to how the injuries were received, being a statement admissible in evidence, (c) the evidence of any medical practitioner who might have examined the victim, and (d) evidence of any magistrate who might have recorded the victim's statement or attempted to record it.

There is, however, one *fatal* flaw in this scheme for bringing delinquent policemen to book. Their protectors are not only fellow-policemen but very often politicians in power. The provision in the Criminal Procedure Code for the state government's prior sanction to the prosecution of public servants is a blot on the statute book. In this case the Government of UP acted honourably. But read the report in the *Indian Express* of July 10 about the obstruction which even the CBI faces from the Rajasthan government in the Deeg case. These provisions must go.

## Tata Fertilisers

TATA FERTILISERS has contradicted rumours that the company's shares are being offered for private placement and that in some unofficial and unauthorised deals, are even attracting a premium. With a view to protecting interests of genuine investors, the management has categorically stated that all these rumours are totally unfounded. Tata Fertilisers is at present a 100 per cent subsidiary of Tata Chemicals and will be spun off as a separate public limited company at an appropriate time in future after all the necessary approvals have been obtained.

# Beyond Textiles

### Hansavivek

*RELIANCE TEXTILE INDUSTRIES* continues to forge ahead on the path of diversification of its activities. It has already secured government clearances for the polyester staple fibre (PSF), purified terephthalic acid (PTA), mono ethylene glycol (MEG) and linear alkyl benzene (LAB) projects. With the available expertise in terms of manpower, the potential of the company has been greatly improved to surpass its own track record in speedily implementing various projects involving an outlay of Rs 674 crore. The company has already negotiated foreign exchange requirements equivalent to Rs 252 crore. It has also reinforced its financial strength by a scheme of extinguishment of debentures of series I, II, III and IV. Of the total outstanding debt of Rs 73.50 crore in the form of these debentures, a sum of Rs 71.63 crore has been extinguished and equity shares in the ratio of 1.4 for every Rs 100 outstanding have been issued in terms of permission received from the Controller of Capital Issues. In order to facilitate the process, the company embarked on an innovative scheme by opening 50 centres all over the country for the purpose of receiving extinguishment letters as well as for the delivery of share/debenture certificates and for rendering prompt and personalised services. The shareholders and debenture-holders greatly lauded the company's efforts for alleviating their difficulties. The company issued new 'E' series non-convertible debentures of Rs 150 each of the aggregate face value of Rs 80 crore which was fully subscribed. The company has announced issue of further non-convertible secured debentures of Rs 100 each of the aggregate face value of Rs 100 crore to finance, *inter alia*, projects relating to polyester yarn/fibre. The formal take-over of the assets of the Chemicals and Plastics division of Union Carbide India at Chembur in Bombay is expected to be completed in the coming weeks. The company proposes to modernise this unit with the latest technology to attain optimum results in terms of turnover and profitability.

During 1984, the company has performed exceedingly well with increases in sales, profits as well as margins. It has earned a gross profit of Rs 95.27 crore against Rs 69.90 crore in the previous year following a turnover of Rs 604.27 crore against Rs 502.83 crore. Net profit has expanded from Rs 38.52 crore to Rs 61.10 crore, even though depreciation has taken away more. As before, there is no tax liability. Equity dividend has been stepped up by 5 points to 40 per cent on the increased capital and is still covered 3.90 times by earnings as against 4.01 times previously. As at the year end, reserves stood at Rs 194.41 crore against a share capital of Rs 51.98 crore. The company has applied to the Controller of Capital Issues for enhancing the rate of dividend on the preference shares from 13.5 per cent to 15 per cent per annum with effect from May 16, 1985 and would pay the difference in dividend amounting to over Rs 5 lakh on receipt of the official permission. The company completed during the year the modernisation and replacement programmes relating to preparatory, weaving and processing sections. The new looms installed, *viz*, water jet and projectile belong to the latest technology which will enable the company to produce improved quality fabrics. At Patalganga an additional spinning line has been commisssioned for production of finer denier yarn. The current year's working should reflect the bene-

fits of modernisation and replacement scheme carried out at Ahmedabad and Patalganga. In view of the widely diversified activities of the company, its name is proposed to be changed to 'Reliance Industries'.

*BAYER (INDIA)*'s management has changed hands. B M Ghia, Jaykrishna Harivallabhdas, D B Ghia, S N Desai, F A Mehta and Rudolf Kopf resigned from the board. R P Goenka, M R Chhabria and D C Shroff were appointed as new directors on the company's board. B M Ghia also resigned as Chairman of the company. The reconstituted board elected Goenka as the new Chairman. The board has also appointed Wilfried Keller as non-retiring Technical Director in whole-time employment of the company from September 1, 1984. Harold Lange, Managing Director, has submitted his resignation from the board and from his office of Managing Directorship to take up a new assignment with the collaborator firm, Bayer of West Germany. The board has decided, after discussions with the collaborator, to relieve Lange with effect from July 31, 1985 and appoint in his place Werner Bahl as Managing Director from August 1, 1985.

During 1984, the company earned a higher gross profit of Rs 9.40 crore against Rs 7.58 crore in the previous year following increase in turnover from Rs 68.98 crore to Rs 76.96 crore. These figures show an enhancement of profit margins. After necessary provisions, the net profit amounted to Rs 3.43 crore (Rs 2.05 crore) and the unchanged 18 per cent distribution was covered 2.35 times against 1.40 times previously. These results have been obtained despite cost escalation, particularly in raw materials (+ 24 per cent), utilities (+ 17 per cent) and in personnel expenses (+ 10 per cent). These escalations could only be partly recovered from the market by increased selling prices. Better utilisation of capacities, overhead cost control and improved product-mix, however, contributed towards the increase of pre-tax earnings, and a higher investment in production plants helped to reduce tax liability. The pharmaceutical division registered a modest growth of five per cent in sales because of the government's continued restrictive policy for the pharmaceutical industry combined with inordinate delays in price revision and matters of licensing. The directors observe that the much awaited new Drug Policy did not see the light of the day. The company had applied for recognition of installed capacity in 1980 and for re-endorsement of higher capacities under the productivity year scheme of 1982 as per government notifications. Till the year end the authorities had still not re-endorsed the industrial licences. Likewise, delays in price approvals held up the launching of the new antifungal drug Canestan.

The rubber chemicals division showed an increase of 12 per cent in sales. The rubber industry faced difficulties with power cuts and communal problems curbing production in the North, while over capacities and the sluggish conditions affected the tyre industry throughout the country. Increased rubber chemicals imports also affected the division's performance. A price adjustment in the last quarter of the year as well as improved product-mix and rigid cost control helped to maintain profitability at the previous year's level. The pesticides division recorded a 14 per cent sales increase over 1983. The company improved its strong market position in agricultural pesticides. Products of household use showed an increase of 10 per cent, whereas public health sales were marginally down on account of lower purchases by the government. While the company continued to comply with the government's directive of supplying methyl parathion technical to a large number of non-associated formulators, endorsement of the established capacity in the industrial licence as per the policy announced in April 1982 was still not obtained by the year end. Strong competition amongst already established suppliers was intensified by the addition of several new producers. This made it quite difficult to pass on the entire cost escalation in time. Better plant utilisation and growth in higher added value products improved the division's profitability. The company received a letter of intent for the manufacture of 200 tonnes of methabenzthiazuron, but the management says that due to non-availability of intermediates in the domestic market the project needs to be reconsidered. Commenting on the future prospects, the new Chairman has welcomed the Union Budget and stated that it has set the stage for increased industrial and agricultural production. He feels that in this atmosphere a professionally managed company such as Bayer (India) supported by the enormous technical know-how base of the West German firm, should continue to grow.

*BARODA RAYON CORPORATION* is further diversifying and expanding its activities. The company has secured a letter of intent to set up a newsprint plant with an annual capacity of 50,000 tonnes in Ratnagiri district of Maharashtra. It has also received permission from the government to manufacture oleum 24 per cent upto 10,800 tonnes per annum within the overall licensed capacity of 21,600 tonnes per annum of sulphuric acid. Meanwhile, the plant for purification of mono ethylene glycol recovery is under construction and is likely to be commissioned by the end of the current year. The company has got a licence to raise the nylon tyre-cord capacity from 2,000 tonnes to 4,000 tonnes per annum, including the tyre fabric capacity to 3,400 tonnes per annum, and the company has taken effective steps to implement it. Arrangements for the requirement of foreign exchange loans for the import of plant and machinery and rupee term loans for setting up this high capacity have already been finalised with the financial institutions. The company hopes to start production of polyester POY (Partially Oriented Yarn) during the current year under the scheme of modernisation and that would complete the final phase of modernisation of the nylon and polyester division. The company has received a letter of intent to step up the nylon filament yarn capacity from 2,436 tonnes to 6,000 tonnes per annum. The capital goods clearance has been already obtained for importing the necessary equipments. The government has also approved the terms of foreign collaboration. Further steps are being taken to obtain foreign exchange loan from financial institutions. The company's application for increasing the licensed capacity for the manufacture of polyester filament yarn is being processed by the government. The company has turned in poor working results for 1984 with a decline in gross profit from Rs 8.90 crore to Rs 8.32 crore despite increase in turnover from Rs 70.17 crore to Rs 82.27 crore, reflecting dimunition of margins. With the provisions for depreciation and taxation requiring more, net profit has dropped from Rs 4.43 crore to Rs 3.39 crore. The unchanged dividend of 15 per cent is covered 1.75 times by earnings against 2.32 times previously. Profit margins were eroded due to steep rise in the cost of inputs, mainly on account of the high exchange rate of the US dollar required for imported materials and, consequently, higher import duty, etc. The burden of excise duty on yarn continued to remain on a high level. Besides, the liberal import policy of yarn had a depressing effect on the demand in the market. The trend of sluggish demand for rayon yarn, which had set in a couple of years ago, continued till September 1984. Thereafter, the company saw a revival in demand. The directors feel that if the present market conditions continue, the rayon division may start contributing to the profits. The nylon tyre-cord division achieved a 33 per cent higher production in the year and production in the nylon division was also higher during the last quarter of 1984. The liability arising out of the Superme Court judgment in respect of Section 80 J of Income-Tax Act alongwith other tax liabilities in respect of previous years amounting to about Rs 130 lakh have been met out of general reserve.

*RANBAXY LABORATORIES* continues to expand its activities. It has decided to set up another antiobiotic manufacturing facility in the centrally backward area of Punjab close to the existing plant. This plant is expected to be in production by the end of 1986. The addition of a fully automatic injectables unit to the Dewas formulations plant should go on stream towards the end of this year. Meanwhile, the company has received approvals for the manufacture of bulk pentazocine and bulk ibuprofen. It has made applications for the import of technology and capital goods for pentazocine. The foreign collaboration agreement for surgical dressings and bandages has been approved by the government. The company has also received a letter of intent for the manufacture of Plaster of Paris bandages based on imported technology and equipment. The company has produced good working results for 1984 even though the continued rigid price control system affected its profit margins. Sales amounted to Rs 48.58 crore against Rs 35.03 crore and gross profit was up from Rs 2.72 crore to Rs 3.85 crore. Although provisions for both depreciation and taxation took away more, net profit was Rs 2.66 crore against Rs 1.98 crore of the previous year. Dividend has been stepped up by two points to 20 per cent and is covered 5.40 times by earnings against 6.53 times previously. The directors point out an instance of "glaring injustice and unfair play" in the matter of pricing. In spite of a substantial increase in the price of bulk rifampicin from May 1984, the government has so far not granted any increase in the prices of rifampicin formulations, which has resulted in making those products highly unremunerative. While reducing the price of rifampicin formulations in December 1983, the industry was assured that the rifampicin formulation prices would be reviewed every quarter and increased if the situation so warranted. The company's new activity of animal health care products is gradually picking up. The company's efforts to increase exports achieved significant success and exports, including those to Nepal, rose to Rs 4.45 crore as against Rs 3.27 crore in 1983. The company made a beginning with the export of its bulk drugs to the developed countries in the western world and this activity is showing an encouraging trend. For its good export performance, Ranbaxy has again won an Award from the Basic Chemicals, Pharmaceuticals and Cosmetics Export Promotion Council for 1983-84. The company continues to lay emphasis on R and D. It has now decided to set up a fully equipped modern R and D Centre.

*GOODYEAR INDIA* produced during 1984 India's largest earthmover tyres. Over 8 feet tall, this massive high-tech tyre is for fitting on earthmoving machines capable of loading 85 tonnes, now being produced in the country mostly for use in coal and copper mines. Each tyre weights 1,078 kgs and has a load carrying capacity of 21,800 kgs. The tyre has a star attraction at the International Mining Machinery and Engineering Trade Fair at New Delhi. The company has recently exported these tyres to Ljubija Iron Ore Mines in Yugoslavia. The company was able to produce 7.81 lakh automotive tyres and 7.07 lakh tubes during 1974 in spite of the worst-ever power problems in Haryana, as against 6.23 lakh tyres and 4.85 lakh tubes in the previous year. Sales turnover also expanded from Rs 60.26 crore to Rs 85.83 crore, but the company had to fight a losing battle on the profits front as reflected in a trading loss of Rs 131 lakh against a gross profit of Rs 140 lakh previously. After depreciation, there was a net loss of Rs 249 lakh, forcing the directors to skip dividend which was paid at 14 per cent last year. The company was able to step up FOB value of export sales from Rs 80 lakh to Rs 316 lakh. The directors state that the company lost the equivalent of 60 days production due to power problems. Higher output per day when power was available made the increase in output possible in these circumstances. Notwithstanding the surplus production by the industry resulting in unhealthy competition and uneconomic selling prices, the company's entire production was sold. Closing inventories in fact were less than the previous year. Because of cost escalation and lower selling prices, the year's operations ended in a loss. The unusually severe power problems aggravated the cost escalation through wages for idle time, disruption in production schedules, higher waste and use of outside facilities for rubber mixing. The inflationary trend in the prices of various raw materials such as as natural rubber, SBR, rayon tyre-cord fabric, chemicals and higher fuel prices, coupled with their increased transportation cost adversely affected profitability. The company's land, buildings, railway siding and plant and machinery have been revalued based on the report of approved valuers. The net surplus arising out of the revaluation amounting to Rs 28.16 crore has been credited to Revaluation Reserve Account.

Commenting on the current year's prospects, the directors say that major investments in fixed assets made during the past two years have started yielding the expected results. Power, which had been a serious problem last year, has ceased to be so now that three diesel generators with a total capacity of approximately 8 MW have been installed and commissioned. These generators will ensure round-the-clock production at Ballabgarh and as the plant is operated seven days a week, the company has programmed production for 325 days excluding holidays and maintenance time. This will mean plant utilisation for 72 more days compared to 1984 or almost a 30 per cent higher production plus the cost benefits of uninterrupted operation. Output during the first three months point favourably in this direction. The earthmover tyre expansion project is now on stream. Moreover, several cost reduction measures initiated earlier are now in effect and the results so far are encouraging.

*ESSAR SHIPPING*, a dividend paying company engaged in shipping and offshore services is coming out with a linked issue of 50 lakh equity shares of Rs 10 each and 3 lakh 13.5 per cent secured non-convertible debentures of Rs 100 each, both at par. The applicants will have to simultaneously apply for equity share and debentures in the proportion of 50 equity shares and 3 debentures or multiples thereof. The object of the equity issue is to list its shares on the stock exchanges and of the debenture issue to augment the long term resources for working capital requirements of the company. The issue is managed by the Merchant Banking Division of SBI and J M Financial. The company has a fleet of tankers and product carriers on charter with the Indian oil industry, which are used mainly for transportation of crude oil and petroleum products from production centres around the world to the Indian refineries and for the country's coastal distribution outlets. The company's bulk carrier is on international cross-trade and the coasters are used for transportation of cargo along and around the Indian coast. The company also has a fleet of specialised offshore supply vessels (OSVs), which provide support services to the offshore activities of Oil and Natural Gas Commisssion (ONGC). It is the only Indian company in the private sector which owns a Diving Support Vessel, a highly specialised vessel utilised to inspect the underwater platforms and pipelines of the ONGC and its repairs. According to Shashi Kant Ruia, managing director, over 95 per cent of the company's turnover is from fixed time charters, which ensures regular and assured return over a long period of time and protects the company from the vagaries associated with the shipping industry. As at the end of December last, the company's paid-up capital was Rs 20.17 crore and the reserves stood at Rs 26.52 crore. Its gross assets were Rs 233.68 crore. The company earned a gross profit of Rs 14.71 crore on hire and voyage income of Rs 27.90 crore, and after depreciation made a net profit of Rs 4.71 crore. The company repeated a dividend of 20 per cent. It is one of the few shipping companies, to have consistently paid dividends for the last few years. The company is poised for further growth and looks to the future with confidence. The company is a part of the ESSAR Group engaged in diversified activities in various fields including marine and specialised civil construction, offshore construction, ship owning operations and trading activities and has tie-ups and successfully completed projects with well-known foreign collaborators, such as Brown and Root International of USA, F Selmer of Norway, Sentab of Sweden and has now tied-up with the world renowed ITT for onshore drilling in India. The trading activities involve marketing of various marine and dredging equipment, both within India and abroad. The shipping activities of the Group were carried on in the name of Eassar Bulk Carriers (EBC) since 1975. In 1983, EBC merged wth Karnataka Shipping Corporation and the name of the amalgamated company was changed to Essar Shipping.

## NEW DELHI

# Policy-Frame for Seventh Plan

BM

WHILE the planners in Yojana Bhavan are plodding along, putting in extra hours of work to prepare the final draft of the Seventh Plan, major economic policy innovations and initiatives are being taken by the government under the banner of liberalisation and modernisation which mock at all assumptions and priorities of the Plan. Mention must be made in this context of the new textile policy which has been at last announced and the adjustments which have been made in licensing policy for the pharmaceutical industry in advance of the promised new drug policy. There is also the report of black economy by the National Institute of Public Finance and Policy which has been released by the Union Finance Minister for the seemingly laudable objective of encouraging a public debate on it. However, it was clear from the comments of the Finance Minister at the time of releasing the report that the findings of the report and the measures proposed in it for whitewashing the black economy are very much in accord with the philosophy of liberalisation of the economy which has gained ascendancy in the government. The Minister made a point of emphasising that the government had already taken advance action in the light of the recommendations of the report for dealing with the problem of black money and the parallel economy, such as relexation of economic controls and lowering of tax rates. The Union Budget for 1985-86 and the export-import policy for the current year are replete with measures on these lines.

The report on black economy is a frank panegyric on the virtues of the free market. It makes a strong plea for curbing the "strident increases" in public expenditure which together with economic controls and high rates of taxation are condemned as the main source of generation of black money. The Finance Minister was, of course, in no position to fall in line completely with the suggestion for drastic scaling down of public expenditure in view of the decision against the cutting of the Seventh Plan public outlay of Rs 180,000 crore. But he did not hesitate to endorse the suggestion that schemes should be launched as had been done in the past for voluntary disclosure of black money by offering immunities and incentives to those willing to disclose their black money hoards. Those with black money are to be encouraged to make investments in legitimate and open economic activity without any questions being asked about the source of funds. This is a prominent recommendation of the report.

The exact form of the schemes for whitewashing black money will take time to formulate. But the Petroleum and Chemicals Ministry has found it necessary to take quick action, in advance of formulating a new drug policy, for widening opportunities for operation of FERA companies in the pharmaceutical industry. These companies have been complaining of stagnation for long and claiming their right to be treated as Indian companies after they have agreed, by and large, to dilute their foreign equity to 40 per cent. These demands have now been conceded in principle and the FERA companies now hope to do very good business in a large number of drugs on which licensing and price restrictions have been relaxed. This gesture has been made in the hope of attracting foreign firms to invest in the industry. A great deal of reliance is placed on such foreign investment for generating expansionary impulses in the economy, especially in the industrial sector.

So far as the much awaited new textile policy is concerned, its principal thrust is to revive and modernise the mill sector by improving its competitive edge against the powerlooms which have proliferated in recent years to the disadvantage especially of composite mills. But its long-term implications, the loud protestations about special safeguards for handlooms notwithstanding, can only be the enlargement of the market share of the mill and the consequent squeezing out of the vulnerable segments in the textile sector, especially the handlooms. Also in the offing, quite explicitly, is rationalisation and retrenchment of labour in all segments of the textile industry—mills, powerlooms and handlooms—as a necessary part of the modernisation which is proposed under the new policy. The emphasis has also been shifted dramatically from cotton to synthetics and blends in the name of durable cloth at cheaper prices. The leadership role in the textile sector has been decisively passed on to the mills manufacturing synthetics and blends with help of labour-saving machinery, the more sophisticated and the more labour-saving the better. Such machinery will be allowed to be liberally imported.

Combine these policy initiatives with similar earlier ones, especially in respect of electronics, computers and automobiles, inspired by the modernisation fetish and the new faith in the efficiency of private enterprise (and the corresponding fatalistic belief in the innate inefficiency of the public sector). What emerges is the essential policy-frame, for the industrial sector especially, on which the Seventh Plan will have to rest. This situation is presenting many dilemmas for the planners.

It may be mentioned in this context that the team of planners which has been assembled in Yojana Bhavan cannot be said to be homogeneous and of one mind. There is a strong current in the Planning Commission of unbounded commitment to and naive enthusiasm for the liberalisation philosophy. It has not yet become predominant and commitment to development planning with social priorities retains its foothold in Yojana Bhavan. This became evident when moves to cut the size of the public sector part of the Plan from Rs 180,000 crore to Rs 160,000 crore were not allowed to succeed. Significantly, in this context, the role of the state governments in respect of resource mobilisation effort and Plan size was very positive. In the process, the share of the states in the total public sector Plan outlay improved from less than 39 per cent earlier proposed to about 43 per cent which partially, but only partially, corrected the gross imbalances and distortions in the Plan.

When, however, the sectoral allocations proposed for the Rs 180,000 crore Plan in the public sector are taken into account, the position cannot be regarded as so comforting and positive. It is in terms of the sectoral allocations that the liberalisation thrust of the economic policy-frame fashioned by the political authority becomes explicit. Two features in this context are prominent. First, industry and minerals in the public sector have been given a raw deal. Second, allocations for rural development which are relevant to poverty alleviation have suffered badly. The up shot can only be a slowing down of investment in basic industries which come within the ambit of the public sector and the blunting of the equity thrust of the Plan. This corresponds neatly to the government's economic philosophy and policy which postulate, on the one hand, passing the leadership role in industrial development to private enterprise and, on the other, reliance on the trickle-down process for the gains of development eventually reach the vulnerable strata of society.

The pattern and quality of industrial growth in the Seventh Plan should have novel features under the industrial policy-frame which the political authority has handed down to the planners. In the total outlay of Rs 180,000 crore in the public sector, the allocation under the head Industry and Minerals is only Rs 24,000 crore. This will simply mean a freezing of development of industry and minerals in the public sector.

It is readily admitted by the planners that the allocation which has been made for industry and minerals will not permit any new start on industrial projects in the public sector. The allocation will be barely enough to complete such of the on-going projects as will be given priority—for instance, three fertiliser projects and the gas pipeline. For the rest, it is likely that even on-going projects requiring large investment, such as the Vizag steel plant, will linger on and spill over to the Eighth Plan period. Even in respect of oil refining, provision is made only for expansion of existing refineries and no new refinery is to be taken up. The launching of new industrial projects is thus proposed to fall within the ambit of private enterprise, Indian and foreign, during the Seventh Plan period.

The stringency of resources for public sector investment generally and the claim of other priority sectors, among them energy and irrigation, on available resources is not, however, the only and certainly not the most important reason advanced for reducing the share of industry and minerals in the total Plan outlay in the public sector. It is also argued that it is necessary to give higher priority to what is called consolidation rather than expansion of industrial enterprise in the public sector. Hence stress during the Seventh Plan period is proposed to be on speedy completion of on-going projects rather than on new starts. This may, on the face of it, appear to be a plausible line of reasoning. But it has implications which should not be ignored. An interruption in the launching of new projects in the public sector will mean that they will never be launched. Meanwhile, reliance will be placed either on private investment, domestic and foreign, or liberal imports for meeting whatever pressing requirements of industrial products arise in the economy.

In any case, it is further argued, investment already made in the public sector industrial undertakings has turned out to be inefficient insofar as it is not giving adequate profits. An ingenious theory of a wider amplitude has been advanced on this basis. This was articulated some time ago with considerable aplomb by a senior official in the Finance Ministry who is believed to enjoy considerable influence in the shaping of economic policy.

According to this theory, investment must be efficient and cost-effective. This is an unexceptionable principle. But advocates of the theory stretch it to demand that domestic resources should not be invested in production of goods and services which can be produced more efficiently elsewhere and can be imported. The senior official in the Finance Ministry who propounded this theory at an international seminar of economic journalists went so far as even to suggest that it was wasteful to give aid to some African countries for investment in production of foodgrains. These resources, he said, might well be used more profitably by American farmers to produce more efficiently foodgrains for the starving Africans—and presumably also Asians and all the developing countries.

If this theory is rigorously applied to India, a case can be and is indeed being made out for not investing in areas such as heavy engineering and machine-making industries, steel, non-ferrous minerals and even oil refining in which public sector enterprise has played a pioneering role during the last three decades of planned development. It can be argued and is indeed being argued that, unlike transport and communication systems and power which cannot be imported, it is more efficient for India to import steel and metals, petroleum products and machines and capital goods of all kinds. It can, therefore, be demanded and is in fact being demanded that further investment in the public sector in these areas should be slowed down, if not halted altogether, in order to derive the advantages of the so-called efficiency of foreign enterprise in these areas. One is reminded in this context of the steel *versus* foodgrain's controversy when the Second Five-Year Plan was formulated.

It should not be easy to sell this line of reasoning in India which has made significant progress in industrialisation largely through a vigorous strategy of import-substitution, above all in the public sector, in the field of engineering, ferrous and non-ferrous metals and oil production and refining. But the din that has been raised by vested interests in recent years about what is alleged to be inefficient import-substitution, especially in the public sector, appears to have resulted in weakening the will of the political authority to maintain the advance on the road to self-reliant, self-sustaining industrial growth with investment in the public sector playing a commanding role in the process. The Seventh Plan, it appears, is designed to bring about a marked and decisive deflection from that path.

This indeed is the message of the relatively small outlay in the public sector on industry and minerals in the Seventh Plan. This is only emphasised by the policy adjustments on a wide front for opening the doors for private enterprise, Indian and foreign, to enter areas hitherto reserved for the public sector under the Industrial Policy Resolution of 1956 which was adopted by the government when a planned effort for rapid industrialisation was launched. A series of measures have been taken and fiscal concessions and other incentives have been given in rapid succession to enable private enterprise to take over the leadership role in the industrial development process.

The position is going to aggravate further as the associated theory in the name of improving the competitive quality of Indian industry as a whole—in the private as well as public sector—for opening Indian market to competitive imports is equally rigorously applied. The first steps in this direction have been taken by the sharp cut in customs duty and lowering of fiscal and other barriers—more markedly for imports of technology and capital goods. The cut in customs duties on import of capital goods is indeed quite remarkable. Combined with turnkey construction and management of new projects in the hands of foreign consultancy and engineering firms, the flood-gates will be opened for large-scale entry of foreign supplies backed by generous credit to overwhelm indigeneous production, especially of capital goods. As a planner apprehends, under the new policy dispensation, sickness will rapidly spread and deepen in the capital goods industry in the public sector and destroy the sinews of self-reliant industrialisation. If HEC and MAMC suffered in the past because of slow down of the steel and coal expansion programmes and reliance on turnkey arrangements in these sectors, the same fate will now befall BHEL and the machine tool industry in the public sector.

A significant issue to be also faced in the context of the shifts in policy on industrial development is the ability and willingness of private enterprise, Indian or foreign, to invest in basic industries and establish capacities for self-reliant and self-sustaining growth and modernisation. By its very nature, private enterprise is guided by profit-maximisation and is not concerned with any national or social priorities of a long-range nature. Indian private enterprise in particular is in no position, for historical as well socio-economic reasons, to muster either the will or the resources for taking up large, long-gestating industrial projects, let alone play a leadership role on a sustained basis in the industrial development process. Its role can only be to take advantage of whatever infrastructural facilities, including capacities for manufacture of capital and intermediate goods which have been built up in the public sector, to cater effective demand in the domestic market (as well as in the global market through subsidised exports) largely by entering into collaboration arrangements with foreign capital, especially the multinational corporations, as the junior partner. The result will not be industrialisation on a firm economic foundation and a broad social base. Important in this context is the shift in priorities in industrial investment towards private transport and entertainment electronics.

With the proposed slow down of public investment for the development of basic and intermediate industries in the Seventh Plan, it will logically follow at the present stage of India's socio-economic development that those who advocate dependence on supposedly more efficient producers of capital and intermediate goods elsewhere will have a decisive say in the further evolution and refinement of economic policies. The Seventh Plan essentially marks the rejection of the Mahalanobis model on which the industrial development effort launched by the Second Five-Year Plan was based. Neo-colonial approaches and solutions of socio-economic problems which have emerged in the framing of the Seventh Plan are bound in due course to gain absolute ascendancy within the political establishment.

The sectoral allocations proposed in the Seventh Plan appear to fully confirm these ominous trends. But the result of this will not be, as is fondly hoped, a return to the peasant paradise such as Charan Singh hopes for when he tilts against investment in industry, but ruthless neo-colonial exploitation of the Indian economy and people. Only a thin upper stratum of the population will share a small part of the loot in this dispensation in the name of modernisation and rushing towards the 21st century.

## New Spate of 'Encounter' Killings

### KB

THE sky is hot, the wind is hot, and the brown barren earth is baked hot; only the *babul* with its black bark and jade green crown stands out against the white heat of May. The dust road meanders through the deserted villages of Vemulawada whose mud walls implore you to 'Vote for Y Kasipati, CPI-ML candidate, on the Spade symbol'. But the houses and streets are so palpably empty that you would be justified in thinking that the ghosts have written the graffiti, if you did not know that the elections were over in March and this was May.

No, not all the people have been driven away by the police. Some have, but the others have a more natural reason for being away. This is summer, and summer is the season for travel. For the landed and the propertied it is the time between the second crop and the next season, and so the time for visiting gods and kinsfolk; it is the season of marriages too, by the almanac of an agrarian society. For the poor and the labouring, it is the time to go out in search of work, for they have saved nothing from the kharif and rabi seasons and if they don't find work elsewhere then they will starve. Some of them have moved to neighbouring villages to deepen the wells of the landed classes for the summer crop; some have gone farther to the sites of projects and canals; some, the younger, and more enthusiastic among them, have gone all the way to Bombay to work on the powerlooms of Bhiwandi or in the mills of the city, for there is a steady emigration from Karimnagar to the city of Shiv Sena. The more reckless among them will travel by the 'semi-luxury' bus run daily between Jagtial and Bombay by the State Road Transport Corporation; and the more prudent of the lot you will find queuing up at Kazipet railway junction buying tickets by the Minar Express to Kalyan or Dadar. You will recognise them easily for they travel in unkempt droves and buy their tickets with soiled wads of notes. Of these youthful emigres, the more outrageously ambitious have a further design. They have begged and borrowed a few thousand rupees and they hope that from Bombay they will bribe and buy their way to the Promised Land of Indigent Indians, referred to with varying degrees of inaccuracy as the Arab countries, the Gulf countries, the Oil countries, or just 'Muscat-Dubai' as in Karimnagar. They hope to go there and stay for a couple of years and earn not only their keep but enough extra to buy those three acres of land that will make all the difference between a hand-to-mouth existence and passable comfort. In many cases, the brokers—most of them local landlords—will swindle them of all their money before they leave the shores of Bombay; even if they manage to reach the magic land of Oil, in most cases they will come back with just enough money to settle the high-interest debt contracted for the purpose, the only extra being some outlandish memento like a vacuum-cleaner which the bemused mother or wife back home will preserve as a precious *Object d'Art* . And the few who do manage to come back with substantial surpluses will discover that the landlords—who are the only ones with land to sell—have inflated the price of land, and the effort has not been worth the candle.

Tadu Rajaiah and Vuppala Lakshmirajam were two such 'ambitious' youth, of Venkatraopet in Vemulawada taluka. Rajaiah was the son of a peasant with two and a half acres of land and Lakshmirajam's was a landless family that cultivated one and a half acres on lease. The two of them had borrowed money in bits and pieces of a hundred or two from each of a large number of creditors, and had by this means accumulated quite handsome amounts. Lakshmirajam had collected Rs 12,000 and Rajaiah Rs 25,000. That poor peasants could raise such amounts is an indication of how profitable the business of lending money to Muscat-Dubai ventures is. But it is one thing to get money and quite another to get a job and a passport. For this, they had been hanging around their brokers in Bombay for the last three years and had perhaps spent much of their money.

At the beginning of this summer they got letters from home asking them to come back and help in harvesting the crop. Rajaiah came back on the March 10, and Lakshmirajam on the April 6. They were both killed by the police on the night of April 10, along with three others.

The police describe the killing as an 'encounter'. According to Shareif, CI of Police of Vemulawada (and please listen) on the night of April 10 he came to know of the presence of an armed squad of extremists camping at the boundary of Venkatraopet and Kondapur. He went there with a party of policemen including SI of police Francis of Vemulawada and SI of police Veeraswamy of Gambhirraopet. As they approached, the extremists got up and threw bombs at them. The policemen identified themselves and asked them to please stop throwing bombs. They, however, continued to throw bombs. The policemen again repeated their courteous admonitions. This time the brazen lot threw grenades at them and fired with rifles. Unable to tolerate this impudence any further the policemen took position and fired at the extremists. They went on firing till they felt sure that the threat to their lives was overcome and then stopped firing and went over to the spot where the extremists had assaulted them from; and lo and behold! All the five naxalites were stone dead. Such marksmanship at 2 am of a moonless night must excite the admiration of the worst critics of the Indian police.

What really happened was much less heroic. That night Rajaiah and Lakshmirajam went to the fields to guard their half harvested crop. In the fields they met three activists, Raghupathi, Sathaiah and Gangaiah. The five of them—and an unidentified sixth person—sat and talked till late in the night. Perhaps they talked of the way the police had ravaged these villages during the last two elections to prevent people from voting for the CPI-ML candidate; perhaps they talked of Sathamma of Samudralingapuram who was raped on the night of January 13 by the policemen of Mustabad and Gambhirraopet police stations; or perhaps—as is most likely—they talked of the swindling brokers who are making piles of money from the Gulf emigration business.

They slept at an open spot on the ridge-like elevation separating Venkatraopet from Kondapur. They were awakened by policemen prodding them on the chest with rifle-butts. The policemen tied their hands behind their backs. They then held a brief consultation and decided to finish them off. They fired at them with sten guns. Lakshmirajam and the unknown sixth person managed to break out and run away. Lakshmirajam was chased and gunned down by the police but the sixth person escaped in a severely wounded condition. It was when he met some reporters of *Indian Express, Andhra Prabha* and *Udayam* and revealed the facts to them that the truth came out. It was published widely in the Press, and caused widespread revulsion in the public. But predictably, not only did the police feel no sense of shame, they even had the gumption to summon the editors of these newspapers to present themselves before the CI of Sirsilla (the officer who issued the summons) and give information about the escaped 'extremist'. The remarkable aspect of the entire episode is that the Chief Minister did not even make face-saving noises—as one would normally expect him to do—at any point of this scandalous affair. Instead he has maintained a stubborn silence and his Home Minister dismissed it casually as a 'routine affair' unworthy of the fuss the Press was making.

### THE BEGINNING

This sensational killing was only the most widely publicised of the 'encounters' committed at the behest of N T Rama Rao's government this year. It was neither the first nor the last. The first took place on January 21 at Pochampalli (under Pembatla gram panchayat) in Jagtial taluka of Karimnagar district. The victim was 35 year old Khairi Gangaram, a person described by the police as a 'terror'. However, there is no record that he was a terror to anybody other than the notorious Velama landlords of Jagtial. Nobody (excepting the police) as yet knows exactly how Gangaram was killed. The police version (as usual) is that he died in a shoot-out, and notwithstanding his reputation as a 'terror', no damage of consequence was done to the police officer who 'encountered' him. The closest one can get to the truth is that he was talking to some people in a house in the village that day at about 11 am, when news came that the police had come to the village scenting his presence. The persons he was talking to left in a hurry, and he bolted himself inside the house. The police officer came to the house and asked him to open the door and come out. He refused, saying that he feared he would be killed. The Inspector is then believed to have climbed on to the roof, pulled off a couple of tiles, and shot down Gangaram. Whether Gangaram returned fire at the roof, and if so with what material effect, is not known. Those who believe that a police officer would be incapable of such feats may be told that the police of Karimnagar have long-standing expertise in the matter. Over the last couple of years, they must have pulled down the roofs—to the last tile and the last bit of thatching—of at least 200 houses.

The second killing took place on March 28. The locale this time was a tribal (Koya) hamlet of 40 huts by name Veerabhadraram in Bhadrachalam taluka of Khammam district. Bhadrachalam is a temple town located on the northern banks of the Godavari. Northwards from the town the road goes into a wide expanse of deforested plains populated by forcibly peasantised Koyas and caste-Hindu landholders who have made a lucrative business of growing tobacco. The law, of course, says that the non-tribal landholders should not be there, but they are there nevertheless. Indeed, Bhadrachalam, a very holy place for the Telugu people, should actually not be in existence if the law reflected reality. Every inch of the town (including the temple and the God) is owned by non-tribals, though they may have no papers to show for it. As with the ancient Dharmasutras so with the modern law of this country, the dictates reflect more the hopes of the law-makers than any substantial reality; and they are meant to be chanted, not practised.

Arsepalli Venkateswara Rao alias Chandranna was the activist who was killed in this 'encounter'. He appears to have been quite popular with the tribals and the youth of this area. Indeed, after his killing it was the CPI youth (who normally have little love for the naxalites) who insisted on covering his body with a red flag—but the police would not allow it. Anyway, he was not well for some days before his killing. On March 28 he reached Veerabhadraram at about noon, and went to the house of a Koya by name Matta Lakshmaiah. This 'house', properly described, consists of one big hut and one small hut, neither of them possessing even mud walls. Chandranna lay himself down in the smaller of the two huts. He had an appointment there with an excise contractor. The police—acting upon information provided by the contractor—came into the village. They apparently divided into two or more groups and fanned out in search of Chandranna. One group came to Lakshmaiah's house. Seeing them, Chandranna got up and ran. Lakshmaiah's wife Chinnakka says that he had a bag with him but did not take out any weapon from it. The police chased him and fired at him from behind but missed; but about 200 yards from the house another group of policemen coming from the front fired directly at him and killed him instantly. He had one bullet wound in the chest and one in the forehead. Unlike in some other cases, the police did not even claim that any policeman was even injured in this 'encounter'. They merely called in a doctor from Bhadrachalam to do the post-mortem at the spot of killing (the post-mortem is always done at the spot of killing, and never in a properly equipped hospital), then they themselves cremated the dead body (which is again their routine practice), and finally set up an armed police camp in the hamlet to seal it off from the outside world.

### MAY DAY

The third was the Venkatraopet killing that we described in the beginning. One would have thought that the shame of it would have stayed the hands of any civilised government; but no. The fourth one took place within twenty days, on the first of May, this time in Nizamabad district. The village is Baswapur, Domakonda taluka, located on the Seventh National Highway, 20 kms short of the taluk town of Kamareddy as one goes from Hyderabad. The village is to the right of the Highway and the spot of killing in the fields to the left, beyond the metre-gauge railway line that joins Hyderabad to Nizamabad and onwards to Parbhani and Manmad in Maharashtra. Four activists were sitting under a mango tree, and the fifth, a young lad by name Babu of Muthyampet village, had gone to a nearby well to fetch water. Babu had joined the activists only *one* day before, and was by no means a 'wanted extremist' as claimed by the police. The police (an anti-naxalite squad) came to the spot. The time must have been around 2 o'clock in the afternoon. The police are said to have received information either from the toddy contractor of the village or the Sarpanch (who is also the Tendu contractor); these persons had, at any rate, adequate reason for informing the police, since the struggle in the village had been for the reduction of the price of toddy from one rupee per bottle to 50 paise; and increase in the wages paid for picking Tendu leaf from 11 paise to 20 paise per bundle of 100 leaves. In any case, the police did come, and a shepherd boy who saw them first called out to the activists to save themselves. Babu lifted his head, saw the police, and ran towards the mango tree. The police fired, hit him in the back, and he fell down near the mango tree. The other activists ran away, but the police chased them and fired at them. One activist, Rajanarsu, fell down. The others turned back, fired at the police, injured a constable in the shoulder, and saved themselves by running away. This, incidentally, is the only 'encounter' where a policeman was at least injured.

What happened subsequently is quite macabre. It is not known whether Rajanarsu died immediately, but Babu certainly did *not*. He was injured in the back but was alive and fully conscious. The police tied his hands behind the back with his own clothes, and called out to two peasants in nearby fields, who were watching the drama. One of them was Siddaramulu, who was getting the motor of his irrigation well repaired, a hundred metres away; and the other was Pundarikam, who was closer by and had a detailed view of the entire affair. Upon order from the police, Siddaramulu brought water and gave it to Babu, who drank it and started answering the policemen's questions. The policemen then asked Siddaramulu to go and see whether the other injured person, Rajanarsu, was alive or dead. He refused, and was told to make himself scarce. Pundarikam was kept with the police until the inquest, the post-mortem and the cremation were over by the next evening. Only he, when he decides to open up (he refuses to talk to anyone at present) knows how Babu died: Did he slowly bleed to death, or did the police kill him deliberately after interrogating him?

On the night of May 6 there took place,

again in Karimnagar district, an 'encounter' comparable in its brazenness with the Venkatraopet killing. The village was Bommireddypalli, in Sultanabad taluk, about 40 kms towards the Godavari river from Karimnagar town. The victims were Siddaiah, a naxalite activist, and Panuganti Rajalingu, a 30-year old peasant with three acres of land. Rajalingu was neither a naxalite, nor even an active associate of the naxalites. The event that entangled him in the state's widespread net is typical of the medieval way in which Karimnagar has modernised itself during the last decade.

It is not often realised that in feudal societies, theiving—as much as whoring—is an important activity organised by the landlord class. The feudals of Telengana, as late as the 1940s, were famous for organising gangs of theives to go around looting villages. It served, as far as one can see on the face of it, two purposes; one, to augment the landlords' loot; and two, to keep their private thugs in money and out of mischief when their services were not needed by the master. It is obviously a remnant of the time when feudatories maintained armies which fought for the king when he needed, and otherwise kept themselves in money by looting the people. With the beginning of the modernisation of Karimnagar, the landlords have started organising a modern version of this activity. They encourage gangs and private theives to steal the vital parts of agricultural machinery—irrigation motors, tractors, diesel, etc—and sell the loot in shady spare parts shops in Karimnagar or Jagtial town. One major activity of the peasant movement of Karimnagar has been to prevent and expose this organised theiving. Thus it happened that when somebody stole the belt of Rajalingu's irrigation motor, he reported the matter, not to the police but to 'the Party', as they say; 'the Party' apparently managed to discover that it had been stolen by somebody from a village by name Pathipaka Narsingapuram; they recovered the belt and Siddaiah went to Bommireddypalli on June 6 to return it to Rajalingu. The latter, out of sheer gratitude, asked Siddaiah to have food with him and sleep in his house. They had food, but it was not clear whether Siddaiah slept in Rajalingu's house or went out and slept somewhere else in the village. According to Chandramma, Rajalingu's wife, who has however been properly terrorised by the police, Siddaiah went out to sleep somewhere else, while she slept in front of the house and her husband by the side of the house. At night the police, led by SI Khaja Mohiuddin of Dharmaram police station, came to the village. They stepped over the sleeping Chandramma and arrested her husband and took him away. 'They will keep him till they find Siddaiah' she says she told herself, for every peasant in Karimnagar who has ever given food to a naxalite activist knows that he may be picked up any day and kept hostage (and tortured, of course) until the activist is found. But she did not reckon with the possibility that he may be killed. Either with or without the aid of Rajalingu the police located Siddaiah within a short time. Chandramma pretends that she was fast asleep and therefore ('since a sleeping person is like a dead person', she repeats woodenly) did not know what happened, but at the same time bursts out to say that the police tied both men to a tamarind tree and killed them. And she even points to the tree, which is just about 50 yards behind her house. The next morning, at 8 a m, the police came and told Chandramma that her husband had died; after the inquest was over, and the post-mortem was done at the spot of the killing, the police handed over Rajalingu's body to Chandramma (a very rare gesture, apparently prompted by some sedimentary residue of human feeling) and themselves cremated Siddaiah's body near the tamarind tree which was witness to the killing.

Exactly a week later, and this time in Adilabad, there was the next 'encounter'. The day was May 13 and the village Lodvelli in Sirpur taluka. The papers of May 15 carried confused reports of an armed confrontation between the police and naxalites in which one police officer said two and another said three extremists were killed. The SP of the district clarified a couple of days later that it was only two.

There was cause enough for the confusion. Late in the evening of 13th a large number of activists entered the village. They went to a hut near a dried up rivulet outside the village. Near the hut there is a *kallam*, the collection spot for Tendu leaf, where the people bring the Tendu leaf and the contractor's man (the *kalledar*) collects it. Since the Tendu season was as yet not over, there were some villagers at the *kallam*. Of the activists, three sat inside the hut, and the rest stood outside, talking to the people. The time must have been about 9 p m. A police party came and shone their torchlight; the activists outside the hut asked them to put it off, upon which the police identified themselves and asked the activists to put up their hands. Those who were standing outside the hut then ran away. The police first shot blindly with sten guns into the hut, injuring two of the three sitting inside—Puli Madhunaiah and Ankoli Ramesh. They then fruitlessly chased those who had run away, and came back. To be on the 'safe side' they again fired into the hut. The third person inside the hut suddenly emerged and ran out. The police fired at him as he ran, and were not very sure whether they hit him or not. That was the reason why they were not sure whether they had killed two or three.

## APPOINTMENTS

**INSTITUTE OF ECONOMIC GROWTH**

University Enclave,
Delhi - 110 007.

Applications are invited for Fellowships in Economics for pursuing PhD Degree of the University of Delhi. The Fellowships are in the areas: (a) Agricultural Economics (b) Investment Planning and Project Evaluation and (c) Money, trade, income and employment. The award is subject to the candidate's securing admission to PhD of the University of Delhi.

**Qualifications:** Consistently good academic record with a First or High Second Class MA Degree in Economics with Statistics and/or Econometrics as special subjects. Candidates with M Phil and/or Research experience will be preferred.

The fellowships are initially for a period of one year. These fellowships are tenable for a maximum of four years subject to satisfactory progress. The present rate of fellowship is Rs 600 per month for the first two years and Rs 700 per month for the next two years with a fixed contingency grant of Rs 3,000 per annum. These rates are likely to be enhanced.

Applications with full details (date of birth, qualifications with class and percentage of marks at the graduate and post graduate levels, papers offered, University and research experience, if any among others) indicating the area of their choice in order of preference accompanied **by a typed research proposal in any one of the areas** not exceeding 10 pages should reach the Director on or before 31st July, 1985. The envelope should be marked "Application for PhD Fellowship"

**Director**

There is a tail-piece to the story. Releasing their story to the press, the police said that in addition to the impressive haul of dangerous-looking weapons which they always claim to find with dead naxalites (though the naxalites appear to be singularly incapable of using the arms they have accumulated), this time they also found Rs 75,000 in cash. It was learnt later that the activists actually had Rs 2.5 lakh of their Party funds with them. The police, apparently, decided to disclose only Rs 75,000 and keep the rest. This, once again, is not an exceptional gain, for the police—especially in Karimnagar—have made handsome profits out of this business of 'suppressing extremists'. Excise contractors make regular monthly payments to them, and landlords as and when need arises. Another method of making money is to get hold of dozens of poor peasants, put them in lock-up, and demand money for their release. Most of the police inspectors of Karimnagar have made lakhs of rupees in this manner.

## RASH OF 'ENCOUNTERS'

In the last week of May there was a sudden rash of encounters. One on the 26th, one on the night of 27th, and one on 28th. The first was at Chinanakkalapet under Dharmapuri police station limits in Jagtial taluka. The victim was G Narayana. The only details known are that Narayana and another activist were conducting an arbitration in the village at about 1 p m of that day. A police party came, and the people as well as the activists ran away. The police chased them; the other activist ran away but Narayana got killed.

More details have become public regarding the next killing, at Narsapur in Warangal district. Indeed, the police would perhaps wish that so many were not known, for the event has led to a lot of unsavoury publicity for them. The police story is that on the evening of May 27 they came to know that a group of 'underground extremists' were having a meeting at the outskirts of Narsapur. A police party led by the SI of Mulug is said to have gone there and had the usual 'exchange of fire' with the extremists, as a consequence of which two of the latter, Pingli Bhupati Reddy and Kavatam Saraiah, died. The true story is quite different. Firstly, Saraiah was by no means an 'underground extremist' as claimed by the police—he was regularly attending court in the few cases in which he was accused. On the morning of May 27 he came to Warangal town, to the house of his advocate P Prabhakara Reddy. The advocate handed him the keys to his house, and went with his wife to Hyderabad by a mid-day train. Saraiah was alone at the advocate's house till 10 p m in the night. At that time Bhupati Reddy came there. He told two or three persons he met on the way that he was going to his advocate's house, and his younger brother Raghupati Reddy accompanied him upto the house. He and Saraiah cooked food for themselves, but before they could eat, the police came (at about 10.30 pm) and arrested them. They were taken in a jeep 54 kms to Narsapur, then taken one km further from the village to a spot that could look like a jungle in a smudged photograph, and gunned down. The only reason for the choice of Narsapur appears to be that it is the closest place from Mulug police station (the station that made the catch) which looks somewhat like a forest. The police, for some reason of psychology or propaganda, always choose a spot that can be described as a forest when they decide to kill a naxalite after arresting him. Perhaps it gives them a feeling of having been heroic.

The next day they brought a doctor from Mulug to perform the post-mortem on the spot, and after putting the bodies on the funeral pyre, allowed the father of Bhupati Reddy and the wife of Saraiah to have a look at the faces of the dead men before cremating them. Typically, they paid a measly amount to the cremators and the bodies lay there half-burnt for long afterwards.

May 28 saw an 'encounter' at Jagtial that contains the essence of all that is lawless about these killings. The newspapers carried two stories, both supposedly released by the police. According to one version, there was a 'suspicious person' in a house on the outskirts of Jagtial town. The police went there and asked him to come out; whereupon he dashed out and got onto a motor cycle and rode away. But even as he rode he turned back and fired upon the police (in the manner of some Puranic heroes who could shoot arrows backwards), and the police, to save their lives, fired at him and killed him. In the second version there is no motor cycle but he merely ran and fired back. The police identified the victim as Pavan Kumar, and even claimed that they found upon him a service revolver allegedly stolen from an Inspector by the naxalites last year at a village by name Gattubuthkur. A couple of days later it transpired that there was some confusion regarding his identity, and exactly a week later the District Magistrate and Collector of Karimnagar announced that there would be a magisterial enquiry into the death at Jagtial of an 'unknown naxalite'. It does not seem to have struck anybody as quaint that the victim should be identified as a naxalite even before he could be identified by name. (But stranger things have happened in this state that has lent the term 'encounter' to the lexicon of state terrorism; in year 1981 there was the death in an 'encounter' in Nalgonda district of a person described as "an unknown naxalite belonging to the Re-Organisaing Committee of CPI-ML, which is surely a more uncanny performance.)

What really happened that day at Jagtial was this: the victim's name was Govinda Reddy, and he belonged to Nizamabad. Indeed, he was originally of Chitradurga district in Karnataka and after working and resigning from the Indian Air Force, and later working as a hotel manager at Nizamabad and resigning from that post too, he joined the naxalites. The police would find it terribly embarrassing to connect him with the revolver-snatching incident at Gattubuthkur. He was staying at a house at one end of Jagtial town that morning, and had sent a boy to fetch him cigarettes. The police got suspicious of the boy buying cigarettes and went with him to the house, where they found Govinda Reddy. They caught him, took him out on to the Dharmapuri road, and killed him. It was after killing him that they tried to give him a name, and perhaps by some facial resemblance decided that he must be Pavan Kumar. The Gattubuthkur revolver was added on to lend a touch of 'investigation', which has later turned out to be embarrassing.

## CONCLUSION

Somebody is bound to ask why all this is happening. The shortest answer is that N T Rama Rao wants it to happen. It is no accident at all that barring the first of these killings all the rest took place after his resounding victory in the recent Assembly elections. The victory, against the odds set by Bhaskara Rao's defection and the split in his party, has given him the kind of confidence he needs to indulge in such killings. Indeed, not only the killing of naxalite activists and their sympathisers, but much worse is apparently in store. The papers of June 11 carried a news item that the state government would use the Central government's Terrorist and Disruptive Activities (Prevention) Act, and further (with due regard for democratisation of Centre-State relations) would enact its own Terrorist Act to be used alongside the Central Act. Terrorism is to be defined, as in the Central Act, as an act of violence perpetrated with the intention of terrorising the public or threatening or overawing the state or any public servant, but with the novel definition of 'public servant' to include anybody who aids the police, that is to say the professional informers and stock witnesses whom the police employ the world over in the execution of their duties. In addition, the Act would designate certain organisations as 'front organisations of naxalites' (this provision is apparently aimed at civil liberties organisations); and it would give the police the power to declare (as and when occasion arises) certain areas in the state as 'prohibited zones' where the designated organisations would not be allowed to enter. The movitation for this peculiar provision is obvious: the police will kill somebody in an 'encounter' and then declare that the area is a prohibited zone for civil liberties organisations, so that nobody can know what really happened in the 'encounter'.

On the same day that this news item appeared in the papers, a civil liberties delegation led by George Fernandes, General Secretary of Janata Party, met NTR and asked him about the report. He put on the best histrionic performance of his career, and denied all knowledge of the Bill. But a few days later he told pressmen that he intended to introduce it. One has to wait till the monsoon session of the Assembly to know whether and what shape the Bill will take.

## MAHARASHTRA

# Adivasis, Law and Social Justice

**Sharad Kulkarni**

THE Maharashtra Restoration of Lands to Scheduled Tribes Act is a unique piece of legislation as an attempt to extend social justice through the resotration of legally alienated lands to Adivasis in the state. The Act, like every attempt at social justice, was challenged in the courts. Some social scientists described it as an attempt to weaken the foundations of democracy. The Bill took a long time to receive the President's assent. At last, a three-member bench of the Supreme Court has, in an unique judgment, rejected all the objections raised against it. The ball is now in the court of the Government of Maharashtra and it is to be seen if it has the political will to implement it against the vested interests of the non-Adivasi landlords who are the main supporters of the ruling party. The entire episode highlights the obstacles to any attempt at social justice and needs to be described in detail right from the beginning.

The process of taking over the lands held by Adivasis through force and fraud began with the stabilisation of British rule in Maharashtra. The process was accelerated by the development of transport, establishment of individual rights over agricultural lands, commercialisation of agriculture and the spread of the English judicial system. After Independence, it was further accelerated by the rise in land values, increase in population and other factors.[1]

### ANTI-ALIENATION MOVEMENTS

Most of the Adivasis in Maharashtra, as everywhere in the country, are small farmers and agricultural labourers. The large-scale alienation of lands, mostly through force and fraud, created resentment and unrest which in turn generated anti-alienation movements led by Ambarsing Suratwanti and others in Dhule district and Kaluram Dodhade and others in Thane district.[2] Questions were also raised in the legislature.

The Government of Maharashtra appointed a committee on March 16, 1971 to examine the difficulties experienced by Scheduled Tribes landholders/cultivators in respect of their lands in the working of certain provisions of the land revenue laws, tenancy laws, Consolidation of Holdings Act, etc, and to make recommendations to the government as to how best their interest could be safeguarded. (Government Resolution, No REV 1070/62448/C dated March 16, 1971.) H G Vartak, the then Minister for Revenue, was appointed chairman of the Committee. The Committee did full justice to its task, and submitted its report to the government on April 7, 1972. It is clear from the report that the Committee reviewed the effects of several laws relating to agricultural lands on Adivasi landholders.

The Committee found that the protection given under the existing legal provisions to Adivasi landholders was not adequate. There were numerous cases of transfer of Adivasi occupancies in clear violation of laws. There were also numerous cases of transfers effected by taking advantage of loopholes in the existing laws. For example, in some cases the lands were first allowed to be leased out to non-Adivasis by the Collector or Sub-Divisional Officer on the ground that the tribal landholders were sick and unable to cultivate the lands. Medical certificates were also produced. After obtaining the lease, the non-Adivasi tenants applied to the tenancy court for getting the price of the land fixed as they became deemed purchasers under the tenancy law. Thus very clever misuse was made by the non-Adivasi rich to get hold of lands held by Adivasis. The Committee found 28 cases of these types n Nandurbar tehsil of Dhule district alone.

Under the then (that is before the amendment of 1974) existing provisions of sub-section 2 of the Section 36 of the Maharashtra Land Revenue Code (41 of 1966), occupancies held by the Adivasis were not transferable except with the previous sanction of the Collector. The Committee found that such permission to transfer occupancies was "given by the Collectors rather freely".

The Committee made two recommendations. The first was to make a law to provide for strict prohibition of transfer of lands held by Adivasis to non-Adivasis and also to provide for the restoration of lands alienated in violation of the existing legal provisions. The second was to enact a special law for the restoration of lands transferred under several provisions of law.

The government took two years to implement the recommendations of the Committee. The government issued an Ordinance called the Maharashtra Land Revenue Code and Tenancy Laws (Amendment) Ordinance, 1974, on July 6, 1974 to prohibit the transfer of lands held by Adivasis to non-Adivasis and restore lands transferred in contravention of legal provisions (Maharashtra Ordinance 13 of 1974).

The Ordinance was duly presented to the legislature and became an Act (Act 35/1974). The Act made several provisions to restrict the transfer of lands held by Adivasis. It also laid down that transfers in contravention of these provisions would be invalid. The Act also made important provisions to restore lands transferred to non-Adivasis in contravention of laws in force to the original Adivasi landholders. On the whole, the Act has been implemented properly.[3]

### THE ACT

To implement the second recommendation of the Committee to make a law to restore the lands alienated under the laws in force, the Government of Maharashtra introduced a bill in the Assembly on August 23, 1974 under the title "bill to provide for the restoration of certain lands to persons belonging to the Scheduled Tribes" (Assembly Bill 81 of 1974). It was mentioned in the preamble to the Bill that the government, after considering the recommendations of the Committee, felt that "steps should be taken *forthwith* for restoring certain lands to persons belonging to Scheduled Tribes" (emphasis added). The Bill was passed by the Assembly on August 30, 1974. It was introduced and passed in the Legislative Council on September 3, 1974.[4]

The radical nature of the Bill was emphasised by the Revenue Minister H G Vartak who moved the Bill in the Council. In his speech he pointed out that the Bill was a major part of the attempt of the state government to promote social justice. It sought to restore at a small price legally alienated Adivasis' lands. The government would do its best to restore lands to the Adivasis. If necessary, special officers would be appointed to implement it. The Minister regretted that newspapers had not given enough publicity to it. The government would try to give the provisions of the Bill wide publicity.[5]

However, it appears that the anxiety of the Government of Maharashtra to take steps forthwith for restoring certain lands belonging to the Adivasis did not receive a prompt response from the Government of India. The bill received the assent of the President after a number of months on April 28, 1975 and that too after the issue had been raised in newspapers.[6]

A notification was issued and the Act came into force on November 1, 1975 (Act 14, 1975). Later on the Act was included in the 9th schedule of the Constitution of India to ensure that it was not challenged for violating the right to property. (Constitution of India (40th Amendment) Act, 1976.)

This, however, did not save it from being challenged under other articles of the Constitution. Stay orders against the implementation of the Act were issued by the High Court and the Supreme Court.

One can understand the resentment of the non-Adivasi landholders who were likely to lose their occupancies because of the Act. It is, however, surprising to find two social scientists from the Tata Institute of Social Sciences calling the Act an attempt to weaken the foundation of democracy. A National Seminar on Land Alienation and Land Restoration in Tribal Areas was organised by the Tata Institute of Social Sciences at Bombay in June 1976. It was attended by officers of the rank of Collector and above. The papers submitted to this seminar have been published under the editorship of S N Dubey and Ratna Murdia of the Institute.[7] A critical review of the papers has also been published.[8]

One of the papers in the book dealing with the problem of land alienation in Maharashtra is based on analysis of data specially collected for the purpose by Dubey and Murdia, the organisers of the seminar and the editors of the book. The quality of the paper has beeen discussed in the author's review of this book and these comments need not be repeated here.[9] What needs discussion is the attitude of social scientists towards the Restoration Act and their comments on it. Dubey and Murdia write that "the existing land enactments protecting the interests of the tribals in the state raise an *issue of unfair and inequitable treatment to non-tribal transferees*" (p 52, emphasis added). They have raised two objections to the Ordinance issued on July 6, 1974. The first is that " the Ordinance provides for the restoration of the *illegally* transferred lands to the tribals *without compensation* for any expenditure incurred by the non-tribal transferees on the development of such lands" (p 52, emphasis added). Dubey and Murdia have apparently not taken a note of the words *illegally transferred*. No one can claim compensation for the improvements on land *illegally* occupied. On the contrary compensation should be provided to the original landholders for the period of illegal occupancy of these lands. The contention that "if these lands are taken away from them *without payment for these and other improvements, this would be unfair and inequitable*" cannot be called fair (p 53, emphasis added).

The authors also lament that "the Ordinance does not provide for the repayment of any portion of the loan against which the land was mortaged or sold to the non-tribal as a part of the restoration deal". The authors fail to understand that the restoration under the Ordinance is limited only to illegally transferred lands. No law can take note of any invalid loan and provide for its repayment.

They also state that the socio-economic condition of a sizeable number of non-tribal transferees, most often, is hardly above the survival level. Recovery of land from them would leave them economically weak and drive them below the poverty level (p 53). This argument also cannot be accepted. The survey conducted by the authors indicates that over 50 per cent of the Adivasi transferors had less than Rs 500 as annual income and all (except four persons who did not answer the question) had an annual income below Rs 5,000. So far as non-tribal transferees are concerned about 28 per cent had an annual income of Rs 5,000 and above. It is also significant to note that nearly 16 per cent of the transferees refused to disclose their incomes. In these circumstances it is difficult to maintain that the non-tribal transferees, compared to the tribal transferors, were economically weak. Dubey and Murdia rightly state that "the main rationale behind the policy of not paying compensation to non-tribals is that they usurped the land mischievously and contrary to the provisions of the law" and yet strangely plead that the human aspect of the situation should not be overlooked.

Dubey and Murdia in their review of papers submitted to the seminar maintain that "the rationale behind the retroactive application of legislative provisions relating to the restoration of tribal lands rests on the arguments that the transferees have broken the law and should suffer the consequences there of and that since transferees are well-to-do, restoration will not hurt them." They reject both these assumptions and condemn the punitive nature of the retroactive application of the law. According to them "laws enacted retroactively may breed contempt for and a sense of disillusionment with the social and political systems among the people, *and may well erode the foundations on which our well intentioned political leaders are vigorously trying to build the edifice of a new social and economic order*". Coming from social scientists the argument, to say the least, is strange and untenable. One wishes that they had realised that an edifice of a new social and economic order cannot be built without attacking the bastions of illegitimately accumulated wealth and power. Those who exploited the Adivasis may feel highly discriminated against and Dubey and Murdia appear to be on their side. They appear to be innocent of the principles and practice of social justice. Their views are in sharp contrast to the views expressed in the judgment upholding the validity of Act described in the latter part of this paper.

### MAIN PROVISIONS

The major provision of the Act is that where due to transfer (a) the land by a tribal transferor is held by a non-tribal transferee, or (b) the land acquired in exchange by a tribal transferor is less in value than the value of the land given in exchange, and the land so transferred is in possession of the non-tribal transferee, and has not been put to any non-agricultural use on or before July 6, 1974, then, notwithstanding anything contained in any other law for the time being in force, or any judgment, decree or order of any Court, Tribunal or authority, the Collector, either *suo moto* at any time, or on the application of a Tribal transferor made within three years from the commencement of the Act shall, after making such inquiry as he thinks fit, direct that (1) the lands of the Tribal transferor and non-tribal transferee so exchanged shall be restored to each other. Land transfers include transer of lands belonging to a tribal made in favour of a non-tribal during the period commencing on April 1, 1957 and ending on July 6, 1974 either by way of sale, gift, exchange, mortgage or lease or any other disposition made *inter-vivos* or under decree or order of a court or sold in auction for the recovery of land revenue or similar arrears or under the Maharashtra Co-operative Societies Act, 1960.

It has been clarified that the terms tribal transferor and non-tribal transferee include their successor-in-interest. Provision has been made to assess the value of improvements made on the land by the non-tribal transferee and for the payment of such value to him by the tribal transferor. It has also been made clear that the tribal transferor shall be entitled to restoration of land only if he undertakes to cultivate the land personally and to pay for the improvements made thereon as recommended by the Collector. The procedure for calculating the value of improvements is also laid down. In the case of sale of lands, in addition to the value of improvements, if any, the tribal transferor must pay to the non-tribal transferee an amount equal to 48 times the assessment of the land or the amount of consideration paid by the non-tribal transferee for acquisition of the land whichever is less. The amounts are to be paid in lump sum or in such annual instalments not exceeding twelve (with simple interest at 4.5 per cent per annum) as the Collector may direct.

It has already been pointed out that in a number of cases non-Adivasis purchased or took on lease the lands held by Adivasis and became rightful owners under the Bombay Tenancy And Agricultural Lands Act amended in 1956. The tenants acquired the right to purchase the land on April 1, 1957. The transactions were legal. Special provisions have been made for the restoration of lands purchased, or deemed to have been purchased or acquired under the provisions of this amendment. The Collector has been empowered to restore the lands transferred under tenancy laws from April 1, 1957 and before July 6, 1974 under certain conditions. However, the lands put to non-agricultural use on or before July 6, 1974 shall not be restored. The tribal transferor shall have to pay the amount of purchase price paid by the non-tribal transferee.

In a number of cases, Adivasis are put under pressure not to accept the lands to be restored to them. A special provision is, therefore, made to vest the ownership of such lands in government, subject to the payment of purchase price and the value of improvements. The lands so vested shall be granted to any other tribal residing in the village in which the land is situated or within five kilometers thereof and who is willing to accept the land in accordance with the provisions of the Code and the Rules and to undertake to cultivate it personally.

An appeal against any decision or order passed by the Collector under this Act can be made to the Maharashtra Revenue

2 [illegible]

Tribunal. No pleader shall be entitled to appear on behalf of any party in any proceeding under this Act before the Collector or the Commissioner or the Maharashtra Revenue Tribunal. However, where a party is a minor or lunatic or any other person under disability his guardian or authorised agent may appear in such proceedings. The jurisdiction of the civil courts is barred for cases under this Act.

In short, the Act makes provisions for the restoration of lands held by the non-tribal transferees to tribal transferors. The provisions are quite wide and the transfers covered thereunder include transactions of sale, gift, exchange, mortgage, lease or oral dispositions as well as transfers made under decrees of courts and under the provisions of tenancy laws made between April 1, 1957 and July 6, 1974.

No wonder that the non-tribal transferees were shocked by the provisions of this Act. They did everything to thwart the implementation of the Act. Stay orders were obtained from the Bombay High Court and later on the Supreme Court. The government was forced to issue instructions not to implement the provisions of the Act. The Government of Maharashtra, in April 1977, issued a circular asking for the halting of action under the Act. However, it must be pointed out that the Act was placed in the 9th Schedule of the Constitution to make it immune under Article 31-B from any challenge on the ground that it is inconsistent with any of the rights confirmed by Article 14, Article 19 or Article 31 of the Constitution.

### SUPREME COURT JUDGMENT

Finally, a three-member bench of the Supreme Court upheld the validity of the Act on December 4, 1984.[10] The judgment is unique in many respects and reflects the present attitude of the Supreme Court towards social justice. It is necessary to describe the main objections raised against the provisions of the Act and the decision of the Supreme Court thereon at some length.

It was contended that the provisions of the Act which provide for the annulment of transfers of lands by tribals to non-tribals during the specified period and for restoration of possession to them are beyond the legislative competence of the state under entry 18 in List II of the 7th Schedule. List II of the 7th Schedule gives the subjects within the legislative jurisdiction of the state and entry 18 covers land and rights in or over land, etc. It was contended that the state has no power under the entry to unsettle titles vested validly in the non-tribal transferees. The Supreme Court rejected the contention stating that the transfers of lands between tribals and non-tribals were based on unequal bargains. The Act does not involve any deprivation of the property in the sense that there is unsettling of title without consideration. There are provisions for the repayment of the purchase price and payment of the cost of improvements. The Act, in its true nature and character, is a law relating to transfer and alienation of agricultural lands by members of Scheduled Tribes to persons not belonging to Scheduled Tribes and falls within entry 18 of List II.

The learned judges also pointed out that the Act was placed in the 9th Schedule of the Constitution and could not be challenged on the ground that it violated any of the fundamental rights conferred by Article 14, Article 19 or Article 31 of the Constitution.

It was contended that the adoption of the date April 1, 1957 from which the period of annulment of transfers started was arbitrary. The Supreme Court rejected this contention and remarked that April 1, 1957 had not been selected arbitrarily as it was the day declared as tillers' day on which the tenants were deemed to have purchased the lands.

It was also contended that the Act was applicable only to the members of the Scheduled Tribes and this was discrimination against the members of the Scheduled Castes who also constitutes a part of the weaker sections of society. This was a breach of the principle of equality before law or equal protection of the laws to all as laid down in Article 14. The Supreme Court rejected this argument on two grounds: first, the appellants were not members of the Scheduled Castes and could not plead their cause; secondly, tribals constitute a distinct class who need special protection of the state.

It was also argued that preferential treatment was given to non-tribal transferees who had diverted the lands purchased to non-agricultural purposes and this violated equal protection of the laws. The Supreme Court rejected this on the ground that the state was correct in excluding non-agricultural lands that did not come under entry 18 in List II.

It was also argued that Section 9-A of the Act which lays down that no pleader shall be entitled to appear on behalf of any party in any proceedings under the Act before the Collector, Commissioner or the Maharashtra Revenue Tribunal amounted to an unreasonable restriction on the right to acquire, hold and dispose of property guaranteed under Article 19(1)(f) as there is denial of opportunity to the non-tribal transferees to be represented by a lawyer of their choice in the proceedings under the Act. The Supreme Court pointed out that the Act was placed in the 9th Schedule of the Constitution and could not be challenged for the violation of rights under Article 19 (1)(f).

The contention that this section in the Act violated the right to practice any profession or carry on any occupation, trade or business guaranteed under Article 19(1)(g) was also rejected by the Court. The Court refused to accept the contention that the advocate enrolled under the Advocates Act, 1961 has an absolute right to practice before all courts and tribunals. The right is subject to the provisions of law. The Constitution does not give a litigant a fundamental right to be represented by a lawyer in any court. The object of the section is to avoid delay in proceedings, which is quite justifiable.

Thus, the Supreme Court rejected all the technical-legal objections against the provisions of the Act. However, the important part of the judgment is the views expressed by the learned judges on redistributive social justice.

The learned judges pinpointed the peculiarity of the Act as follows: "Although there is a legislation undertaken by different states placing restrictions on transfer of lands by members of Scheduled Castes and Tribes in pursuance of the declared policy of the state of safeguarding, protecting and improving the conditions of weaker sections of the society by providing that any such transfer except in terms of the provisions of the different acts shall be null and void, the State of Maharashtra has *gone a step further for annulment of such transfers* by the members of Scheduled Tribes *and for restoration of lands to them* by enacting the Maharashtra Restoration of lands to Scheduled Tribes Act" (para 4, emphasis added). The learned judges also took note of the reasons for enacting such legislation that were laid down in the Report of the Committee appointed to study the working of the laws relating to the land held by Adivasis.

The Bench also observed that "under the scheme of the constitution, the Scheduled Tribes as a class require special protection against exploitation. The very existence of Scheduled Tribes as a distinctive class and the preservation of their culture and way of life based as it is upon agriculture which is inextricably linked with ownership of land, requires preventing an invasion upon their lands . . . One has only to look at the artlessness, the total lack of guile, the ignorance and the innocence, the helplessness, the economic and the educational backwardness of the tribals pitted against the artful, usurious, greedy land-grabber and exploiter invading the tribal area from outside to realise the urgency of the need for special protection for the tribals if they are to survive and to enjoy the benefits of belonging to the 'Sovereign, Socialist, Secular, Democratic Republic' which was vowed to secure to its citizens 'justice, social, economic and political', assuring the dignity of the individual."

The Bench has clarified the concept of distributive justice in very clear terms. "The concept of distributive justice in the sphere of law-making connotes, *inter alia*, the removal of economic inequalities and rectifying the injustice resulting from dealings or transactions between unequals in society. Law should be used as an instrument of distributive justice to achieve fair division of wealth among the members of society based upon the principle: 'from each according to his capacity to each according to his needs'. Distributive justice comprehends more than achieving lessening of inequalities by differential taxation, giving debt relief or distribution of property owned by one to many who have none by imposing ceiling on holdings, both agricultural and urban or by direct regulation of contractual transactions by forbidding certain transactions and, perhaps, by requiring others. *It also means that those who have been deprived of their properties by unconscionable bargains should be restored their property. All such laws may take the firm of forced redistribution of wealth as a means of achieving a fair division of material resources among the members of society or there may be legislative control on unfair agreements*" (para 16, emphasis added).

It is very gratifying to note the just, pragmatic and progressive views adopted by the learned judges in sharp contrast with the views of some social scientists mentioned earlier. The judgment will be a landmark in the history of socially progressive legislation in the country.

### IMPLEMENTATION, THE TEST

It is now the duty of the Government of Maharashtra to implement the provisions of the Act by appointing special officers to inquire into cases of alienation and to take steps for the restoration of lands to Adivasis. The Act laid down a limit of three years from the commencement of the Act for the tribal transferors to apply for restoration. Due to various stay orders and the circular of the government mentioned above, the majority of the transferors have not applied for restoration. The government would, therefore, do well to extend the time-limit to give opportunity to put in fresh applications.

The Act lays down that the government can *suo moto* at any time inquire into the cases of land alienation and take measures of restoration. It has already been pointed out that the government had assured on the floor of the legislature that it would appoint Special Officers and do its best to implement the provisions of the Act. Now that the Act has been cleared by the Supreme Court, the government can keep up its words, provided it has the political will to do so. It is to be seen whether the government has this political will or allows implications of the Act to go by default. Activists are already moving to urge the government to take steps to implement the provisions of the Act. It is to be seen whether the members of Legislature in general and members belonging to the Scheduled Tribes in particular take up the issue or not. This is an acid test of the political will of the government, the alertness of the members of the Legislature and the effectiveness of the social activists working among Adivasis in Maharashtra.

### Notes

1 The process of alienation of Adivasis' lands in Maharashtra have been described in S D Kulkarni, 'Over a Century of Tyranny', *EPW*, March 9, 1974; 'Alienation of Adivasis Lands', *EPW*, August 31, 1974 and 'Alienation and Restoration of Adivasis Lands in Maharashtra' in K S Singh (ed) "Economies of the Tribes and Their Transformation", New Delhi, Concept Publising House, 1982.

2 These movements have been described in several works like (a) S D Kulkarni, 'The Bhil Movement in the Dhulia District' in K S Singh (ed) "Tribal Movements in India", Vol II, New Delhi, Manohar, 1983, pp 261-71.

# Violence with a Difference

**Sudarshan Iyengar**

**Sujata Patel**

THE people of Ahmedabad are frightened and the city which was known for its peace and quiet has today become a city of violence. Shops are being burnt, property is being destroyed and human beings are exposed to gruesome attacks. Since the first phase of violence from March 18 to 20 the city has witnessed organised and planned attacks, retaliations and counter-attacks. In the process, latent communal and caste feelings have crystallised. Today deep schisms exist in the city between Hindus and Muslims, Patels and Kshatriyas and Savarnas and scheduled castes. These schisms have developed in the last four months directly as a result of the manner in which the government has reacted to the nascent anti-reservation agitation. The opposition parties were not far behind and they took the lead in exacerbating the situation and encouraing the forces that were ranged against the government. Even the army which has been in the city continuously since mid-April now finds it difficult to control the situation. The violence has spread to Baroda, Surat, Nadiad, Anand, Viramgam, Kadi, Kalol and Mehsana.

As reported in these columns earlier (April 20 and 27) the anti-reservation agitation grew in an atmosphere which was strongly anti-scheduled caste, an atmosphere that had been built up during the 1981 anti-reservation agitation. The issue this time was reservation of seats for the backward castes and the agitation was directed against the backward castes. The agitation and the violence would not have manifested itself in such an ugly form had the ruling group within the Congress(I) not used anti-social elements against the agitation. The use of criminal elements (given that the key leaders among them belonged to one community) led to communal tension in the city, ultimately rendering homeless more than 30,000 poor persons living in slums. The use of force by the police led to increase in anti-government feeling and ultimately the collapse of confidence in the authority of the state. An anarchic situation came to prevail.

There have been four phases of violence: March 18 to 24, April 15 to 26, May 7 to 15 and June 7 to 11.

The second phase of violence, as we noted in our earlier report, had been the outcome of the confrontationist postures of the government and the anti-reservationists. The government used a section of the police force which was close to the ruling group in the Congress(I) and which belonged to the backward castes to harass people supporting the agitation. The opposition took full advantage of this. It made it into a civil liberties issue and approached the judiciary. The regional media, which had all along shown strong pro-agitation sympathies, set out to expose the police atrocities in great detail. The newspapers have consistently shown an upper caste and pro-majority community bias. The atrocities committed against minorities and scheduled castes have not received attention and coverage. The petitions filed by the anti-reservationists restricted the movements of two police officers belonging to the backward castes. The latent caste feelings within the police surfaced and this demoralised the police force.

When a police constable was attacked and killed on April 22 near Chabhila Hanuman in Khadia, where a committee set up by the Gujarat High Court to inquire into police atrocities was carrying out investigations, the faction-ridden police force went on a flash strike, laying down arms. Curiously, the strike was encouraged by both the supporters of the anti-reservation agitation as well as by the pro-backward caste faction within the police. The latter was angered by what it considered 'biased' reporting of the activities of the police while the former encouraged the strike in order to give a jolt to the government. Police personnel in uniform and in mufti gathered from all parts of the city and the atmosphere on the afternoon of April 22 was charged with tension. The enraged policemen indulged in arson and looting and mercilessly beat up people. Anti-social elements took full advantage of this breakdown in law and order and indulged in looting and destruction of private and public property. The orgy of violence reached its height with the systematic attack on the Gujarati daily, *Gujarat Samachar*. Exploiting the situation, certain groups attacked Muslims and scheduled castes living in different parts of the city. In Ambedkar Nagar 200 huts of scheduled castes were razed to the ground and the inhabitants were severely beaten up with the help of the police. In Bapunagar, again with the aid of the police and anti-social elements, upper caste people of neighbouring housing societies attacked Muslims. Between the evening of April 22 and the next morning, at least 500 houses in the slums of Indiragarib Nagar and Sanjaynagar were looted and set on fire, displacing three to five thousand people. Unofficial sources put the death toll in police firing and group clashes at 50. In Narayanpura some houses of well-to-do upper caste people were attacked by scheduled caste groups.

By the beginning of the second phase of violence, the Bharatiya Janata Party seemed to be in command. Its power base, Khadia, became the centre of activity. The party was able to mobilise women to thwart attempts by the police to carry out searches, etc. The military, though within reach, was called only after some sections of the city police became relatively inactive from April 18 after the High Court set up a committee to look into allegations of police atrocities. Even when the military was summoned, it was not allowed to take full command. It was asked to aid the local police in restoring law and order. The 'striking' policemen and anti-social elements fully used the opportunity to settle scores.

In the second phase of violence, according to official figures, more than 200 shops and 700 houses were looted and burnt and about 45 people were killed. Stabbings continued unchecked, jeopardising the safety of pedestrians and people moving on two-wheelers. After a few days, while the trouble in Ahmedabad ebbed, cities and towns of north and south Gujarat were gripped by violence. Kutch and Saurashtra were, however, relatively peaceful.

The third phase of violence began in Ahmedabad when sub-inspector Rana was riddled with bullets in Bhanderi Pole in the Kalupur area of the walled city. Before that Gandhinagar, the state capital, had been the scene of conflict between the striking employees and the state government. The employees had gone on strike in support of their demand for publication and implementation of the recommendations of the Sadhwani Commission which was set up to streamline the roaster and promotion system for government employees. The strike paralysed the government administration in two to three days. Some opposition party leaders started a fast unto death for the removal of the Solanki ministry. By now there were also manifest communal tensions in Ahmedabad, specially in the Muslim pockets of Dariapur, Kalupur, Bapunagar and Saraspur.

With the killing of sub-inspector Rana in the Kalupur area, where communal feelings were running high, the agitationists who had till then been condemning police atrocities suddenly started applauding the role of the police in protecting Hindu lives and property. This further fanned communal feelings in the city and led to a series of violent events in Kalupur, Dariapur and the labour areas of Saraspur, Bapunagar and parts of Narayanpura. The attacks were directed against Muslims and their houses and shops. In Narayanpura Muslim autorickshaw drivers were individually identified and beaten up and one of them burnt to death in his rickshaw. In Saraspur some 200 Muslim huts were razed to the ground and in Bapunagar upper caste Hindus destroyed what had remained unburnt in April.

The government showed its concern over the happenings in the city in a typical manner. It armed itself with repressive measures, started combing operations and made a few arrests. It promulgated the Gujarat Prevention of Anti-Social Activities Ordinance which gave the government extraordinary powers to detain any alleged offender for a year without legal procedures. The declaration of the ordinance was preceded by a shake up of the police administration. The combing operations and arrests were, however, merely a facade to legitimise promulgation of the anti-democratic ordinance. A police officer admitted in an interview that those responsible for the violence were not to be arrested.

Chaos and anarchy ruled in Ahmedabad. The agitation leaders were not willing to discuss matters with the government, nor did the striking government employees show any signs of withdrawing their strike. On the other hand, the government refused to give up its strategy of mobilising one group of people against another. The army was not given total command and had to play second-fiddle to the police which had actively encouraged communal attacks. The government and some elements in the police clearly did not want to hand over full power to the army. The agitationists and the government did meet for talks in the middle of May but the talks failed. A second round of talks on May 31 also failed. After the failure of the second round, the agitationists got a boost from the city's trading community which declared a five-day 'bandh' in protest against the violence. The agitationists gave a call for a Gujarat 'bandh' on June 7.

Tension mounted in Ahmedabad and violence erupted once again in the Dariapur-Kalupur areas. This area had been the scene of conflict two-and-a-half months back. Clashes took place on June 7. It was organised violence. The attackers were armed to the teeth. Houses in Dabgarwad were attacked once again and a family of eight Dabgars was burnt to death. (Dabgars are Hindus whose traditional occupation is making drums and umbrellas.) Some people stopped the fire brigade from extinguishing the fire. When the army arrived, one miscreant tried to knife a jawan and was shot dead. The army resorted to firing and unofficial reports say that at least 42 bodies of persons killed in firing, arson and stabbings were brought to the Vadilal Sarabhai Municipal Hospital on a single day, June 8.

The government's announcement conceding three of the demands of the agitationists did not pacify the agitationists. It is now very clear that the agitationists wanted the ouster of Chief Minister Madhavsinh Solanki. A faction of the Congress(I), led by Jeenabhai Darji, started showing open signs of rebellion and in this it has been joined by some voluntary groups. Another faction of the Congress(I), it is believed with the support of Solanki himself, has been encouraging the Kshatriyas to organise themselves and take a more aggressive stance.

The violence in Gujarat has been different from that in other states such as Assam and Punjab. There is no mass movement in Gujarat like the one in Assam nor is there organised terrorism as in Punjab. While some caste clashes have taken place in Mehsana and Kheda districts, the caste war has not spread all over Gujarat. The violence has been organised by two opposing political groups: the Solanki-led Congress(I) and the opposition-led anti-reservationists. Both have used communal violence to score political points against the other. The violence has thus emerged out of political tensions and that is why the violence, despite the fact that it has lasted so long, remains localised and restricted and has not turned into a full-scale caste or communal carnage.

*June 27.*

# US-Japan Trade Relations

### David L Schulze

THE American merchandise trade deficit with Japan grew from US $ 9.9 billion in 1980 to US $ 19.4 billion in 1983. It nearly doubled in 1984, reached US $ 37 billion. The size of the deficit as well as its rapid growth, has created a situation that threatens good relations between the US and Japan. Both countries feel wronged by the other. The US blames the deficit on Japanese barriers to its domestic markets. The Japanese blame the deficit on American mismanagement of its economy—huge budget deficits and high domestic interest rates result in a grossly overvalued American dollar. The overvalued dollar makes American imports relatively inexpensive, while American exports find themselves priced out of many overseas markets. Many Japanese feel that they are being made the scapegoat for American domestic economic policy failures.

The root causes of the current situation go back to World War II. By the end of the war, the Japanese industrial structure—plant, equipment, transportation network, etc—had been essentially wiped out. Within thirty-five years of the end of the war, Japan became the world's second largest economy. An essential ingredient in this amazing reconstruction was the strong protectionism fostered by the Ministry of International Trade and Industry. A series of tariff and non-tariff barriers kept more competitive American and other foreign goods out. Similar policies restricted foreign investment in Japan. The man in the street was indoctrinated with the view that selling to foreigners and buying Japanese produced goods was a civic responsibility.

Japan has been under pressure from its trading partners since the early 1970s to open its markets to foreign goods. Over this period, her tariff and non-tariff barriers to trade have been lowered. The Japanese claim the process of opening their economy is essentially finished; Americans, Europeans, and many members of ASEAN claim that substantial barriers still remain. Where does the truth lie?

In the first place, the American argument that the sizeable trade deficit is, itself, evidence that Japan's markets are closed to US goods must be rejected. There are several reasons for this conclusion. First, Japanese purchases of American goods are substantial—over US $ 22 billion in 1983 which exceeded US exports to West Germany, France and Italy combined. Japan is the second largest importer of American goods (after Canada). Second, this argument ignores the effects of the overvalued US dollar on American imports and exports. Third, at the same time the Japanese economy was becoming more open, the trade deficit grew dramatically. Additionally, the trade deficit with Japan has declined as a proportion of the total US trade deficit. The $ 15.8 billion deficit in 1981 was 60 per cent of America's total trade deficit, while the $ 37 billion deficit last year was only about one-third of the total deficit. Fourth, it ignores completely the price and quality advantages that many Japanese products have over their American counterparts. Lastly, Japanese firms, on the whole, have tried harder to design and market their products to suit American tastes and culture than have American firms attempting to sell in Japan.

Japanese claims that the process of dismantling her protectionist barriers is completed must also be rejected. Japanese protectionism has been a cause, although perhaps not the major causes, of the US trade deficit. There is ample evidence to support this point of view. First, a comparison of the patterns of Japanese trade with other industrialised countries is quite revealing. From 1960 to 1980 the ratio of imports of manufactured goods to Gross National Product for the US, France, West Germany, and the UK increased dramatically, at least doubling for most of the countries. The Japanese ratio (2 per cent) was the lowest and remained constant over the entire 20 years. This certainly suggests an effective policy of restricting imports of manufactured goods. Second, although Japanese tariffs, on the average, are lower than those in the US and Western Europe, there are important tariff barriers in specific markets, for example, wood and paper products, agricultural machinery, alcholic beverages and wine. Third, there are many non-tariff barriers to trade including quotas on beef, citrus and cigarettes; complicated customs procedures; a refusal to accept foreign safety certification of products; etc. Finally, other countries perceive similar problems in their trade with Japan. For example, Taiwan temporarily barred the importation of 1,500 Japanese products in 1982 in retaliation for what it claimed were Japanese barriers to imports from Taiwan.

The Japanese government has recently implemented a series of recommendations made by its Advisory Committee for External Economic Issues. They are designed to improve access to domestic markets by encouraging imports, liberalise the domestic financial and capital markets, promote mutual investment and other objectives. As announced by the Ministerial Conference for Economic Measures on April 9, 1985, these measures include advanced implementation of the tariff reductions negotiated in the Tokyo Round Agreements, acceptance of foreign clinical test data for medical equipment, improving import conditions by providing import finance by the Export-Import Bank of Japan, lowering the Export-Import Bank of Japan's interest rate on loans to finance the importation of manufactured goods, import financing to purchase foreign communications satellites, licensing foreign banks to conduct a wider range of banking activities, as well as the widely publicised efforts to encourage Japanese to buy more imported goods.

There are several features of the domestic Japanese economy that, while not protectionist in the ordinary sense of the word, give Japanese firms a competitive edge. Japan has the highest domestic savings rate of any industrialised country. This provides a huge pool of funds for investment purposes since borrowing to finance consumption purchases is discouraged. As a result, domestic interest rates are low, certainly much lower than in the US. At the same time, Japanese firms rely much more on borrowed funds for expansion than do US firms. Consequently, Japanese firms can finance their growth with much lower profit margins. This gives them the ability to charge lower prices than their American competitors, even if their production costs are the same. The yen is undervalued. This is not the result of direct government exchange rate policy. It is caused by low domestic interest rates (or high US interest rates), as well as Japanese restrictions on capital inflows. An undervalued yen boosts Japanese exports.

Americans believe that fair trade is a precondition for free trade. Many think that Japanese trade barriers are a major cause of the US trade deficit. While this view is substantially incorrect, it does contain an element of truth. Pressure for retaliation against Japan is growing. The US Senate recently voted 92-0 in favour of a resolution calling on President Reagan to 'obtain the elimination' of Japanese practices that are viewed as unfair.

There has always been a strong isolationist element in the US. If the growth of the American economy slows further and unemployment remains high, there is a very real chance that Congress will vote retaliatory measures against Japan. The longer nothing is done to cure the basic disease—the huge budget deficits in the US—the more likely are attempts to treat the symptoms. Such treatment will only make the patient worse, in this case by precipitating a trade war with Japan.

The consequences of such ill-advised, short-sighted action would be disastrous, for not only the Japanese and American people, but the whole system of world trade.

# The Rents of Misdelivery

## A Case for Modernisation of Industrial Planning

R K Hazari

**Industrial Growth in India: Stagnation since the Mid-Sixties** by Isher Judge Ahluwalia; Oxford University Press, Delhi, 1985; pp xxii + 235, Rs 120.

STUDIES in agricultural economics in India have been abundant as well as productive. That is not the only or major reason for the success of the green revolution but it has helped. Industrial economics has been sadly neglected: those who know the facts do not or cannot conceptualise and write; those who can study, generally, do not care to feel the knots in the rope. Agriculture, it is true, is subject to the ravages of nature but, cultivation of opium and release of canal water excepted, each link in its chain of activity does not require sustained government intervention. Industry is more autonomous of nature but less immune against the interests and whims of a broad spectrum of the human species, ranging from owners, managers, traders and workmen to regulators and tax gatherers, some of them benevolent microbes, others fractious pests. One of the great virtues of capitalism, "the greatest revolution in the history of mankind", was to sweep away the feudal and mercantilist restrictions on the mobility of persons and goods and to substitute expanding horizons in place of narrow minds and markets and official policies. That the expanding horizons would benefit some, more than others, was inevitable, so came wars, deeper internal conflicts (or "contradictions")—and regulations, especially in those societies which preferred vegetarian solutions for conflicts.

In the great melting point that India, whether fragmented or united, has always been, the synthesis of Fabian, Leninist and Gandhian ideas from the nineteen twenties till the seventies has identified modernisation with regulation, positive and negative, in varying proportions. The tale of industry, which along with social reform and education is the principal engine of modernisation, is full of regulation, on the whole, positive till the mid-sixties, generally negative since then, with textiles bearing the full brunt of negativism right through. In the fifties, the flowering of the vision of Jawaharlal Nehru through the 'yes and more' attitude of T T Krishnamachari and Manubhai Shah moved the public sector towards the commanding heights of the economy and encouraged the private sector in industry to pick up the opportunities that came its way. Then came the foreign exchange crisis with its backlash of import substitution regardless of cost and, simultaneously, a sense of unease with the distribution of benefits of growth. Soon thereafter, the conflict with China and later with Pakistan eroded the availability of domestic and foreign resources for further growth of public investment. The plan holiday which commenced during the regime of Lal Bahadur Shastri was partly deliberate: Lal Bahadur did not really care for planning, the tired bureaucracy desired consolidation, ambitious businessmen wanted respite from a fast growing public sector with what they understood as its tax and political implications, the rest of the elite wished to deviate from Nehru's daydreams or to concentrate on agriculture when the country's vulnerability in respect of food supply became prominent.

### RITUALISED PLANNING

When plan rituals were resumed after three annual plans, the vision was missing and the focus was on populist stepping up of the nominal size of the outlay from year to year and plan to plan. There came to be a vicious circle of poor management of and inadequate investment in infrastructure (mainly railways and power) and heavy industry: low returns followed and chased unstable inefficient political and industrial managements. Regulation became a tedious means of saying 'no or less' or worse, piling of new controls on top of old, reminiscent in many ways of mercantilist internal economic policies. The commanding heights came to be perceived more as sources of erosion than irrigation. Small alone was beautiful in the perception of small minds. Petroleum became more glamorous than hydel power. The intellectual armoury of planning stood depleted: nothing comparable with the elegant, syncretic Mahalanobis plan-frame was essayed after the mid-fifties, notwithstanding massive expansion of the economist population and the widely perceived misconceptions and inadequacies of the historic Mahalanobis exercise. No effort was made in particular to harmonise physical planning with changing relative prices, improving productivity and sophisticated financial planning. Shortages of food, domestic savings and foreign exchange were the favourite quick explanations for sluggish growth; when these constraints loosened or disappeared—and the euphoria in nationalised commercial banking died away—there were no excuses left. The level and extent of poverty aroused justifiable concern with the growth rate and the systems of public management but, apart from ritualistic obeisance to populist gestures, which directly expanded consumption rather than investment and enlarged the bureaucracy more than they contributed towards productivity, there was little attention to the mechanisms of growth leverage.

Almost equally pathetic has been the state of the intellectual delivery system, which has failed to conceive and market new or revised strategies for converting available resources into goods and services consistent with economic efficiency and social justice, on the ground. Much effort has gone into either tautological pedagoguery or, when confronted with policy alternatives, taking refuge in complaints against "faulty implementation of correct policies" and, in effect, opposing any change and modernisation of the policy-frame as if what the founding fathers had laid down was perfect and sacred for all time to come. Even competent professional analysis of available data on infrastructure and industry has been somewhat rare—unless it has been secreted away from public gaze in monastic academe.

There is always hope, nevertheless, especially since the population (of intellectuals too) is growing younger. Isher Judge Ahluwalia's work reinforces that hope. It is by far the best analysis that I have come across of secondary data on industrial economics in India. In fact, it is so good (and so consistent with my own views) that I have been stimulated out of hibernation to write on the subject after almost two decades. The work extensively documents the trends between 1956-57 and 1979-80 in industrial growth and productivity at a detailed level of disaggregation. It provides definitive evidence of a slow-down in the growth of heavy industries since the mid-sixties.[1] The phenomenon of stagnation in industrial growth is associated with evidence of very poor performance in the growth of over-all productivity in the industrial sector, and of increasing capital-output ratios across the board. A thorough examination of the available empirical evidence enables the author to identify four principal factors responsible for this stagnation: the slow-down in public investment after the mid-sixties with its particular impact on infrastructural investment; poor management of the infrastructure sectors; slow growth of agricultural incomes and its effect in limiting the demand for industrial goods; and finally, the industrial policy framework and its effect in creating a high cost industrial structure within the economy. One explanation of the cause of industrial stagnation, namely, that income distribution has worsened over time, is found to have no empirical basis. Another, namely, that shortage of wage-goods has constrained industrial growth, is also invalid. She also analyses the role of import substitution in industrial growth. Her principal conclusion is that the industrial policy framework has stifled industrial growth. What and how, one should go beyond that—how to untie the knots or get a fresh rope—she does not essay.

Let me first attempt a brief summary of Ahluwalia's presentation and then try to see where and how to go from there.

Industry has not stagnated or fallen back. It is the potential generated which has not been fully exploited. We could have done better and are capable of doing better. The industrial base has been substantially widened. Entrepreneurship has been fostered and made more broad-based. Technological capabilities and skills have greatly improved. There have been major successes on the institutional plane such as the development of the public sector to occupy the commanding heights which can provide direction and leadership within a mixed economy framework. The establishment of heavy industries combined with policies favouring import substitution have made a massive contribution towards widening of the industrial base. In the first three Five Year Plans, the target rates of growth for industrial output were 7, 10½ and 10¾ per cent per annum; the achievement was 6, 7¼ and 8 per cent, respectively. After a brave attempt at 12 per cent during the Fourth Plan, the subsequent targets were lowered to 8 per cent but the actual achievement between 1968-69 and 1982-83 was 4.8 per cent, indicating that while capacities were set up in a wide spectrum, the potential offered was not fully exploited.

### 'PRIME IMMOVER' HYPOTHESES

The author examines a number of 'prime immover' hypotheses which have been put forth to explain the slow-down since the mid-sixties. These are:

(a) the drag emanating from the agricultural sector;
(b) a worsening of the distribution of incomes over time and the lack of a broad-based demand from industrial products;
(c) the slow-down of import substitution;
(d) the slow-down in public investment; and
(e) an economic environment which does not permit competition.

The disaggregated data analysed pertain to value added and value of output, both adjusted for price changes. During the five years ended 1965-66, the share of capital goods and basic goods industries in total value added in industry increased from 11 per cent and 27 per cent, respectively, to 15 per cent and 31 per cent, respectively. By contrast, the subsequent decade and a half betrayed a remarkable degree of stability in the structure of the industrial sector. The deceleration of growth in heavy industries was across the board: metal products suffered the largest slow-down, their growth in value added declining from 12 per cent per annum in the first period to 2.5 per cent in the second period. In basic metals and non-metallic minerals, the growth rates slowed down to one-third of their values in the first period. The growth rate in non-electrical machinery was halved. Slow-down was absent only in textiles and food manufacturing but they did not take-off either in the first period.[2]

The National Accounts and ASI data indicate that deceleration was concentrated in heavy industries, but the industrial production data reveal deceleration across the board. The inter-industrial growth pattern varies significantly between the two sets of data. In both sets of data between 1969-70 and 1979-80, chemicals, machinery and beverages appear unequivocally as the relatively fast growing industries and food, tobacco, wood and cork as relatively slow-growing, but the divergence is very marked in certain major industries. In textiles, the production index shows an increase of about 0.5 per cent while ASI records an increase in real value added of over three per cent per annum and in real value of output of almost 4.5 per cent. In transport equipment, the divergence is much greater: the growth rate of industrial production was about zero while real value added and real value of output grew at 5.1 per cent and 6.2 per cent, respectively. The divergence is enormous in footwear: the production index increased at nearly one per cent while real value added and real value of output increased at 12.4 per cent and 13.4 per cent, respectively. The divergences are sharp in leather and fur also.

### 'THE AGRICULTURAL DRAG'

The principal linkage between agriculture and industry is through (i) supply of wage goods, i e, food; (ii) supply of raw materials; and (iii) generation of final demand for industrial goods. A wage goods constraint on industrial growth may arise from slow growth of production/marketed surplus of foodgrains or the net availability of foodgrains. Alternatively, the terms of trade may move in favour of wage goods over time which, in the absence of productivity increases, would squeeze profits and stifle industrial growth. Based on studies conducted by Srinivasan, Alagh and Sharma, and Sawant, the author concludes that food production growth has not slowed down over the two decades ending roughly in 1980. Similarly, in respect of marketed surplus, as a proportion of agricultural production, going by Thamarajakshi, Mody and Kahlon and Tyagi, the trend has been upward. Granted some biases in the data, there was no trend increase or decrease in the per capita net availability of foodgrains. The evidence on terms of trade is less clear-cut because of conflicting views and indices used: going by Kahlon and Tyagi, there has been a declining trend since the mid-sixties in the terms of trade of agriculture *vis-a-vis* non-agriculture.

If the wage-goods constraints were a binding factor, then it should have affected industrial growth across the board, with the largest effect on the most labour-intensive industries. In fact, the slow-down was concentrated in capital goods and basic goods. The author therefore asserts that the wage goods constraint cannot be held responsible either for the slow-down in the growth of heavy industries after the mid-sixties or for the slow growth of light industries throughout. The slow-down in the growth of commercial crops output was not accompanied by a slow-down in the growth of agro-based industries after the mid-sixties, though the evidence is not conclusive on this score. The demand side stimulus to industrial growth from agriculture was low due to the small growth in per capita agricultural income but the growth of industry fell short even of this potential.

### EFFECT OF INCOME DISTRIBUTION

The income distribution hypothesis has two variants. One put forth by Mitra and Nayyar argues that the low level of the demand for mass consumption goods restricts the demand for them and, therefore, the demand for intermediate and capital goods. Pushed to the extreme, this would imply that sustainable industrial growth is possible only in an egalitarian society. Also, this variant would not explain the low rate of growth even in the 'luxury' goods sector, unless it takes into account the policy factor. The second variant, identified with Bagchi and Chakravarty, stresses either too little saving or too much saving as the causal factor of poor industrial growth. Events have disproved the former: the growth rate of industry in the 50s and 60s was higher when the national saving rate was closer to 10 per cent, than in the late 70s and 80s when the saving rate has been above 20 per cent. The latter argument, based upon worsening income distribution, is not supported by the trends as brought out in NCAER and NSS surveys analysed by Montek Ahluwalia, Dutta and Vaidyanathan.

Available information, the author asserts, on the distribution of incomes suggests no evidence of increasing inequalities over time. Data also do not support the claim that rural poverty has increased or, that rural net savings ratios have gone up steeply as a result of the green revolution and official food procurement. The pattern of growth of consumer goods industries does not provide an empirical basis either: the growth of output of consumer non-durables was unchanged at 5.7 per cent per annum in the period before as well as after the mid-sixties, while that of consumer durables slowed down only slightly but insignificantly such that the growth was about 12 per cent per annum. If worsening distribution of incomes were a factor influencing growth adversely after the mid-sixties, the effect would have been seen on the growth of consumer goods industries. In fact, the deceleration in growth was concentrated in heavy industries while consumer goods grew at more or less the same rate, i e, 4.5 per cent per annum before and after the mid-sixties.[3]

### INFRA-STRUCTURE INVESTMENT

The importance of public investment cannot be gauged by the mere fact that it constitutes 40 to 50 per cent of total investment. The direction of public investment into critical areas such as infrastructure and agriculture, which together account for about 45 per cent of public investment, is of even greater significance (a fact which perceptive businessmen realised sharply after the declared plan holiday). The effect of an expansion in public investment on industrial growth can be traced through generation of supplies of critical inputs and infrastructure facilities for the overall industrial sector and creation of demands for heavy industries. An analysis of the trends in public investment reveals a significant slow-down in growth after the mid-sixties which is true, to a smaller extent, of total investment too, and it was concentrated in railways and power. The deceleration was very marked in public real fixed capital formation, from 10 per cent per annum during 1956-57 and 1966-67 to 5.8 per cent per annum during 1967-68 and 1979-80. Private real fixed capital formation growth also declined between the two periods from 8.2 per cent per annum to 2.8 per cent per annum. Infrastructure investment which had grown at an annual rate of almost 17 per cent in the first half of the sixties experienced a marked deceleration to a bare two per cent per annum in the following decade (though, in a strange inversion of traditional plan policies, public investment in trade, hotels and restaurants went up rather sharply).

The phenomenon of under-investment in the railways was combined with a gross neglect of the maintenance of the existing railway capital stock. The slow-down in growth of real investment in electricity was less marked, but hydel generation and transmission and distribution received much less than their optimal share. A commonly accepted role of thumb in power planning is that investment in transmission and distribution should be about 66 to 100 per cent of that in generation. In fact, this ratio increased from a low of 38 per cent during the Third Plan to 51 per cent during the Fourth Plan but declined again to 42 per cent in the Fifth Plan. Planning and implementation of transmission and distribution projects is a major area of weakness with the state electricity boards. The under-investment in the infrastructure sectors was associated with evidence of growing inefficiency in these sectors. These inefficiencies covered the entire spectrum, from project formulation to project implementation and finally to operational stages. The railway transport coefficients of major bulk commodities have been declining steeply. The regions most affected by power shortages were the eastern and north-eastern, thereby reinforcing the constraints of coalfields and electrified railways.

Since the overall rates of capital formation and saving in the economy have risen to respectable levels, the failure to generate a comparably high rate of growth of income has to be blamed on poor management. Lack of optimal balance between the capacities created was also to blame, but here the author's analysis is weak and patchy, for understandable technical reasons.

### IMPORT SUBSTITUTION

The slow-down in import substitution since the mid-sixties comes out very clearly in the two digit industry classification. In manufacturing the slow-down covered industries accounting for almost 80 per cent of the total value added, the most significant exception being electrical and non-electrical machinery. In fact, some fast growing developing economies have also gone through an initial phase of import substitution and subsequent slow-down without a deterioration in industrial growth performance but accompanied by rapid growth of exports. Perhaps, the deeper the process of import substitution is carried, the more the economy finds itself with industries in which it is less and less likely to have comparative advantage! Export pessimism, unfortunately, has been a crucial ingredient in the Indian development strategy. It is worth noting from Ahluwalia's analysis that heavy industry has suffered mainly from slow-down in public investment and mismanagement, not from decline in import substitution.

### NEGATIVE PRODUCTIVITY GROWTH

Perhaps the most useful original contribution in Ahluwalia's work is the trends in total factor productivity growth. While I am not competent to assess the methodology adopted, her conclusions are startling enough to retain their validity even if the methodological biases were to be corrected with more sophisticated know-how. In any event, they are in line with the impressionistic observation of anybody connected with industry. Deriving total factor productivity growth as the difference between the growth of value added and the weighted sum of the growth of labour and capital, she finds that, for the manufacturing sector as a whole, *the estimate of total factor productivity growth yielded by the different measures ranged from minus 0.2 per cent per annum to minus 1.3 per cent per annum between 1959-60 and 1979-80.* In industries accounting for 50 per cent of the value added in manufacturing, the decline in factor productivity was more than one per cent per annum. The efficiency in factor use in the intermediate goods industries declined at the rate of about 1.5 per cent per annum over the twenty year period; this decline must have had a magnified effect on other industries through the inter-industry linkages.

It has been known for some time that value added has been declining as a proportion of value of output, thanks to rising materials costs (please remember that most of Indian industry is materials-intensive rather than labour-intensive); Ahluwalia has demonstrated that this lay view is consistent with tested objective reality.

While there is no clear-cut evidence of deterioration since the mid-sixties (indeed machinery industries recorded some improvement), analysis of the trends in capital-output ratios, which is the conventional measure of efficiency of capital use, brings out that the increase in the ratio was *not* due to the greater significance of more capital intensive industries. Between 1959-60 and 1965-66, such industries accounted for only 21 per cent of the increase in capital-output ratios, and between 1966-67 and 1979-80 the contribution of their changing share was actually negative. The growth in labour productivity in manufacturing between 1959-60 and 1979-80 of 2.5 per cent per annum was more than wholly accounted for by the process of capital deepening of 3.1 per cent per annum. The author concludes that industrial stagnation in India reflects the cumulative impact of the growing inefficiencies in factor use over time.

### GANG OF FOUR

Summing up, the author identifies four factors which contributed to industrial stagnation. These were: (a) slow growth of agricultural incomes and their effect in limiting the demand for industrial goods, (b) the slow-down in public investment after the mid-sixties with its particular impact on infrastructural investment, (c) poor management of the infrastructure sectors, and (d) the industrial policy framework, including both domestic industrial policies and trade policies, and their effect in creating a high cost industrial structure.

She opines that boosting public investment in specific sectors may have secured higher utilisation of capacities in the short run, but this may not have been the best use of resources from a long run point of view. Apart from reservations with respect to the desirability of expanding public investment for demand considerations, there is an additional question about its feasibility. First, there is the resources constraint. Second, it has to be recognised that the net impact of an expansion in public investment on demand would depend upon the extent of the crowding out of private investment (through competing for the limited funds for investment available to the economy). In passing, she also feels that the attitude towards deficit financing has been conservative.

# Thorough and comprehensive review of the Banking Industry is the need of the hour.

**THE UNITED WESTERN BANK LIMITED**

## Speech of the Chairman Shri. A.G. Pandit at the 48th Annual General Meeting of the Shareholders held on 28th June 1985.

**LADIES & GENTLEMEN,**

It is a great pleasure to welcome you to the 48th Annual General Meeting of our Bank. The Annual Report and Financial Statements as at the end of the year 1984 have already been circulated and with your permission I take them as read.

The year 1984 witnessed the brutal assassination of our Prime Minister Mrs. Indira Gandhi. She struggled for the unity and integrity of our Country. She led us for almost two decades in which our Nation made notable progress on various fronts. We pay tribute to her for giving the banking industry a totally new orientation and a sense of direction that helped it to switch over from the stagnant traditional banking to dynamic developmental banking aimed at achieving integrated and broad-based economic growth for the Country After her death, Citizens of this Country once again gave evidence of their deep rooted faith in democracy by bringing about smooth change over of the New Government under the inspiring leadership of our young and dynamic Prime Minister Shri. Rajiv Gandhi in the last general election.

We also mourn the death of Shri Yashwantravji Chawan, who was not only a National leader, Freedom fighter but a guide & friend of this Bank. His love towards this institution was basically natural not because it was from his native district but because he was a genuine witness to its growth.

During the year 1984, our bank continued to march towards progress in its business over that of the previous year. The bank added Rs. 23.63 crores in deposits and attained a land mark in the annals of its history by crossing a deposit figure of Rs. 200 crores. Thus, its total deposits amounted to Rs. 203 69 crores as at the end of 31st December 1984

**Profitability of the Banking Industry:**

The banking industry was brought under social control in the year 1968 and since then it is being used by the Government as one of the important instruments of social change. Accordingly, banks have been discharging this great responsibility with remarkable success by channelising their resources, monetary as also human, in desired and hitherto neglected economic sectors and by extending their operations to remote and normally non-lucrative rural areas. The above experiment meant financing every conceivable economically viable activity which ranged from, "shipping to shoe shining" and from international trade to dry farming in the rural areas.

The range is stupendous and one doubts if such an experiment has ever been successfully undertaken by any other country in the world. This, however, has subjected the banking industry to tremendous strain on its profitability.

The Reserve Bank of India and also the Government of India have shown due consideration to the problems faced by the banks, and to meet the situation, have, from time to time, released various concessions such as interest rate subsidies, refinance for certain priority sector advances at concessional rates etc. Although these concessions have, to some extent, alliviated the strains created by the industry's problems, the element of adhocism could not completely be eliminated while granting them. I consider, therefore, that in the light of the experience the banking industry has gained in the past 17-18 years i.e. after social control was introduced, now is the time when the Government should undertake a thorough and comprehensive review of the banking industry in all its aspects, such as, the wide range of activities at present financed by banks permit them to which, incidentally, do not encourage specialisation so necessary for bringing about efficiency in their operations and the rates of interest on advances including priority sector advances The proposed review should also cover the existing packages for refinance for priority sectors not excluding one concerning export finance, where refinance under the present scheme is made available only on the incremental levels, thus, while a large portion of such advances do not qualify for refinance, these continue to earn interest at uneconomically low rates

The findings of such a study should enable the Government and the Reserve Bank of India to devise a long term banking policy that will ensure healthy and continued growth of the banking industry while enforcing its monetary policy, the guiding principle for deciding which, it is conceded, has to be the country's monetary needs and not the profitability of the banking industry

Now, I shall turn to the performance of our bank for the year 1984.

**SHARE CAPITAL :**

There is a change in the Authorised Capital of the bank in the year under report. The Authorised Capital of the bank has been increased from Rs. 50,00,000/- to Rs. 75,00,000/- during the year. The bank issued 20,000 equity shares of Rs. 50/- each which were fully subscribed and paid-up. Thus, the bank's issued, subscribed, called up and paid up capital stands increased at Rs. 50 lacs at the end of the year

**RESERVES :**

The Board of Directors have recommended to appropriate an amount of Rs. 24 lacs from the profit of the year to the Statutory Reserve taking it upto Rs. 109.50 lacs. Our aggregate reserves now stand at Rs. 112.01 lacs.

**DEPOSITS :**

Our bank has shown a satisfactory performance in deposit mobilisation. The total deposits of the bank have gone up to Rs. 203 69 crores at the year end from Rs. 180 06 crores of the last year. The average growth rate, works out to 15.82% which is only marginally lower than 16.19% of the previous year.

**ADVANCES :**

The total outstanding advances at the year end reached a level of Rs. 118.25 crores as against Rs. 105 72 crores in the last year.

The bank has continued its efforts to give financial assistance to priority sectors such as Small Scale Industries, Agriculture, Small Business, Professionals and Self-employed Persons Bank's priority sector advances have increased to Rs. 39.40 crores as against Rs. 38 99 crores for the year 1983 Bank is actively participating in assisting the weaker sections of the society in accordance with the National Policy with special effort to step up IRDP advances and advances under New 20-Point Programme Bank has extended credit of Rs 84 87 lacs and Rs 2 47 crores respectively under IRDP advance and New 20-Point Programme Bank's advances to Agriculture, Other Priority Sectors and DRI Scheme as at the end of the year were Rs. 8 00 crores, Rs 10 10 crores and Rs. 0.25 crores respectively. As regards advances under SEEUY Scheme, I am happy to announce that our bank has crossed the physical target of number of beneficiaries of 635 in 1984 and has sanctioned 684 cases during the financial year 1983-84. Total amount sanctioned under this scheme comes to Rs. 1.1 crores and our bank is, thus, actively participating in the lending programmes announced by the Government of India.

**FOREIGN EXCHANGE BUSINESS :**

The performance of our bank in foreign exchange business is also satisfactory. The turn over of our merchant sale and purchase transactions amounted to Rs. 52.47 crores during the year as compared to Rs. 25.94 crores in the previous year. Financial assistance for exports at the end of the year stood at Rs. 10.39 crores as against Rs. 6.27 crores at the end of 1983 Taking into consideration the lucrative income on this type of business, while arrangements for handling foreign exchange business at our Hyderabad and Panjim branches have almost been completed, we intend to open a few more foreign exchange centres shortly for which we are already holding necessary licences from the Reserve Bank of India

**PROFIT & DIVIDEND :**

The bank has earned a net profit of Rs. 29.95 lacs showing a rise of Rs 6.85 lacs over that of the last year It gives me a pleasure to state that the Board of Directors have recommended to maintain the last year's dividend of 14% to the shareholders.

**MECHANISATION IN BANK :**

At the industry level, a decision to introduce mechanisation/computerisation in certain identified areas has been taken to enable them to extend better customer service and to effect better operational efficiency. Recently the Reserve Bank of India has formed a high level Committee comprising the representatives of Central Government, Reserve Bank of India, State Bank of India and its subsidiaries, all Nationalised Banks and Private Sector Banks to ensure smooth introduction of computerisation in the banks and as well as for standardising related procedures. Our bank represents the private sector banks on the said Committee. We shall, therefore, have to fall in the line with other banks in this area.

**ORGANISATIONAL STRUCTURE :**

The task of re-organisation of administrative set up at Head Office and Divisional Offices for improving working efficiency was entrusted to the National Institute of Bank Management and they have submitted their report. The implementation of the New Organisational Structure in the light of the recommendations of the National Institute of Bank Management has begun and it will be completed in stages in 1985

The relations with staff remained cordial and satisfactory during the year

Thank You,

**A.G. Pandit**
**Chairman**

**This does not purport to be the proceedings of the Annual General Meeting.**

## DEFICIT FINANCING

While reviewing the gamut of trends and policies analysed by Isher Ahluwalia, let me start with the last remark which is an aside but which cannot be left as such. The average annual growth in net national product at factor cost at 1970-71 prices between 1970-71 and 1983-84 was 3.7 per cent. In comparison, broad money ($M^3$) increased 17.2 per cent and the wholesale price index 9.8 per cent on an average annual basis between March 1971 and March 1984. The Reserve Bank's net credit to government was the principal source of reserve money, amounting to 83 per cent in 1970-71, 85 per cent in 1980-81, rising fast thereafter to 92 per cent in 1983-84. As a proportion of gross domestic product at current market prices, the outstanding amount of Central government securities including Treasury Bills was about 17 per cent between 1970-71 and 1976-77, but rose steadily thereafter to reach 24 per cent in 1983-84. More than two-thirds of these securities are held by the banking system, and almost the entire balance by institutional investors.

With all this in focus, particularly since 1980, it is hardly correct to state that the government has been too conservative in the matter of deficit financing. While some order of single-digit annual price increase is inevitable and perhaps also desirable, it is contrary to good sense to advocate, even as an aside, a higher order of deficit financing in order to promote industrial growth, which can result only from a clearer formulation and articulation of long-term objectives, and policies and mechanisms consistent with these, as well as with emerging short-term situations.

## OBJECTIVES, PRIORITIES, CONTROLS

In the national perspective, a multiplicity of objectives such as industrial growth with its inter-linkages, generation of employment, promotion of balanced regional and ethnic development, saving and earning of foreign exchange, to mention the principal ones, is unavoidable. A trade-off between these objectives is necessary from time to time depending upon the weightage of each in a given situation. No single objective, and no single sector or sub-sector, can have the "highest priority" indefinitely for all time: it is an axiom of any organised effort at planning that priorities have to be related as consistent quantities procured from subsystems at various levels of performance, that the basic function of control is to set objectives and give sanction for sacrifices or posteriorities, resolve inter-sectoral or inter-departmental conflicts or frictions, and evaluate performance for setting future sights, leaving scope for adequate initiative on the part of each performance level. Our control systems are of World War II vintage; they hardly worked even then, and, to the extent that they worked, they disregarded costs; they were even at their best not intended to be stretched till infinity as they have almost been.

As a young student in the late forties and early fifties, the heady years after war and Independence, I was brought up to have faith in development on a war footing: if regulations, pleasant or unpleasant, could be advocated and implemented for war, and sacrifices consequently endured for objectives considered dear and valuable, then, why not the same for development also? Rather than endure the cycles of boom and slump of unregulated capitalism, and the prolonged blight of under-development, why not substitute the atomistic or monopoloid market with wise far-sighted men dedicated only to the common good, and replace profit with social benefit? Arthur Lewis and Hicks, Hicks and Rostas gave ample warning against this approach but, the warning was ignored in India in what were by Indian standards boom conditions in industry during the fifties and early sixties.

Briefly, Arthur Lewis had cautioned against controls, especially price and profit controls, on essential activities, which would discourage further investment in them, leaving non-essential activities free to make large profits. The lesson we drew from this warning was to seek to control almost everything, including both the strong and the weak, for nearly all time. Hicks, Hicks and Rostas were quite emphatic that unlike war, development had multifold objectives with built-in conflicts, that development could not ignore costs of operation and of asset replacement, that human beings valued their income and relative status more in peacetime than their blood in war. What we lifted from them (despite their categorical warnings) was the concept of tax on excess profits or control on prices to reduce profits in those industries which were the prime beneficiaries of development like steel and cement, on the ground that such profits were of a windfall nature and should be sucked away through one form or other of betterment levy.

Underlying such policy views was the Hotelling Theorem presented in *The Economic Journal* (1926) and the subsequent debate on welfare maximisation under both competitive and socialist systems, through equalising prices with marginal costs, and recovering fixed or overhead costs from direct taxes which could not be shifted by definition (an article of faith established by the UK Royal Commission on Taxation in the early 1920s).

## NEW LOGICAL FRAMEWORK

After the 1950s, nearly all professional economists shifted away from these basic tenets (and cheap money) towards the other extreme of generating surpluses from essential industries and scarce capital or commodities but, a whole generation of policy makers had, meanwhile, imbibed The Original Truth and would not be shaken out of Faith till events overtook them. No amount of facts can, it is known, controvert a philosophy. Even false or failed gods are not abandoned till new ones are put in their place. It has been generally recognised for some time—on both sides of the divide between socialism and capitalism—that central planning (as well as business corporate planning) and the market mechanism need to be consciously and systematically integrated for the twin objectives of growth and welfare. We are still quite far, however, from a new logical framework that inspires faith and commands acceptance through performance. Pragma is obviously inadequate, not only because it comes under immediate attack from the high priests of accepted deities, but mainly because it leaves one without any sheet anchor of reference.

It is beyond my competence to draw up a charter for a new faith. I can merely draw attention to a few salients. First, nobody in his senses wants deletion of all central direction or planning. Even the basic functions of the State, namely, defence, law and order, and justice, require a significant centrally-determined re-allocation of resources towards central objectives. New basic needs like infrastructure, money and banking, education, health, town planning and environmental conservation need some degree of intervention or regulation since they cannot be left entirely to market forces. Every large organisation requires some variety or degree of corporate planning with defined objectives and perceived constraints, together with an assessment of the benefits and costs of alternative strategies. Planning is not a monopoly of government, nor is government or large business independent of market forces. A complex modern inter-dependent economy is an inter-weave of group direction and individual initiative, with the bureaucracy and market intermediaries as essential middlemen. A delicate balance between the *babu* and the *bania* holds the key to macro-economic efficiency.

Second, public ownership of the principal means of production (other than agricultural land) needs some re-definition not only to keep away from the abuses of State Capitalism (in particular, the strong temptation to treat public property as private or factional domain) but also to incorporate the recognition of plural institutional public entities and decentralised local bodies in the conceptual framework of public ownership. Participants in the current debate on de-regulation or liberalisation have spent their energies on the relatively peripheral matters concerning private trade and industry, ignoring the central reality of pervasive regulation (often in the name of co-ordination or parliamentary accountability) as *the* prime immover in government and the public sector. Conceptually as well as empirically, de-regulation or liberalisation can make effective headway only if it starts with the commanding heights where operating management is choked by the political and administrative proprietors of the day.

Third, there have to be accepted social criteria for productivity and efficiency in the utilisation of resources, especially in the public sector itself (governmental as well as commercial), since it is a much larger part of the economy than ever before and its strategic role is crucial for both growth and welfare. When the public sector accounts for one-tenth of national income, a misdelivery system can pass with tolerant amusement. At one-third of national income, together with pervasive regulation, the misdelivery may not be fatal but it has to be taken seriously as a problem in conceptual systems, not just in 'implementation' or 'co-ordination'.

### PLAN KNOW-HOW

At the risk of uncivilised disturbance of quiet academe, may I ask for some upgradation of plan technology? Way back in the 1950s, the inter-sectoral input-output matrix was a near-revolution (with distinguished French ancestry). Since then youthful energies have been devoted to raising the number of sectors to more than a hundred but, within the limits of my moderate literacy, I am not aware of any significant alteration in the rigorous assumptions of the matrix. Must we live with a framework which assumes *inter alia*, subject to correction by the more literate, that over a given time period:

(i) there is no change of relative prices of inputs/outputs;
(ii) there is no change in technology or capital-output ratios;
(iii) inventory (or working capital) requirements can be ignored; and implicitly
(iv) financial planning is irrelevant?

While explaining macro-plan concepts to a broadening spectrum of practitioners, my discomfort with the above Plan equilibrium analysis exceeds my discomfort in earlier days with competitive or monopoly equilibrium. Planning is a dynamic policy function. Pray, wherewith shall it be salted if productivity, inventory and money are put away?

Furthermore, some of the advances in corporate planning techniques over the last three decades can be usefully grafted on to central planning techniques. That the latter have to operate in a plural, federal society should never be forgotten (though often it is), but the former has a sharper focus on the time pattern of benefits and costs and consequently on working capital, which needs to be integrated into central planning, now more dependent upon generation and ploughback of public sector surpluses.

Growth models that came in vogue from the 1930s onwards classified and established what industrial businessmen and economic historians had known for long, namely, that public sector investment is or can be autonomous of pre-existing market demand or savings and that, the function of planning is to impart it with maximum leverage, that is to direct the investment in channels which have the maximum linkage co-efficients. Some refinements need to be incorporated in the light of experience.

### SOME REFINEMENTS

(i) This autonomous force of public sector investment can attack the points of linkage in a sustained manner only to the extent that it actually generates and ploughs back substantially larger surpluses. The autonomy, in other words, is finite and limited.
(ii) Procedural exigencies lead to bunching of most Plan investment orders in the middle of each Plan period (remember what Schumpeter said of bunching of new men, new ideas, new products, new methods of production, etc? The New Commanders have not yet evened out the high and low tide). Order books of suppliers (both public and private) are thin at the beginning and end of each Plan period. The long-term success of any business enterprise dependent upon orders arising out of public investment hinges upon getting over-committed in mid-Plan, phasing out the deliveries over a period longer than contracted, and keeping down mobilisation of equipment and labour to below the required peak level in order to keep down overheads during the lean years. This unwritten business rule might, to the uninitiated, smack of monopolistic restriction of output. Actually, it is the key to survival in a skewed monopsonist market. In any event, it is a high cost process for the community as a whole because it implies either reinforced delays in completion of projects or frequent idle labour and equipment or mismatched inventories or, all of them. To this extent, central planning does not overcome the deficiencies of the market mechanism. The fast-or-feast phenomenon can be tackled only upstream by long-term planning of high linkage standardised items, advance orders by negotiation instead of tenders, stringent penalties for delayed deliveries and insistence upon effective, total control of project implementation, rather than meticulous application of obsolete compartmental rules. To my knowledge, the rule book of government purchases has not been revised to take cognisance of large inter-linked project orders. That the task is feasible has been shown by National Thermal Power Corporation and, earlier, tragically by Kudremukh Ore Project.
(iii) The dividing line between Plan and non-Plan outlay has become as meaningless or socially destructive as the historic dichotomy between high-caste and low-caste. The end of each Plan converts the maintenance of so-called completed projects into non-Plan outlay which (along with the growth of administrative and security expenditure) is now of much greater significance.

New from SAGE Publishers of the Professional Social Sciences

**Evert Vedung**

Political Reasoning

"The book accomplishes its actual task admirably. Vedung is clear, organised, and full of useful observations." (*Ethics*)

The author discusses in length the concepts of political language and reasoning. He explores alternative approaches to research on political messages. Vedung concludes by examining a variety of methods for assessing political values. Researchers, scholars and students will treasure this comprehensive text and sourcebook as a useful tool for political science, political theory, international relations, and political communications scholarship.

SAGE PUBLICATIONS INDIA PRIVATE LIMITED
Post box 4215 New Delhi 110048

Since plan (or capital) outlay is more glamorous (and more attractive to fly-by-night public entrepreneurs), little attention is devoted to getting returns from older investments through adequate physical maintenance and provision of the equivalent of working capital, while more attention is focused on getting sanctions for a large number of new Plan projects, even at the cost of grossly inadequate funding of each one of them. Such compounded wastage piled high on top of inflation erodes the resource base for public investment. The damage from ending this false and suicidal distinction from the Eighth Plan onwards will be restricted to the continuity of the statistical series of Plan outlay figures.

(iv) For at least a decade, if not two, after independence, a quiet but conscious bias in the locational pattern of public investment (including defence outlay) and postage stamp rates for essential commodities was maintained in favour of Punjab and the South, partly for security reasons, partly for reasons of ethnic integration. Neither of these two reasons is alien to or inconsistent with central planning. It has now to be clearly recognised that the regions east of Varanasi require a new positive bias, not in policy statements or increases in per capita public outlay, but in performance on the ground. Apart from security and ethnic reasons, there is a large concentration of poverty in these regions. Infrastructure is both deficient and sadly inefficient. Productivity is a dirty word. Industrial relations are at best patriarchal, at worst, chaotic. New technology has barely touched agriculture. River floods are unavoidable in the foreseeable future. West Bengal excepted, caste/tribal conflicts are endemic and land tenures are uncertain. State governments or central administrations in Union territories are even less of working entities than in the rest of the country. Damodar Valley Corporation and Hirakud in the early Nehru era, and some improvement of communications in the northeast after 1962, marked the beginning—and end—of conscious effort in these regions. The whole area is riverine and highly fertile. One has to get away from high cost compartmental attention through security steps, sectoral programmes, central projects, centrally sponsored schemes, state plans, flood control, working of large public and private industrial units, etc, on to a comprehensive but quite cost-effective view of eastern and north eastern security and development problems as a whole, and then see how each programme contributes towards solution of these problems.

My purpose in drawing attention to these salients is not to fly away from the immediate concerns of what is called industrial policy but to try to fit industrial policy into a wider perspective of emerging requirements. It is a fallcy to believe that de-regulation of private activity *alone* will fetch the millenium though I readily assert that the regulatory environment in which we have been brought up since the 1940s smacks more of negative pre-capitalist mercantilism than positive statecraft of any preferred brand. If, as is stated in some quarters, private investment has not spurted immediately in response to recent de-regulatory measures, the explanation lies apart from the time factor, in the usual trough between two mid-Plan peaks and the continued sluggishness of public investment in railways and power. Essentially, de-regulation allows management to function more effectively and efficiently and to promote investment selectively, it does not by itself directly boost the general level of investment. Central planning, corporate planning, market mechanism and individual initiative, all have a positive integral role to play, generally in cohort, sometimes in conflict with each other for, that is the very essence of a plural society.

## SPECIFIC BUGBEARS

Having reiterated the primacy of central direction for major policy goals and of efficient public investment, especially in infrastructure and heavy industries, let me deal with a few specific bugbears. First, industrial licensing and MRTP. My work on these areas in the 1960s has spawned a lot of misconceptions, strengthened by lack of direct reference to what was written originally. (The works have been out of print for nearly two decades. I have recently arranged a reprint). Even then I had pointed out that licensing was a very limited tool of industrial policy and increasingly so, as direct public investment and a variety of other policy measures (especially the recommendation in favour of bank nationalisation and credit planning) were more effective means of achieving its aims, and that checks on concentration of economic power in private hands had to have positive aims of growth through general policy measures, rather than be effected through legal processes which were doomed to be futile.

To cut a long unhappy story short here, I would feel that, in principle, the Industrial Development and Regulation Act and Chapter 3 of the MRTP Act should go off the statute book, since other policy measures and mechanisms can serve their objectives and functions more effectively. Till that happens, the exemption limit for industrial licensing should be raised to Rs 100 crore, the same as for MRTP undertakings. The corollary of compulsory registration with DGTD should be abolished, and alternative arrangements should be made simultaneously for import licence eligibility and statistical reporting. DGTD itself is an anachronism now. Its technical skills, if any, are obsolete and compare unfavourably with the scientific and technological manpower available in both public and private units. After abolition, its staff could be deployed elsewhere in directly promotional agencies. I reiterate the recommendation in my report on licensing to delete the concern with capacity (which is nothing less than a racket from any standpoint) and new articles, both of which militate against better utilisation of resources and quick response to new plan and market demands. The concern of policy, in short, should be with the direction of investment, not regulation of production which is an operational matter.

Import licensing, whether of capital goods or materials, etc, should be de-linked from licensing or registration under the IDR Act. The credibility of new policy measures would be greatly enhanced if the policy statements and statutory notifications are issued simultaneously, so that a hiatus between the two (as has taken place now in respect of cotton textiles) is avoided.

In matters concerning FERA and ex-FERA companies, i e, policy towards multinationals, I would make only one limited point for the present. The official concern with percentages of share capital held by foreigners appears to be inspired more by shades of the caste system than any realistic appreciation of the mechanics of corporate control. The practical difference between holding, say, 11 per cent, 26 per cent, 39 per cent, 51 per cent or 74 per cent of share capital lies in the dispersion of the balance than in the intrinsic percentages. Much of the rest of the Foreign Exchange Regulation Act needs a fresh review from the policy viewpoint, so that transactions other than capital transfers can be effected without ubiquitous reference to the Reserve Bank.

## RELATIVE COST DISADVANTAGE

The 'real heat' now is in matters related to import control rather than industrial licensing or even FERA. The genuine areas of concern are not the traditional ones of foreign exchange constraint and import substitution but the more mature, meaningful and tricky issue of the relative competitiveness of domestic products. The issue is, fortunately, not so sweeping or pervasive as sometimes made out by Radical Defenders of the Faith whose nostrums apparently boil down to autarchy, underwritten with substantial concessional aid from the Pagans. Rather than enter the tournament between faith and logic, the approach should be to disaggregate the phenomenon and roughly quantify the magnitudes of volume and relative prices involved, together with the opportunity costs in major industries/markets. Nobody, for instance, is suggesting dismantling of the green revolution because international wheat prices are lower than domestic wheat prices. The bulk of consumption and investment will continue to be met from domestic production, whatever the stance on liberalisation might be!

In disputes at the margin, relating to conspicuous projects, one major question of alternative investment choice has escaped critical analysis: how worthwhile is it to step up our investment (with a predominant foreign exchange component) in petroleum in order to save foreign exchange on imports, along with all the associated 'elitist' development, as compared with stepping up investment in water for drinking and irrigation which involves no import substitution but subserves many other objectives? Petroleum can be imported at some price, but water cannot be. I am surprised that those who get quite worked up about *swadeshi vs bideshi* plants, for example, have totally ignored this larger issue.

Granted that no country has a totally free import regime, one needs a detailed exercise to determine: (i) the range of cost disadvantage of domestic products in excess of, say, 25 or 40 per cent, which level broadly indicates the "normal" level of import duty, and (ii) the more complicated question of technological lag in respect of designs and plant and machinery.

So far as (i) is concerned, the sad fact is that, due to low productivity across the board, and high prices of materials, and frequent resort to dumping in the world markets, the cost disadvantages are fairly ubiquitous and substantial. Yet, if these disadvantages are to be reduced over time, the interests concerned must be on advance notice to somehow narrow the productivity and price gap; exhortation will not be enough. Regarding (ii), assessments do tend, either way, to be less than wholly objective. My lay observation in the matter is that, in the past, there has been a tendency towards excessive protection and short-sighted attempts at substitution of *past* imports, rather than forward-looking substitution of *future* requirements, both reinforcing the technological lag. Some shake-up is absolutely necessary but its impact needs to be cushioned through stepping up of the relatively standardised orders for railway, power and telecommunications equipment on domestic producers, but here alleged resource constraints, actually poor and un-innovative management, is a bottleneck.

Resource constraints are familiar accompaniments of planned growth and have been known to bedevil plan-less low rates of growth also. It is the basic function of entrepreneurship, whether public or private, to overcome them—provided this function enjoys recognition and its operating arm, namely, management, is allowed adequate leeway, including the privilege of making a few mistakes on its own, which are generally cheaper than centralised mistakes with all the requisite prior approvals. The point is obvious in principle, but difficult of acceptance in practice, the moment one asks for flexibility and delegation down the line even within an over-all control system; it needs to be pushed, nevertheless.

It has taken the authorities a long time to perceive and accept the utility of adequate interest rates in real terms for mobilising financial resources. Even now, however, many of the popular saving media offer barely positive real rates. Those that do, like corporate deposits and debentures, have established the point that the mobilisable pool of resources is capable of manipulation for remunerative ends. This market borrowing, far more genuine than what has passed for it in the government budgets, would be a useful supplement to conventional 'plan' resources. It cannot make up a deficit of, say, Rs 10,000 crore in the Seventh Plan—if only because such debt has to be serviced at positive real rates of interest—but it should not be difficult to raise about Rs 500 to Rs 1,000 crore a year from this source.

Would such mobilisation tend to crowd out private investment, as Ahluwalia seems to fear? I doubt it for a number of reasons. First, unlike the successive pre-emptions of bank deposits for low-yielding approved securities and advances (as also for sick units and overdue advances), this mobilisation would be in successive rounds on market terms, not by administrative fiat. Second, larger availability of non-budget funds with public sector units should relieve the banks to some extent of their onerous financing of food, fertiliser, petroleum and steel, and thereby release funds for more flexible customers. Third, easier availability of medium term funds should enable public sector units to pay their bills to suppliers with shorter lags than they do now (provided their own performance improves). The danger on the other hand, is that this likely source could open up another window for concealed deficits and/or for the kind of improvident expenditure ideas that have received official blessing since the new bank proprietors also conferred upon themselves the 'rightful' authority to dispense bank funds. The market mechanism is a better and more effective safeguard against this danger than all the possible official checks and balances.

To conclude, may I express the hope that the younger generation of economists would apply their trained fresh minds to the problems of industrial planning and markets?

## Notes

1 If, as some have pointed out, there has been some improvement since the late seventies, it has to be more perceptible and sustained in order to have a leverage effect.

2 I have had serious reservations about the reliability of textile data ever since the 1950s: the formulae used for converting yarn into cloth have been consistently and increasingly wrong and misleading, and the growth of powerlooms and 'unregistered' imports and output have played havoc with the data. Anyone who travels around and sees for himself even in the remotest places (certain parts of Western Orissa, southern Bihar and eastern Madhya Pradesh excepted) bazars teeming with cloth and garment vendors and tailor shops of all price ranges, can establish the incredibility of official textile statistics and the level and pattern of cloth consumption derived therefrom. The data for sugar are known to suffer contamination from gur and jaggery.

3 It could be argued off the statistical record that the latter under-estimates the growth of consumer demand to the extent of the growing importance of unregistered imports and production, but a large part of these also percolate to the low income earners.

---

## Boppana Oils

BOPPANA OILS, a new company, is offering 4.90 lakh equity shares of Rs 10 each at par to raise a part of the finance required for its Rs 3.64 crore project of processing annually 9,000 tonnes of crude rice bran oil into cooking grade oil based on the technology developed by the reputed Japanese firm of Yoshino Seisakusho. The subscription list for the public issue will open on July 15. The issue is managed by the Merchant Banking Division of Canara Bank. The plant is located at village Punadipadu near Vijayawada and lies in an area popularly known as 'the rice bowl of Andhra Pradesh' where crude rice bran oil is in plentiful supply. The company has been promoted by B G Chowdry and associates with equity participation by APIDC. The promoters are technocrats with substantial experience in manufacturing, marketing and finance management. The implementation of the project is progressing successfully and the plant is likely to be commisssioned for commercial production by August. The project will help effect saving on the foreign exchange which is currently being spent on imports of edible oils. According to the Chairman, B G Chowdry, the company's production of refined oil at optimum capacity would be 4,500 tonnes per annum which constitutes only a small fraction of the overall gap between demand and supply for edible oils. The by-products, namely, free fatty acid, wax and gums have a ready local market. The country has been importing massive quantities of edible oils every year to bridge the gap between demand and supply. Despite record domestic availability of edible oils in the 1983-84 crop year, imports of edible oil aggregated over 16 lakh tonnes. The imports during 1984-85 (upto May 1985) have been more than 13 lakh tonnes and the value is higher than Rs 1,319 crore of 1983-84. The company's shares will be listed on the Bombay and Hyderabad stock exchanges to ensure easy liquidity of shares. The investors in the company's share will be eligible for 80 CC, 80 L, 80 M and wealth tax benefits.

# The Communalising of Punjab, 1980-1985

**Dipankar Gupta**

*Any attempt to comprehend the problem of contemporary Punjab should begin by first accepting the reality that a new minority consciousness has emerged. In which case neither the ethnicised history of a community, such as the Sikhs, nor the mere existence of a communal party like the Akali Dal, can explain, singly or jointly, the specificity of this new phenomenon.*

*It is for anthropology and sociology to plumb the depths of this problem but only after the practitioners of these disciplines too realise the uniqueness of the event. For so many years these disciplines had only primitive communal givens to contend with and write about. This gave rise to the belief that communal mobilisations only occurred between certain culturally pre-ordained groups. It was as if every dyad of proven communalism was a pair bound by a very special and inherent tie of antagonism, such as between the Hindus and Muslims or between scheduled castes and upper castes.*

*Punjab over the last six years should have changed all that. It has demonstrated that communalism does not require that its passions be always traceable to hoary traditions in order to raise dust and settle it down with blood. The communalising of Punjab over the last six years provides the only active historical base for the comprehension of the problem.*

THE tragedy of Punjab today is not the making of Punjab alone. The entire nation is party to it and is implicated by definition in the emergence of a new minority consciousness among the Sikhs. Yet such an awareness has never clearly surfaced because of the uncritical acceptance that communal practices are sponsored only by communal parties. Once this readily assimilable position is taken one has almost no qualms in ethnicising an entire population such as the Sikhs as being inherently prone to fundamentalist diktats. The possibility that Sikhs may have other identities too is relegated into the background. One has also, as a consequence, no qualms, no analytical bewilderment either, with the term 'Hindu backlash'. Unmindful of the communal swagger that this term validates it is freely used to explain the repeated and large-scale violations on the Sikh community by the non-Sikhs (primarily Hindus). The diacritica of this new majority consciousness should not have gone unnoticed.

## THE NEW MINORITY

Any attempt to comprehend the problem of contemporary Punjab should begin by first accepting the reality that a new minority consciousness has emerged. In which case neither the ethnicised history of a community, such as the Sikhs, nor the mere existence of a communal party like the Akali Dal, can explain, singly or jointly, the specificity of this new phenomenon. It is for anthropology and sociology to plumb the depths of this problem but only after the practitioners of these discipline too realise the uniqueness of the event. For so many years these disciplines had only primitive communal givens to contend with and write about. This gave rise to the belief that communal mobilisations only occurred between certain culturally preordained groups. It was as if every dyad of proven communalism was a pair bound by a very special and inherent tie of antagonism, such as between the Hindus and Muslims (cow worshippers *versus* cow eaters), or between scheduled castes and upper castes (pollution *versus* purity). Punjab over the last six years should have changed all that. It has demonstrated that communalism does not require that its passions be always traceable to hoary traditions in order to raise dust and settle it down with blood.

This is perhaps the unkindest cut of all to scholarship but there is no social tragedy however great from which anthropology and sociology do not happen to benefit. Undoubtedly in this situation too these disciplines are privileged for Punjab in the last six years approximated a gigantic laboratory leavening communal passions over a slow fire. The resultant Hindu-Sikh communal dyad does not seem any the poorer, or feeble, in spite of its late nativity. The nationwide massacre of Sikhs in November 1984 should leave little doubt on this score.

That fateful day Indira Gandhi cast a long morning shadow as she walked through the opening that connected residence to party office. Home and office, domestic menials and party liege men, all merged into one which only an acute exercise in parallax separated. When she fell her shadow fell too, only it crumpled faster to form a shady and irregular hem around her. Her legacy too adjusted to this stone cold certainty within a matter of hours and stayed true to the shady fringe that hugged her to the last. In a tutored attempt at reflexive mourning the dark margins came to life and roamed at large, displacing national shock with private griefs, and bloodshed with a blood bath. Through every slain victim the body of the 20th century *Purusasukta*—or the communal nation state—was reconstituted amidst howls and arhythmic chants of '*khoon ka badla khoon*'. It is at dark moments such as these that the term 'violation' draws deep into its etymological roots.

The massacre of the Sikhs in November 1984 was no thoughtless throw away curve. It completed the circle of communalism with such vigour that its involuted overflow darkened every space and publicly tainted the Centre.[1] The swiftness of the xenophobic stroke conveys the superficial impression that it was primarily reactive in character, thus justifying the wide circulation of the term 'Hindu backlash'. Even if one were to entertain the phrase 'Hindu backlash' for the time being with its reactive connotations then of necessity one must conclude that the score is now even: action-reaction, point-counterpoint. From the time of Operation Bluestar no opportunity was lost by the Centre to humiliate the Sikhs as a community,[2] and on each such occasion it has earned greater sympathy from the Hindus. The normal divisions between the Sikhs, such as between Jats, Mazhabis, urban Khatirs and Aroras, shaded off into a single identity because in the making of communalism subtlety is positively shunned.[3] As a matter of fact it is the Sikh identity that is reactive as many Sikhs till the November massacres had other political and social identities as well.[4] The fact that neither Hindu activism recognised it in deed, nor Hindu pacifism in words, signifies first the fact of Hindu communal consolidation *vis-a-vis* the Sikhs, and second, that Sikh communal identification is not a mirror image of Hindu communalism.

## THE LIBERAL AND LEFT PREDICAMENT

The communalising of Punjab over the last six years provides the only active historical base for the comprehension of the problem. The close infighting, feints, and counter-moves making for the dense minutae of these short years have also had the contrary effect of spreading confusion because the reportage on these events pivoted around the vivid prototype of the Sikh provocateur. Even among those resolute liberals and deliberate secularists who are still not willing to 'blame the victims' for the 'backlash' it is difficult to find a complete, unabashed, unquestioning, and irrevocable partisanship with the victims and potential victims. Unused also to viewing victims of communal violence as anything but poor, helpless and the traditionally persecuted, they feel that they are somehow being cheated by the sheer prosperity and the confidence of the Sikhs. So every time they raise a voice for this new minority it is hollowed by a dubiety they are unable to position. This adds to the concentricity of the Punjab problem as the victims categorically spurn the patronising hand up.

There is, however, one cultural factor which has also contributed to this unification of the Sikh sentiment. Sikh religion is a very young religion and still retains much of the vigour of youth. It is a participatory religion in which there is one principal text, the *Granth Sahab*, uniformly recognised five principal *takhts*, and hardly any significant doctrinal emendations or conflicting schools of interpretation. The gulf between the laity and the hierarchy is nowhere as wide as in most other religions. The congregation do not sit back in awe and incomprehension but intone silently but knowledgeably with the *granthis* and *ragis*. But even this cultural factor does not stand alone. Sikhism has also been a vehicle in recent years for the assertion of the community's economic affluence. To be a Sikh was to be economically prosperous, independent, and enterprising:[5] and that is why many bleeding heart liberals are not sure whether they should bleed with the Sikhs or not.

For the left political formations too it would have been so convenient if only the Sikhs had been poor, helpless, and had sought patronage. The left could then have reflexively, and with a clear conscience, stood by the victims without being in two minds as they are today. Confused by the concentricity of the Punjab problem, confused too by the vigour and unanimity of the Sikh response they erroneously believe that the current intransigence in Punjab is an independent outcome of Akali politics. But this is certainly the lowest common denominator. If one works one's way through the positions that the left has taken over the years *a propos* of the Punjab, one finds that, on this issue at least, the entire gamut of left politics is quite rudderless. Several discordant voices pulling in different directions can be heard from the ranks of even the CPI(M). Many leftists, particularly in the CPI, even found words of praise for the Operation Bluestar which killed hundreds of innocent pilgrims in order to claim the lives of approximately fifty militants led by Bhindranwale.[6] Many among them also considered the Anandpur Sahab resolution as one potent with mischief which only reveals that they have either not read the resolution, or did not like the confident look of the Sikhs. The full story of the needless massacre at the Golden Temple has yet to be written, but in the following pages we will have occasion to return to a consideration of the Anandpur Sahab resolution only to show how its non-reading coupled with persuasive misinformation and disinformation by the Centre has created the chimeric image of the Sikh fanatic.

Still the left, particularly the Left Front government in West Bengal, gave evidence of what no-questions-asked-anti-communalism can be when they put a quick end to the anti-Sikh saturnalia in West Bengal. It must be remembered that anti-Sikh violence began in Calcutta even before the country knew that Indira Gandhi was dead. It was kicked off only after Rajiv Gandhi left West Bengal on hearing of his mother's death on a privileged basis. The rest of India, true to the old adage, thought of massacres the day after. This is why the accomplishment of the West Bengal government on this score is unparalleled. It cannot be equated with the other non-Congress states because there were no riots in these states in the first place and also because the Congress partisans here were nowhere as powerful as they were in West Bengal. The success of the Congress in the 1984 parliamentary elections in West Bengal should demonstrate that.

### THE CRUCIAL YEARS: 1980-85

Even if we take the years 1980 to 1985 as the active historical base for comprehending the communalising of Punjab, one must of necessity also be willing to move vertically and horizontally, and co-mingle various levels of India's polity and society to provide perspective to the last six years. One must, for instance, take into account the constraints under which the new political masters of India must function as micro chips of the old block; one must also be able to fathom why the promise of breathing on the open spaces of the 21st century must be accompanied by ethnic marginalisation. There was an opportunity earlier during the partition of learning some truths on issues such as these, but it was pushed aside in the euphoria of political independence and on the mistaken notion that there was something very special about Hindu-Muslim antagonism.

So history has obliged by repeating itself with the communalising of Punjab. It has again demonstrated the feasibility of making points with blunt instruments. But it would be a mistake to think that when history repeats itself then it is always as a farce the second time around. Be that as it may, the political centre stage today does not depict a single-act tragedy, or farce, but a vignette from a performance of epic proportions where climaxes heap upon climaxes leading exhaustingly to a wasted donouement. The donouement when it comes will reveal the waste, the tragedy, and possibly the farce too, but right now the unbridled need for climatic highs is still deliciously recalling the foreplay.

It helps to look back into the past to comprehend how the current passions were stoked, provided we use history and not let history use us. The past lends itself to the present with different degrees of valency: the recall subserving current obsessions. Many commentators of the Punjab situation have viewed the recently finished Sikh identity as an outcome of Sikh traditions and history with the present only offering another occasion.[7] As a matter of fact such unflexible uses of history are lit by spontaneous communal impulses so bright that the scholar-commentator often mistakes them for flashes of erudition. It is true that Sikh lore makes a great to-do about martyrdom, *peeri-meeri*, and so forth; and it is also true that the Akali Dal constantly returns to these evocative symbols. There are no doubts, least of all for Longowal, that the Akali Dal is a communal party, but there are grave doubts if the people of Punjab were politically always communal. If communalism were confined to the communal parties then the sluice gates of xenophobia could be jammed fairly effectively. It is only when it spills over that the circle of communalism darkens: the Centre and the periphery are equally tarred.

If one were to examine the career graph of the Akalis then it would become obvious that far from the graph depicting a steady curve riding high on lore, myths, history (mythstory), it actually features both peaks and troughs. If one wishes to go back to pre-Independence Akali politics the record would seem even shabbier. In 1946 when Master Tara Singh, prodded by the mythstory of the Sikhs, incomprehensibly lisped the demand for a separat Sikh state he found his constituency quickly leaving the room to have a hearty laugh outside.[8] He hurriedly withdrew this demand and was only able to re-establish himself much later during the partition by demonstrating his solidarity with India. If in those days this was accomplished by anti-Muslim bigotry, today it is accomplished by anti-Sikh xenophobia.

Incomprehensibly too, to the unreflecting scholar-commentator, some of the most outstanding Sikh Congress leaders of the past four decades had begun their political careers as Akali partisans. Their conversion to Congress did not make them apostates, nor were they declared *tankhaiya*. Swaran Singh and Pratap Singh Kairon are perhaps the best known among such men. Yet these notables did not cease being Sikhs, or even cease subscribing to the sectarian Sikh folklores and mythstory. If the Sikhs were really unable to distinguish between temporal and spiritual authority (as enunciated by the *peeri-meeri* duo) the Congress would never have won as resoundingly as it has in the past with Sikh votes, and neither would the Akali party have been in near disgrace in the 1980 elections. In the Sikh majority district of Ludhiana, for instance, the Congress won nine out of 12 seats in 1980.

## CHANDIGARH, WATER AND TERRITORY: TAKE OFF OF A SECULAR MOVEMENT

If there is a historic cut-off point for the current tensions communalising Punjab then it is 1980. That is the time around when the sluice gates of communal passions around Punjab were gradually being oiled and unjammed, and kept in readiness to be flung open. History stood by in attendance with its records and accomplishments, but in order of the most recent first. Not Guru Gobind Singh, nor the *gallughara* (literally, blood-bath) of Abdali, nor even the Akali *jathas* of the 1920s, got precedence. Like memory the past stretched slowly backwards from the present. Chandigarh, territorial disputes, and the sharing of river waters were the main issues then. Ironically the martyrdom of Guru Tegh Bahadur seems all important now. Five years of Congress rule inclusive of Operation Bluestar and the Sikh massacres of 1984 mnemonically revived the past, pushed away the present, and filled in the concentricity of a new communalism.

The demand for Chandigarh as the capital of Punjab; the demand that the sharing of river water between Punjab, Haryana and Rajasthan be adjudicated by the Supreme Court; and the demand that territorial disputes between Punjab and its neighbours be decided by the territorial tribunal, were among the principal demands of the Anandpur Sahab resolution. This resolution was passed in 1978 when the Akalis and Punjab in their grip and also a finger in the sticky Janata pie in the Centre. Yet, the adoption of the Anandpur Sahab resolution did not signal mass communal excitement in 1978. All the Akali Dal did was to file a case in the Supreme Court on the issue of inter-state distribution of water. What is more, the Akalis showed no enthusiasm to implement any of the ethnic demands contained in the Anandpur Sahab resolution. Paradoxically the Congress(I) while refusing to take heed of the secular elements in the Akali resolution were quick to recognise and make concessions on ethnic issues. The most remarkable being the publicised willingness of the Congress(I) to constitute a separate Sikh code bill, thus amending Article 25 of the Constitution.[9]

## SOURCE CREDIBILITY OF AKALIS

Why did the Anandpur Sahab resolution come to mean so much in the years following 1980? After all the Akalis were defeated in Punjab a scarce two years after the resolution was formally adopted. The majority of elected legislators in Punjab after the 1980 elections were Sikhs, but not Akalis. But by 1982 Sikh opinion began to give the Akali Dal a source credibility which it perhaps lacked even in 1978. To comprehend this and to plumb the depths of the communalisation of Punjab the period since 1980 deserves closer scrutiny.

The increasing source credibility of the Akali Dal can be traced to two factors. First, the apparent transparent honesty of the Akali demands. Chandigarh, the Akali Dal demanded, should be given to Punjab as it was built as the capital of Punjab at a site where the majority language was Punjabi. The Akalis further urged that disputes over water and territory be handed over to superior adjudicating bodies and that the Dal would accept the decision of these bodies. In spite of the apparent honesty of the Akali demands, that alone would not have given it its source credibility. At this point we must take into account the second factor which enhanced the Dal's credibility, *viz*, the fact that the Congress never squarely faced the Akali demand. The Centre put off any consideration of the major issues by (a) calling the Anandpur Sahab resolution secessionist; (b) by withdrawing from the Supreme Court the case that the Akalis in 1978 had filed on water disputes; and (c) by linking Abohar and Fazilka with Chandigarh. The last meant that the only way Punjab could get Chandigarh would be if it gave Abohar and Fazilka to Haryana in return which are deep in Punjab. The transfer of these regions to Haryana would entail the construction of a corridor, not unlike Danzig. Instead the Akalis contended that all territorial disputes be handed to the appropriate commission/tribunal, and the matter be decided as in all territorial disputes, on the principles of contiguity and village (not block or district) level language enumeration.

Instead of responding to this position openly, the Congress(I) kept talking of Abohar, Fazilka, corridor, Chandigarh, all at once. To make matters worse, after their accession to power in Punjab the Congress(I) in 1980 withdrew from the Supreme Court the case on water distribution that was filed by the earlier Akali Dal government. When the Congress(I) withdrew the case the only reason it gave was that the Akalis were being unneighbourly and unpatriotic in moving the court.[10] If this were the case surely the Supreme Court would have given the same judgment and the well curved Akali sail would then have hung limp.

None of these three major demands made by the Akalis were ethnic or communal. They were straightforward regional and secular issues. West Bengal, Karnataka, or Andhra Pradesh could have come up with similar demands. But unlike these states, also known for the strength of their regional political formations, the party sponsoring these demands in Punjab was a communal party, the Akali Dal. Also unlike any of the issues actually raised by West Bengal, or by any other non-Congress(I) state, there was no ambiguity in any of these three issues raised by the Akalis since 1980. Not one of these could be reasonably controverted: at least the Congress(I) did not exert itself to do so. On the contrary it insisted on communalising these demands by raising the bogey of Sikh separatism. This immediately struck a responsive chord in Hindu hearts uneasy with forebodings of another partition.

I would further contend that the issues of water, territory, and Chandigarh were not equally important nor equally transparent in their honesty in the eyes of the Sikhs. Though each of them merited a 24-carat status, it was Chandigarh that was the real solitaire—shone to resplendence by the heaviest of Congress(I) handlings. For a long time, till actually Operation Bluestar, it was the unassailable Akali position on Chandigarh that helped the Dal to get its act together *vis-a-vis* the Centre. Though the Anandpur Sahab resolution also talked of reworking Centre-State relationships this aspect received no salience with the people. With time, however, as the Centre tossed about the issues of Chandigarh, water, and territory, instead of firmly grappling with them, the validity of redefining Centre-State relationships found vindication and objectification in the eyes of an ever growing number of Sikhs. Surely and rapidly the Akali Dal kept gaining in source credibility such that it was even emboldened to talk in terms of *Dharam Yudh* (religious war) on August 4, 1982 even though a large number of Sikhs still thought it to be quite irrelevant. Operation Bluestar and the November 1984 Sikh massacres completed the communal circle. *Dharam Yudh* suddenly became the most relevant issue.

## FROM SECULAR TO COMMUNAL: HEIGHTENING OF MINORITY CONSCIOUSNESS

If Operation Bluestar was designed to smash communal extremism, nothing could have been a greater failure. Secular and regional issues went into the shade and Sikh opinion consolidated as never before behind its religious ramparts. It is not as if Sikhs objected to the necessity of using the army to weed out criminal elements from the Golden Temple. In fact they would have favoured a police action in the Golden Temple as early as in 1982 when A S Athwal, the DIG of Police, was allegedly murdered by extremists. The groundswell of Sikh hostility to the army action of June 1984 grew as it did primarily because the brutality of Operation Bluestar resulted in the deaths of a large number of innocent pilgrims. Bluestar was followed by similar operations in other gurudwaras too, where again, as in Dukhniwaran Sahab in Patiala, a large number of devotees lost their lives. That Bhindranwale is near canonisation in the minds of many Sikhs today is because Bhindranwale's blood mingled with the blood of at least 400 pilgrims who died during Bluestar. Other factors such as the over use of force, mortar, HASH, and tanks which devastated large portions of the Temple fell in line and stoked this initial anger further. The scale of and the devastation wrought by Operation Bluestar even horrified some loyal Congress(I) members.[11] When the Bluestar showed no signs of a flagging momentum, and was followed by large-scale harassment of Sikhs, young and old, men and women, more recalcitrants slipped behind fundamentalist ramparts and ideologically barricaded themselves. The November 1984 massacres successfully nationalised this tendency among Sikhs. The enemy was no longer the Congress(I) government but the Hindu *sarkar*. The source credibility of the Akalis became unassailable and their communal prognostications took on a clairvoyant character.

This is what source credibility is all about. Once an individual or an organisation wins absolutic credibility on certain issues, thereafter, that individual or organisation is deemed in the public eye as a source of unimpeachable credibility such that its other pronoucements are subscribed to without scrutiny.[12] Exhortations towards martyrdom, towards traditional obeisance to the temporal authority of the *takhts*, towards the defence of Sikh religion and traditions; in short exhortations towards *Dharam Yudh*, began to possess a credible ring. It is not as if the past heavily burdened the present in 1980, but rather it is the manner in which the Centre reacted to the Akali demands, which were initially secular that mnemonically revived tradition as an ideological rationale for activism. If, however, we fail to take note of this and argue instead that Sikh religious consciousness was from the beginning the motivating factor then we would be making a superficial use of history, and in objective terms 'blaming the victims'. It needs reminding that every community is capable of creating a history full of glory, sacrifice and martyrdom. The Tamils of Sri Lanka next door are doing it right now. The Druze, the Palestinians, the Iranians, the Bengalis, the Maharashtrians, to name a few at random, have all demonstrated this capacity in recent times.

## HINDU COMMUNALISM AND SIKH COMMUNALISM

The gradual consolidation of Sikh opinion around the Akalis did not produce Hindu communalism. The two proceeded apace but were pointed in different directions. While the various Sikh factions tilted at the Centre, Hindu communalists organised against the Sikhs. The communalism of these two communities are still not mirror images of each other. Most incidents of communal violence on the streets, such as the recent ones in Hoshiarpur district, or the earlier ones in Patiala, Ambala and Panipat, as well as the Sikh massacres in November, have occurred where the Sikhs are in a minority. Rural Punjab where Sikhs are a majority is tense, thanks to the ruthless persecution of Sikh youth, but there has been no major communal incident in Punjab villages. It hardly needs repeating that from the early years of this century a significant section of the Hindu community in Punjab has rallied behind the Arya Samaj to deny Sikhism its separate identity. The gurudwaras too were under Hindu mahants who made every effort to efface them of any special significance to Sikhism. Hindu idols were installed in the gurudwaras to convey the impression that the Sikhs had no special claim to these shrines.[13] The Sikh resentment of this was obvious and understandable. This explains why it was necessary to take Hindu idols away from the gurudwaras in 1905 to appease the Sikhs. But the Sikhs even then were against that brand of Hindu communalism that was aimed against them and not against Hinduism as such. This is what allowed Gandhiji to talk to the leaders of the Akali movement of the 1920s like a school master.[14] Neither did Master Tara Singh receive mass approbation for his advocacy of an autonomous, sovereign Sikh state in the 1940s. This strain still characterises Sikh politics even though it has become much communalised. Already stress lines are developing and there is not much time before the mirror cracks from side to side and Sikh communalism becomes a mirror image of the Hindu one.

Time is indeed running out. Perceptions and counter-perception—not issues—seem to be fuelling passions increasingly. The perceptions among Hindus that the Sikhs are out for another partition is an outcome of a non-reading of the Anandpur Sahab resolution aided in no small measure by the Congress(I)'s deliberate policy to misrepresent the situation The radio and the television flood out by sheer cusecs of verbiage any possibility of a fair assessment of the Anandpur resolution. The view has gained ground that the resolution is every bit as cretinuous as Hindu communalism would wish: that in fact it is a mirror image of Hindu communalism. The fact that the Anandpur Sahab resolution of 1978 nowhere makes the claim that Punjab should be under the sway of *khalsa ka bol bala* (or Sikh fundamentalist diktat) will come as a surprise to many. The volume, consistency, and intensity of government misinformation and disinformation on Punjab tightly interwove with the popular perceptions of the Sikhs among the Hindus to give the Congress(I) an unprecedented number of seats in the Lok Sabha elections of 1984.

## UNDERCUTTING OF MODERATES

This Hindu communalism is no backlash. The raw material of popular Hindu perceptions was carefully worked upon by the Congress(I) such that in Punjab today one has two completely distinct views, one Sikh and one Hindu, on almost everything. In the years 1980 to 1984 the government portrayed the Anandpur Sahab resolution principally as a religiously inspired secessionist document, when in reality it was far from that. From 1980 to 1984 the government refused to talk to Akali leaders breaking off talks on one pretext or the other. On three instances in these years the Akalis were ready to negotiate but had to return to Punjab in humiliation. The talks were still-born because of the abortive tactics of the government. On one occasion on the eve of a slated round of talks P C Sethi suddenly announced that there would be no talks till normalcy was restored. This lofty pronouncement was made without even pausing to consider why talks should be held regarding the restoration of normalcy if normalcy prevailed anyway. The fact that there was no public condemnation of Sethi's position at the national level is symptomatic of the success with which the government had won the credibility of the non-Sikhs. On a second occasion Bhajan Lal's Haryana erupted with anti-Sikh riots in several districts on February 14, 1984 forcing the Akalis to return to Punjab. On a third occasion on February 18, 1984, on the eve of another round of talks, the police unnecessarily created an incident in front of the Golden Temple thus forcing the Akalis again to return to Punjab. But what is perhaps unknown to many is that on the eve of the inauguration of the Asiad in 1982 an agreement was actually arrived at between the Congress(I) and the Akalis, where even Harkishan Singh Surjeet of the CPI(M) was involved. While the Akali leaders, such as Prakash Singh Badal, and Congress(I) mediators were toasting this event and waiting for the official declaration from the cabinet, Indira Gandhi suddenly announced that the agreement was not acceptable to her. This not only dumbfounded the Akalis but several Congress(I) members too.

All this was cutting into the moderate and majority section of Sikh opinion. While Longowal and the Aklai Dal were gaining in source credibility they were not really prepared to carry out a fundamentalist drive. The moderates were thus shoe-horned into a dilemma by the force of their own latent potentialities. Each rebuff by the Centre gave respectability, *albiet* in small doses, to refactory Sikhs, and any concession to these elements by the Akali Dal weakened Longowal's public commitment to the integrity of India, to the Anandpur Sahab resolution and to communal amity. The Akali Dal is careful to play only a limited risk game of communalist politics. However, the Akalis at this juncture chose unwisely not to conduct an ideological war against Bhindranwale for a dubious kind of united frontism which publicly overlooked the enemy at the door step. Yet they could not help but constantly look back over their shoulders to protect their flanks against militant depredations. As a consequence the Akalis had only a blurred image of the Centre's moves and an incomplete grasp of the 'Bhindranwale effect'. After Operation Bluestar they were made to pay dearly for this. The meeting at Khatkar Kallan in March 1985, to commemorate Bhagat Singh's death anniversary is illustrative of this situation. Unaware of the public mood after long months in detention following Bluestar, Longowal began his speech by asking the gathering to consider issues "with a cool head". The hostility with which the *kesari* turbaned crowd created to this prefatory comment compelled Longowal to change gears instantly and adopt a shrill and belligerent attitude. As a consequence he had also to swallow his bile and refer to Bhindranwale as a *Sant* and a martyr. Neither did this position him advantageously *vis-a-vis* the Centre. All the latter had to do in this situation was to gloat to the rest of India with a: "I told you so".

If there was any pride (*izzat*) left among the Sikhs after the massacre of their numbers in the Operation Bluestar even that was being forced out into the streets. First, the Sikh library and museum in the Golden Temple complex was set on fire a full two days after Bluestar was officially concluded. Then again instead of allowing the SGPC to rebuild the Akal Takht and the bullet marked sanctum sanctorum and re-cover its shame, the government handed the task to an interloper from a renegade Sikh sect, the Buddha Dal, which further aroused the ire and resentment of the Sikh masses. This was followed by the arrest and torture of hundreds of Sikhs reminiscent of the Naxalbari operation a decade ago. The crucial difference with the anti-Naxalites operation however is that in this case it is enough to be a Sikh to be worthy of suspicion. Other identities do not matter.

The country's military and para military forces have come down heavily on the restless Sikh youth, both in the countryside and in urban areas. The youth who were already frustrated with the tapering-off of the green revolution were immediately incensed. Because of the pressure on land, and the decreasing returns on agriculture, they were now on the look-out for scarce jobs in urban areas, in the Middle East, and elsewhere. The number of schools and colleges that came up in Punjab after the state was redemarcated, especially after 1969, is evidence of the growing need among Sikh youth for formal education as a passport for other economic opportunities. They had already lost their privileged position in the army after the British left. All this makes for a very volatile and inflammable situation. It is often believed that resentment can only be furthered by absolute deprivation and to that extent the believers of such a position are at a loss to understand why the economically prosperous Punjab should demand more water and employment opportunities. But as a matter of fact economic deprivation is quite as often viewed relatively as well. The fact that the first thrust of the green revolution set off a standard of living and a scale of emulation which became difficult to sustain as the years went by should also be remembered. The increasing costs of agricultural inputs, the rush to buy mechanised agricultural implements which in many cases only increased the household's financial liability, queered the pitch a good deal and rubbed off some of the shine generated by the first few years of the green revolution.[15] The Sikh cultivators, of course, saw the problem as an economic one, so much so that the Bharatiya Kisan Union was able to hold a large rally even after the Bluestar operation in Punjab. Yet this has not been able to counteract the extant suspicion among the Sikhs that it is the Sikhs alone who are being singled out for persecution. The manner in which the Akali Dal slowly gained charisma and source credibility as mentioned earlier bred and fed this suspicion till it became an unshakable faith.

### Army Desertions: Communalising Process in a Microcosm

The 'desertions' of Sikh troops is another indicator of the level of alienation among the Sikhs today. Here too we find in a microcosm the national forces at work in the communalising of Punjab. Not once has it been mentioned that in Ramgarh, from where maximum desertions took place, as many as 20 out of 23 officers left their position in the Sikh Regimental Centre and sought refuge with their families elsewhere. It was only after the officers left their posts and left their troops leaderless that mass anxiety gripped the soldiers—some of whom were just raw recruits. On the following Sunday when it is the custom that every officer of the Sikh Regimental Centre, accompanied by his family, attend the regimental gurudwara along with the soldiers, there was not a single officer present.[16] Neither did the officers ever hold a *darbar* with the soldiers on this issue. Past practices should have made the holding of *darbar* an occasion to explain to the Sikh troops the compulsions of the Bluestar operation which would have helped to assuage their feelings. The first desertions that took place was the desertion of these officers. It is a fact too that Sikh soldiers everywhere were disgruntled and disaffected after the Bluestar operation, but wherever their officers stood by them and provided leadership 'desertions' did not take place. What fear, what propaganda took hold of the minds of the non-Sikh officers to desert their posts will never be known with certitude, but certainly the army command succumbed as much as did the nation at large to the persuasive typification of the blood thirsty, disloyal, extremist, and secessionist Sikh.

This continues to be evident during the court-martial proceedings too. While the soldiers under trial pleaded guilty to desertions, the prosecution is still not happy. The army prosecution wants to prove that these undertrials conspired and that the conspiracy was led by their JCOs and NCOs. The prosecution is unwilling to accept that the soldiers acted spontaneously out of grief and anger and that they were provoked by the desertion of their officers. To accept this would weaken the case against the soldiers and the accusing finger would point instead at the government and the army brass. Hence the long hours of torture and deprivation to compel the prisoners to commit perjury. So far they have held out by reliving in their minds the martyrdom of Guru Tegh Bahadur.

### Centre Strikes Back: Ethnicisation in Reverse

Since Independence India has constantly been embroiled in tensions between the Centre and the federating units. This has emboldened political scientists to put down in print that the cultural variations in India will soon bring down the fragile unity in the Centre which embodies the nation state. A closer inspection at the points of conflict between the Centre and the federating units however reveals that cultural factors *per se* have never put any tension on the political unit of this country. In fact, it would be wrong to believe that the current tensions between the Centre and several states is actually the final efflorescence of the earlier movements of cultural assertion. If anything there have been three distinct phases involving three distinct kinds of political problems over this entire period with reference to unity and diversity, or cultural primordialism and political cohesion.

The first phase was with the demand for unilingual states. This was followed by nativist or 'sons of the soil' movements. This in turn, after a gap of several years, was followed by regional movements which demanded a re-working of Centre-State relationships. It would be incorrect to assume that the last is the logical culmination of the first, or that any of these political phases ever questioned the Indian Union.

The most cultural of the above three kinds of political manifestations was the linguistic movement demanding unilingual states. This movement actually demonstrated the possibility of a nation state celebrating its differences and thus questioning both the inevitability or the inherent superiority of the western type of nation state.

The nativist movements too always turned to the Centre for help and looked upon the Centre as the prime adjudicating body, much as the linguistic movements had done before them. The Centre yet again played the role of the arbitrator but not before it had gained some advantages for itself. Only with the regional movements of the 1970s and 1980s do we find, for the first time, purely secular and economic issues being raised to the forefront, and it is only now that the Centre seems most maladroit.

During the linguistic movements the Centre had to preside over the re-shaping of the administrative structure and boundaries of its constituting elements but as it did not have to deny the linguistic demands of any major linguistic group by acquiescing in the linguistic demands of another, we witnessed, as was mentioned above, a celebration of differences which defied the western model (which is also the RSS model) of a nation state. The nativist movements too provided no major challenge to the Centre for the ruling party in Delhi was never threatened by nativist movements. On the other hand, the latter was always willing to be co-opted into the former. There could be no better example of this than the Shiv Sena of Bombay. But with regional and secular movements the ruling party at the Centre, more particularly the Congress(I), was for the first time faced with a political formation that was hostile to it. Now was the time for the Centre to strike back. And the Centre struck back ethnically. It ethnicised secular issues in order to marginalise its opponents, one by one, from the national mainstream. The fact that the demarcation of state boundaries is superimposed by linguistic and/or religious markers provided the temptation for the regional political formations to lapse into the ethnic slot the Congress(I) was pushing them into. While Farooq Abdullah and N T Rama Rao came periliously close to it, the Akali Dal blundered straight into it.

The Centre's policy of ethnicising regional demands in Punjab was aided not merely by the fact that it was the Akali Dal that was playing the leading agitational role, but also because the Congress was able to place a communalising catalyst in the shape of Bhindranwale. It may be recalled that Bhindranwale's candidates were wiped out in the SGPC elections in 1979. But Bhindranwale was able to overcome this humiliation with the help of the state government. He was arrested for the murder of Lala Jagat Narain in 1981 but then the government dramatically released him. The manner in which he was arrested and released created an aura around Bhindranwale. The '*Sant*' had made it known that the police could arrest him only after he had spent a week in meditation in his hermitage, and he laid down the further condition that only proper *khalsa* Sikhs with open beards should be sent to take him into custody. The government acceded to this unprecedented request, and that too to a man who had, at that point, no standing in the Sikh community. His release soon after from prison added dramatically to his charisma. It was hard to believe that only a year back his candidates supported by the Congress were routed in the SGPC elections.

From then on Bhindranwale's prestige kept soaring. He bucked the Akalis to a pace and to a style of politics they were just not in the shape for. Sikh fundamentalism which did not figure even during the Master Tara Singh-led Punjabi Suba movement began to gain salience with the emergence of Bhindranwale. Operation Bluestar almost canonised him and for a while it seemd that Longowal had thrown in the towel. But he rolled with the punch and is finding his feet again.

Fortunately for Punjab, Longowal is not allowing the ghost of Bhindranwale to act as an *eminence grise* any longer. To this end he has publicly distanced himself from the faction led by Bhindranwale's father and Jathedar Talwandi. Fortunately too for Longowal he was able to assert his leadership over the Akali Dal on June 9, 1985 in Manji Sahab. Fortunately too, there are many economic, sectional, and old fashioned idealist interests left in Punjab which together, for different reasons, want the tangle to be sorted out fast and to unmake the communalising of Punjab. But unfortunately every day of procrastination only succeeds in communally titillating the environs, every instance of unwarranted police or paramilitary atrocity only aggravates the situation further. The Sikhs are not yet used to subservience. Their economic strength and prosperity allow them the extravaganza of defying the victimisers. But once the mirror image of Hindu communalism is reflected in Sikh communalism, then in the final climax of wargasm the fundamentalist Sikhs will ride the Congress(I) and turn the clock back for a long time to come. Well, might many say, good riddance like they said to Pakistan in 1947. But just think of the devastation of lives, the profligate expenditure of mortality, and yet another crippled limb that will never grow again like the heads of cabbages and kings do. We are all prepared after a fashion, to expect a wasted denouement, but one is never prepared enough for an irrevocable and avoidable disaster.

## Notes

[I have greatly benefited from discussions with Gautam Navlakha. I alone am, however, responsible for the shortcomings of the paper.]

2 See, "Black Laws in Punjab", People's Union for Democratic Rights (PUDR), New Delhi, 1985.

3 Scheduled Caste Sikhs such as the Mazhabis are known for their anti-Jat Sikh, and hence anti-Akali Dal, political preferences. For instance, over 90 per cent of the left organisation, the *Khet Mazdoor Sabha*, is made up of Mazhabi Sikhs. Giani Zail Singh was also successful in mobilising a large number of Ramgarhia Sikhs into the Congress(I). He himself is a member of this community. However, the Operation Bluestar seems to have obliterated these differences. The best illustration being the Scheduled Caste origins of both Satwant Singh and Beant Singh, the assassins of Indira Gandhi. It is also undeniable that the Delhi Sikhs who were in the past with Congress(I) openly supported opposition candidates in the 1984 parliamentary elections.

4 For a moving account of this, see Baljit Singh Malik, 'To Dare to Belong', *Lokayan*, New Delhi, 1985, Vol 3, No 1, pp 29-41.

6 The CPI(M) in two separate resolutions first praised Operation Bluestar and then criticised it. In the first resolution on June 3, 1984 they blamed the Akali Dal alone. The second resolution of June 6, 1984 they blamed both the Akali Dal and Congress(I). (*Statesman*, June 12, 1984). Even H S Surjeet of the CPI(M) charged the Akali Dal for separatist tendencies (*Times of India*, March 25, 1984). The CPI has been more unambiguous and consistent. It publicly proclaimed great relief that the Operation Bluestar had taken place (*Times of India*, June 7, 1984) and has not found it necessary to modify this position since.

15 According to one estimate the rate of return on wheat for Punjab farmers fell from 27.28 per cent in 1972-73 to as low as 10.89 per cent in 1978-79. In 1977-78 it was an unbelievably low as 1.32 per cent. See Sucha Singh Gill and K C Singhal, 'Punjab: Farmers Agitation—Response to Developmental Crisis in Agriculture', *Economic and Political Weekly*, 1984, Vol 19, pp 1728-32; see p 1729.

16 These facts came to light in the military court-martial proceedings as Jabalpur on June 3, 1985.

# Irrigation Performance during Drought

**B D Dhawan**

*The extent to which agricultural growth is accompanied by increasing instability in crop output has been adequately probed. But the behaviour of crop output during drought years, both under irrigated and unirrigated conditions, has not been subjected to any thorough analysis.*

*The impression is that the Indian irrigation system is itself vulnerable to drought. Since the irrigation system extends to hardly 30 per cent of the country's crop acreage, it is conceivable that the diminution in crop output during drought could be mainly confined to the unirrigated segment of the farm sector. In that case the expert opinion about irrigation affording substantial insulation against drought appears plausible in a limited sense. This paper seeks to verify this insulation hypothesis.*

## Introduction

IRRIGATION is developed with a view to augmenting farm output, as also insulating rural economy against the calamity of failure of rains. While the output-augmenting role has been well investigated by research scholars, the same cannot be affirmed about the other role, namely, income and output stabilisation. To what extent added crop output ensuing from multifarious development programmes for the farm sector turns out to be more unstable than the earlier output—i e, to what extent agricultural growth is being accompanied by increasing instability in crop output—has been probed by a number of scholars (S R Sen, C H Hanumantha Rao, S K Ray, Peter Hazell, Shakuntla Mehra, B D Dhawan, S P Pal, etc). But the behaviour of the crop output during drought years, both under irrigated and unirrigated conditions, has not been subjected to any thorough analysis. It is, therefore, not surprising that one comes across contrary views on this matter.

When a drought appears to be of modest severity and grain stocks are high, the daily media carry assurances (emanating mainly from the Yojana Bhawan and the Krishi Bhawan) to the effect that there is no cause for alarm as irrigation has substantially insulated Indian agriculture against drought. This is in contrast to the widespread complaints emanating from the irrigators during the course of a drought that the water supplies from the irrigation works are inadequate in relation to demand. These periodic complaints have given rise to the impression that the Indian irrigation system is itself vulnerable to drought, an impression that is reinforced by the substantial reduction, revealed by subsequent release of grain output statistics, for the drought years. Since the irrigation system is hardly extended to 30 per cent of the crop acreage of India, it is conceivable that the dimunition in crop output during drought could be mainly confined to the unirrigated segment of the farm sector. In that case, the expert opinion about irrigation affording substantial insulation against drought appears plausible in a limited sense, namely, irrigation insulates substantially the irrigated segment, and not the whole farm sector, against drought. The cardinal question is: how does one go about verifying this insulation hypothesis?

## Methodology

Scholars and irrigation administrators, who have examined *ex poste* the protective role of irrigation works established during the British rule, quantitatively assessed the changes in irrigated crop area within a canal command (or a region served by one or more canals) during a drought. This irrigated area approach was necessitated by the absence of crop output statistics at individual canal command level. Stability of this area statistic (or its rise) during a drought period was, however, no guarantee that irrigated output did not fall below its normal level due to aridity and hot winds of the drought period. Thus, the irrigated area analysis provides only partial insights into the protective role of irrigation. Fuller insights can emerge from an analysis of crop output and crop income statistics, both of which have also a bearing on incomes of the landless classes—especially of agricultural labourers and village artisans.

So long as crop output statistics are not separately available for both the irrigated and the unirrigated segments, one has per force to take recourse to a time series of total output data from which one has to select at least two drought years which are of comparable intensity but are separated by a length of period during which the irrigation system has expanded perceptibly enough to make a marked difference to crop output. To the extent crop output during the latter-period drought of more irrigation facility is found to be less adversely affected in comparison to the earlier-period drought, one may conclude postively about the stabilisation role of irrigation. While computing the adverse impact, if any, the usual procedure adopted by scholars is to assess a normal magnitude of output for the drought year. It is against this normal magnitude (derived either as some trend value or an average value of the few years preceding the drought year) that the adverse impact of drought on output is adjudged. The pitfalls encountered in this approach need to be enumerated so that both the researchers and their readers can be on guard against erroneous inferences. First, it is very difficult, if not impossible, to select two drought years of comparable intensity. To go by the deficiency in normal rainfall during a year can be an inadequate measure of drought intensity. For, a deficiency in rainfall which occurs early in the wet season can affect crop output differently from one that is encountered in the middle of the season, or towards the end of the season. Again, a drought in one year may be preceded by a drought or above normall rainfall year, or a drought in one region is accompanied by a pervasive drought all round. Thus selection of two drought years of comparable intensity can prove faulty, giving rise to faulty conclusions about the protective role of irrigation.

Secondly, the results can be confounded if *ceteris paribus* clause of comparative analysis is violated. The two drought periods, even if of comparable intensity, may differ, among other things, in respect of (i) the underlying procedures employed for estimation of crop outputs; (ii) farm production incentives (e g, price support policy, production subsidies, government levy and other procurement schemes, etc); and (iii) the farm technology. The role of these factors cannot be so easily disentangled from the output impact of drought *per se*.

Thus drawing inferences from the behaviour of output in two comparable droughts can indeed be hazardous. The root of these hazards is the task of assessing what might have been the decline in output had there been no irrigation at all in the drought year. Though the task belongs to the realm of speculation, some workable methods have emerged from the literature on cost-benefit analysis. We wish to adopt these methods in this paper, though duly bearing in mind their own peculiar pitfalls.

The investigation is being carried out at the state level. For the period of the seventies, during which most states in India experienced at least one severe drought, such states are selected for which estimates of crop yield for principal crops are available both for the irrigated and the rainfed conditions. These estimates, taken alongwith crop area statistics, help us in building separate estimates of aggregate crop output for the irrigated and the rainfed segments of state agriculture. Using the rainfed segment as a 'control' for the irrigated segment, we assess the comparative performance of the irrigated segment *vis-a-vis* the unirrigated segment during a selected drought year. That is, per cent dimunition in aggregate irrigated output from normal or trend value (if any) during a drought year is compared with the corresponding diminution in the aggregate unirrigated output. If the former approaches zero, irrigation is inferred to confer total insulation against drought. If it is relatively less in magnitude than the latter, a case of partial insulation against drought is indicated. Only when the former exceeds the latter by a perceptible margin, one can conclude absence of a protective role of irrigation.

The principal pitfalls to be guarded against in this with-and-without approach are two-fold: (1) those which stem from the well-known limitations arising from the choice of a 'control' and (2) the externalities imposed by irrigated agriculture on unirrigated agriculture when both co-exist side by side. Let us first set forth the problem of externalities. The adverse external effect of irrigation on rainfed farming arises from (a) concentration of attention and resources on irrigated plots by farmers having partially-irrigated holdings and (b) diversion of traditional productive resources of adult male labour and farm yard manure from dry tracts to adjacent canal tracts where demand for traditional productive resources may rise steeply in the wake of irrigation. These adverse effects have been pointed out in the literature by a few very discerning scholars (D R Gadgil, Scarlett Epstein, V M Rao, etc). We believe that these adverse effects are a phenomenon of the initial stage of irrigated farming. These effects gradully vanish and are later reversed in direction (i e, these become beneficial effects) during the mature stage of irrigated farming. Anyway, the truly beneficial effect of irrigation on rainfed farming is a real possibility during drought time. This can arise *via* (a) the beneficial change in micro-climate due to extra evapo-transpiration from irrigated fields and (b) the roots of the rainfed crops tapping some of the seeped waters from the adjacent irrigated plots and the irrigation channels. In that case, per cent dimunition in rainfed output during a drought may be smaller than one that would have arisen in the absence of irrigation development. To what extent this underestimation is countered by the adverse externalities referred to above is as yet undetermined.

Among the usual pitfalls posed by a 'control', one has to ascertain that the drought in question did not impinge on the irrigated and the unirrigated segments of farm sector of a state in a differential manner. Such a possibility exists for large states—as indeed are most Indian states—where irrigation is not evenly distributed over space. For, drought may differ in intensity across regions of a state. Even where irrigation appears to be evenly spread on the basis of district-wise data, irrigation may be confined to heavier soils of the valley lands and the rainfed farming practised more on the shallower, eroded soils of the uplands. If that be the case, the output decline in the rainfed segment overstates the decline that could have occurred in the irrigated segment under natural conditions.

Finally, since the dependability of irrigation during drought has come to be recognised *inter alia* in terms of (a) source of irrigation and (b) characteristics of a source of irrigation, it is imperative to carry out an analysis of crop output for each source of irrigation separately. In the absence of source-wise yield (and area) statistics, we adopt the following stratagem, whence such districts within a state are identified as are dominated by a single source of irrigation. Inter-source performance in this paper is derived from such a sub-state analysis of irrigated crop output. Needless to add, such inter-source analysis also suffers from intra-state disparities in climate, soil, topography, etc. Though an attempt has been made to eliminate the effect of spatial difference in drought intensity—this is done by computing output elasticity with respect to rainfall deficiency—the results continue to be more of an indicative than cardinal value.

## The Data Base

The results are based on the drought of 1972-73 in the case of Madhya Pradesh, Bihar and Andhra Pradesh, and the 1974-75 drought in the case of Punjab, Haryana, Gujarat and Tamil Nadu. Most of our time series of output commence in 1970-71, by which time yield estimates based on crop cutting experiments (known as GCES estimates in contrast to 'annawari' estimates in vogue at the time of the British departure from India) were being compiled for the selected states on an extensive scale. The series could not be extended to include the drought of 1979-80 and 1982-83 because of a great lag in the availability of crop-wise irrigated statistics. The author hopes that some scholars would reappraise the results of this paper on the basis of experience of the subsequent droughts, especially those of 1979-80 and 1982-83 when grain output fell markedly.

As for disaggregative analysis, we have not proceeded beyond two main crop groups, namely, foodgrains and non-foodgrains. A more disaggregative analysis has been deliberately avoided for a variety of reasons, of which the following need specific mention. One is the lack of firmness of yield statistics at crop level—in an aggregative analysis one hopes for some cancellation of errors in the opposite directions. The second is the smallness of the set of crops for which output statistics are available both under irrigated and unirrigated conditions for a state.

Aggregation of diverse crop outputs has been carried out by using calorific units of crops as weights. Wherever the crop diversity does not permit the use of such a weighting scheme, constant farm harvest prices are employed for aggregation. We believe that the results of this paper are totally unaffected by the choice of the weighting scheme.

## Empirical Findings

### PUNJAB STATE

We begin with Punjab, the state with the highest growth rate in agricultural production. After the construction of the Bhakra and the Pong reservoirs the dependability of canal irrigation of the state improved substantially. Similarly, the extensive development of private tubewell irrigation (which totally displaced private dugwell irrigation) since the early sixties not only enhanced the dependability of groundwater irrigation but also added to the overall quality of the whole irrigation system of the state. Not only was the intractable problem of rising water table duly arrested but the conjunctive use of groundwater and surface water added to the farmers' flexibility in irrigation operation. One aspect of this flexibility is that tubewells during a drought can pump additional water from deeper underground reservoirs that are immune to the drought of that year. Thus, the extra demand for irrigation water arising either due to a shortfall in canal supplies on account of rainfall failure or due to enhanced evapo-transpiration needs of plants on account of dry weather (or both) can be met with the tubewell mode of irrigation so long as pumping operations are not curtailed by an energy crisis.

During the severe drought of 1974-75, when rainfall was 37 per cent below the state normal level of about 580 mm, there was hardly any downturn in the irrigated output of the state. Taking due note of the uptrend in irrigated acreage and irrigated yields, one may place the 1974-75 irrigated output to be about five per cent below its trend value for that year. This is indicative of a high order of insulation against drought. Both the tubewell-irrigated tracts and the canal-dominated tracts reveal a high order of protection from drought. In the extremely low rainfall region of Bhatinda and Faridkot districts where canals are the main source of irrigation, rainfall was 46 per cent below normal (440 mm), and yet the irrigated output was barely one per cent below its trend value for that year. Similarly, the irrigated output of the main tubewell region of the Central Plains (comprising of the four districts of Ludhiana, Jullundur, Patiala and Kapurthala) tended to stay-put on its historical course despite rainfall of this region dropping 43 per cent below normal (675 mm).

Because of the extensive development of irrigation on the one hand and the rainfed farming prevalent on (i) high rainfall, submontane region adjacent to the cool Himalayas and (ii) water-logged areas and riverine lands of high moisture content on the other hand, the performance of the irrigated segment during the drought of 1974-75 exihibited a high insulation to drought. Taking due note of the persistent downtrend in the output from the shrinking rainfed segment of the state, the decline in output amounted to three per cent below the trend magnitude. However, this cannot be taken as a foil or 'control' for irrigation which provides a beneficial spillover on the rainfed plots. A more appropriate indicator of what would have been the shrinkage in farm output without irrigation development altogether is provided by the neighbouring Haryana state where a comparable drought in the same year (rainfall 32 per cent below the normal level of 720 mm) led to a reduction of 42 per cent (below trend value) in output of the rainfed segment. Of course, the impact of the drought in Haryana on its rainfed agriculture was accentuated by the proximity of this state to arid western Rajasthan which also witnessed a severe shortfall in precipitation during the same time (50 per cent below its normal rainfall of 310 mm). Punjab's greater proximity to the cool Himalayas than to the arid Rajasthan should bring a somewhat lower reduction in output under wholly rainfed farming than is suggested by Haryana's figure of minus 42 per cent.

### HARYANA STATE

The irrigated output of Haryana state showed a marked downturn during the drought of 1974-75, falling 15 per cent below its trend value. Bulk of the fall is traceable to a reduction in crop yields. Furthermore, the reduction in the output of the foodgrain group is somewhat higher than that for the non-foodgrain groups—a similar differential is observed in Punjab too. When irrigated foodgrains are contrasted with unirrigated foodgrains, one is struck by the substantial protection afforded by irrigation during a drought: while the output of unirrigated foodgrains shrank by 49 per cent, that of the irrigated foodgrains fell by only 19 per cent. This is a noteworthy result on two counts: (1) the unirrigated foodgrains are dominated by less-water using millets, barley and pulses which possess intrinsically higher tolerance for rainfall deficiency and (2) the irrigated foodgrains comprise mainly of wheat and paddy, grown largely with HYV seeds possessing lower tolerance limits for water stress. Thus irrigation accompanied by a radical change in crop pattern or crop varieties need not add to output instability so long as it is dependable during drought time.

In the matter of reliability, the irrigation system of Haryana cannot be rated as high as that of Punjab—this mainly accounts for the superior performance of Punjab irrigation during a drought. Firstly, private tubewell irrigation in this state is comparatively less important in relation to canal irrigation. Secondly, canal irrigation is comparatively less backed by storage reservoirs—the western Yamuna Canal is simply a diversion work. Thirdly, Haryana has to share canal waters with Punjab (Bhakra) and UP (Yamuna river)—canal sharing arrangements are liable to come under strain during drought to the detriment of areas in the lower reaches of the canal network.

### GUJARAT STATE

This is another state where the output protective role of irrigation was highly commendable during the severe drought of 1974-75 when rainfall was 55 pepr cent below the state normal of about 725 mm. (The rainfall deficiency is computed with the aid of district-wise rainfall data of the state *Season and Crop Report*; the region-wise statistics compiled by the Meteorological Department of the Central government indicate a higher rainfall deficiency—66 per cent in Gujarat region and 69 per cent in the Saurashtra and Kutch regions.) The reduction in crop output of the irrigated segment was of the order of 19 per cent, three-fourths of which could be traced to the yield effect alone. Once again, the set of foodgrain crops exhibited slightly higher (21 per cent) dimunition than non-foodgrains; yet this dent by the drought was way below the dent (54 per cent) produced in the foodgrains output originating from the purely rainfed segment. The substantial output protection afforded by the irrigation investments is abundantly evident from the fact that overall the irrigated output declined by 19 per cent in comparison to the 55 per cent decline in the rainfed output.

Gujarat state, more particularly its Saurashtra and Kutch region, suffered a series of bad weather years during the first half of the seventies. While in the case of the Saurashtra and Kutch regions the drought of 1974-75 was preceded by two successive years of rainfall failure (58 per cent and 20 per cent below normal in 1972-73 and 1973-74, respectively), the Gujarat region had good rains during 1973-74 (36 per cent above normal) but poor rains during 1972-73 (44 per cent below normal). For reasons of these considerations—taken alongwith the fact of a comparatively high rainfall deficiency during 1974-75 itself—the adverse performance of both the irrigated and the unirrigated segments of the state agriculture turns out to be unduly high. This needs bearing in mind in any inter-state, comparative analysis of performance of agriculture during a drought.

Probing into the parameters that determine the dependability of the irrigation system, one finds the state canals are duly backed with storage works. However, canals hardly provide one-fourth of the total irrigation. Three-fourths of the irrigation is supplied by groundwater sources; tubewells and dugwells contribute irrigation in the proportion of 1:3. It must, however, be pointed out that in this state many groundwater structures, which are recorded as tubewells in the northern states of Punjab, Haryana and UP, are listed in the category of dug-cum-bore wells, and not tubewells. This implies that the intrinsic dependability of groundwater means of the state is higher than that apparently indicated by the relative share of tubewells vis-a-vis dugwells. Anyway, with regard to the dependability of deep dugwells and shallow tubewells, during the distress time of a drought, scholars must bear in mind the possibility of deleterious consequences on groundwater availability in the season following the drought year. In other words, the protective role of well irrigation during drought has to be appraised alongwith any penalty in output due to diminished groundwater supply (or reduced use of groundwater due to increased cost of pumpage due to excessive lowering of the water table during the drought year) borne by well owners in the subsequent year. Chances for such output penalty are high if (i) the subsequent year is also one of serious rainfall deficiency, (ii) the groundwater table is secularly receding on account of excessive development of well irrigation (including installation of heavy duty tubewells for meeting industrial and urban civil demand for drinking water) and (iii) the natural recharge of groundwater is poor, because of geological, climatic and topographical reasons. The delayed impact of drought on dugwell irrigation is briefly explored in the case of Tamil Nadu which is next taken up for discussion.

### TAMIL NADU

Tamil Nadu, which also experienced a drought during 1974-75, is an instructive case in more than one respect. First, crop yield estimates are, comparatively speaking, firm for both the irrigated and the rainfed segments. Second, all the principal sources of irrigation—tanks, tubewells, canals and dugwells—are encountered to permit some analysis of inter-source performance during a drought. Third, it is the first state for which results do not sustain the hypothesis that irrigation affords protection against drought, thereby stimulating a search for factors that erode the protective role of irrigation.

According to the Meteorological Department, the rainfall deficiency during 1974-75 was 31 per cent of the normal value of about 1000 mm—the district-wise data on rainfall, as published in the state *Season and Crop Report*, indicate a comparable deficiency of 32 per cent below normal. On the whole, the overall irrigated crop output fell 25 per cent below its expected value under normal conditions. Once again, the output of irrigated foodgrains is found to be dented slightly more than the non-foodgrains crop group. The adverse output impact results from reductions in both area and crop yield—12 per cent in irrigated area and 15 per cent in the overall irrigated crop yield. The corresponding decline in the rainfed agriculture was comparable to that of the irrigated agriculture, namely, 23 per cent below normal. (In the matter of agricultural output instability—as measured by the coefficient of variation—the irrigated segment of the state was found to be as unstable as the rainfed segment.)

From the viewpoint of dependability of the state irrigation system, one cannot rate it highly. Tubewell irrigation constitutes a tiny fraction (four per cent during 1978-79) of total irrigation, in which tanks that are known for their vulnerability to drought, account for one-third—the rest is equally shared between dugwells and canals. Canals are not fully backed by massive storage reservoirs, with a good deal of the catchment areas of the rivers lying outside the state, which is having a serious dispute on water sharing with the upper riparian state of Karnataka. Finally, the groundwater resource, which has mostly contributed to the development of new irrigation facilities since the mid-sixties, is under pressure due to overexploitation at several places.

Let us now explore source-wise performance. In the Pudukottai district, where tanks are the primary source of irrigation, the drought of 1974-75 was very severe indeed, with recorded rainfall dropping by about 55 per cent below the district normal of 925 mm. The irrigated output, with paddy as the pre-eminent crop within tank commands, shrank by 88 per cent. In comparison to Pudukottai, the drought in canal-irrigated Thanjavur district (this district accounts for half the canal acreage of the state) was less severe, causing a smaller dent in output. More specifically, consequent upon a 36 per cent reduction in normal rainfall of about 1170 mm of this deltaic district of alluvial soils, the overall irrigated output of the district (dominated by the paddy crop) fell 14 per cent below its normal value. The less-than-proportionate impact of the drought is partly attributable to normal rainfall conditions in the upper catchment of the Cauvery river, the principal source of canal waters in the state.

As for dugwell irrigation, we have analysed the data for two districts separately. These districts are Salem, where dugwells alone dominate in the irrigation system of the district, and Coimbatore where dugwells are used in conjunction with canal waters—to promote such conjunctive use the Lower Bhavani Canal is so scheduled that canal beneficiaries in odd-numbered distributaries receive water in one year and the even-numbered in the next year. The rainfall deficiency in Salem district—23 per cent in 1974-75 and 17 per cent in the preceding 1973-74 (N = 840 mm)—produced 22 per cent dimunition in irrigated output. The delayed effect of the drought of 1974-75 is noticed during 1975-76 when output was about 17 per cent below normal despite deficiency in rainfall during that year being only 11 per cent. In the case of the Coimbatore district, where dugwells and canals are of equal importance in total irrigation, the rainfall deficiency during 1974-75 was of the order of 26 per cent (N = 720 mm) though preceded by a 39 per cent deficiency in preceding 1973-74. Despite the greater severity of the two droughts in this district than in Salem district, the output reduction amounted to only 14 per cent. More importantly, one does not discern any lag effect on output during 1975-76 when a rainfall deficiency of 11 per cent occurred in this low rainfall district. This demonstrates the role of canal seepage in enhancing performance of well irrigation both during drought and after drought. If tank water supplies are also strengthened by promoting groundwater development in tank commands, the seepage of tank water, if tapped through dugwells and tubewells, can not only enhance the productivity of tank-irrigated farming but also impart it much-needed stabilisation.

The output performance of tubewell-irrigated tracts could not be assessed as there is no district in the state where tubewells alone constitute the mainstay of irrigation. All that we could unearth through analysis of tubewell aereage data is the noteworthy area flexibility of this mode of irrigation. The net irrigated area under tubewell irrigation, instead of undergoing a reduction during drought time, tends to expand. Part of the expansion could be due to governmental and other endeavours to establish new tubewells under crash programmes undertaken invariably in the midst of a drought. Adjusting for this factor, the area elasticity during drought for this mode of irrigation is around minus 1.4 as per the statistics of South Arcot district which has witnessed a noteworthy development of tubewell irrigation under private aegis. This means that a tubewell can extend irrigation to 28 per cent additional area if a drought of 20 per cent intensity occurs. Such a flexibility on a much lower scale is observed in the case of dugwells also. During the comparable droughts of 1968-69 and 1974-75 dugwell area elasticity with respect to drought intensity was minus 0.14 for the 1968-69 drought and minus 0.07 for the 1974-75 drought.

### ANDHRA PRADESH

Like in Tamil Nadu, the performance of irrigated agriculture during a drought in Andhra Pradesh is no better than that of rainfed farming. This is not surprising for two reasons. First, the two states have comparable irrigation sources—Andhra is fortunate that it has no noteworthy water disputes with other riparian states and it has no problem of overdevelopment of groundwater resource. Second, farmers in both the states reveal a marked preference for paddy over dry crops (millets, pulses, jowar and oilseeds) once they get access to irrigation. This is to some extent a forced choice in the case of surface irrigation works located in medium rainfall tracts. For, in the absence of individul field channels, field-to-field distribution of water takes place. Under such a water regime, dry crops are prone to suffer from periods of excess moisture that is best coped with by an aquatic plant like paddy.

Andhra Pradesh was fortunate to escape from the nation-wide drought of 1974-75, which was mainly confined to the coastal region of the state, without any deleterious impact on irrigated output. To begin with, the drought was modest in severity (21 per cent below normal rainfall in the Coastal Andhra region). Secondly, the drought occurred in the deltaic region having considerable waterlogging on the one hand and extensive development of individually-owned shallow tubewells ('filter points') on the other hand. When we turn to the more serious drought of 1972-73 which was an extremely bad year in the annals of the entire Deccan Plateau, the rainfall deficiency for the state as a whole was modest (being 18 per cent below the normal of 890 mm) but the Telengana region (which lies in the Deccan) witnessed more deficiency (32 per cent below normal as compared to six per cent deficiency in Rayalaseema and a one per cent deficiency in the coastal Andhra region). Yet, the drought made a serious dent in irrigated output which could be rated 28 per cent below trend value. This more than proportionate impact of rainfall deficiency on output arose because of the following reasons. One, the drought followed another drought in the preceding year when rainfall was 34 per cent below normal in Telengana, 27 per cent below normal in Coastal Andhra and 12 per cent below normal in Rayalaseema, implying thereby reduced groundwater availability in the subsequent year. Two, the drought was pervasive in the upper catchment of the Andhra rivers that fed Andhra canals which supply 47 per cent of the irrigation in the state. Three, the drought intensity is understated for 1972-73; the drought set in early in the kharif season (the main crop season of the state) and lasted till the end of September—the South-West monsoon deficiency was 40 per cent in Telengana, 27 per cent in Coastal Andhra and 25 per cent in Rayalaseema, amounting to a 33 per cent deficiency for the state as a whole. The corresponding dimunition in the output of kharif-irrigated crops of the state was 28 per cent below normal which was marginally less than the 32 per cent reduction observed in the rainfed output of the state for the same kharif season.

### BIHAR

At the very outset, it may be mentioned that the results for this state are of a preliminary nature. Since Bihar escaped from the drought of 1974-75, let us examine the impact of the 1972-73 drought. This year the South-West monsoon failed in the plains region by 40 per cent and by 16 per cent in the plateau region. The rainfall deficiency for the whole of 1972-73 averaged 26 per cent below normal (1240 mm) for the plains region, where the bulk of the state irrigation facilities are concentrated. The deficiency for the state as a whole amounted to about 30 per cent below normal. The irrigated output fell 25 per cent below its normal level (much of it due to shrinkage in crop yields). For this relatively high susceptibility to rainfall failure, one explanation would suffice. Though a variety of irrigation sources exist in the state, their reliability is low. Tubewells, both public and private, account for only one-fifth of the toal irrigation. But then the rural electric supply system of the state is weak—this is to be taken along with the poor management of public tubewells. Public canals constitute two-fifths of the total irrigation but are mostly of the diversion type—and their management is poor, more so during drought time. Both tanks and dugwells are of minor importance. The remaining sources (pynes, bundies, etc) can be rated no better than tanks in the matter of productivity and dependability during drought.

In contrast to rainfed agriculture, irrigated agriculture in Bihar shows up in an unfavourable light. While the rainfed output was dented to the extent of 14 per cent, the dent in irrigated output due to the drought was of the order of 25 per cent. It is quite plausible to envisage that in a very high rainfall area like Bihar, a rainfall deficiency of 30 per cent still leaves enough moisture for rainfed crops to mature without there being a proportionate reduction in output. On the other hand, a precariously irrigated agriculture can cave in due to a reduction in availability of irrigation supplies during drought. But before affirming such a plausible view, we invite readers' attention to the fact that the Bihar data—more so the data in respect of its rainfed segment—revealed some crass discrepancies which should caution us about the veracity of our findings. Let me illustrate this. Both the rainfed yield and the unirrigated area under wheat crop for 1972-73, as reported in the state statistical reports, were out of alignment of the whole time series under analysis. While the rainfed wheat area jumped to 1705 thousand ha (the range of the series being 529-684 thousand ha), the yield jumped to 912 kg/ha (the range of the series being 233-560 kg/ha). If no corrections were made for these questionable jumps in a crop that has considerable weight in the rainfed segment, we would have the preposterous result of output of the whole rainfed segment during the 1972-73 drought being higher than that of 1971-72, a year of above normal rains (16 per cent in Bihar plains and 24 per cent in Bihar plateau).

### MADHYA PRADESH

One does not come across a serious drought year in this sprawling state of good rainfall conditions during the seventies. Keeping in mind that departure upto 19 per cent from normal rainfall is viewed with equanimity in the official agricultural circles (such a year is dubbed as a 'normal' year), the 25 per cent deficiency in west Madhya Pradesh (N = 1070 mm) and 14 per cent deficiency in east Madhya Pradesh (N = 1140 mm) during 1972-73 are not indicative of serious water stress. Yet, the irrigated output fell 14 per cent below its expected magnitude; while the overall crop yield of the irrigated segment fell by 17 per cent, the irrigated area did expand by five per cent above its trend value. With little tubewell irrigation, the dependability of the state irrigation facilities cannot be placed on a high rating. Though tank irrigation is of minor significance, yet canals (43 per cent share) and dugwells (40 per cent share) are not reliable during drought—the dugwells are quite shallow.

Given the modest nature of rainfall deficiency, one is struck by the low protective performance of irrigation, more so when the rainfed output emerged totally unscathed from the drought. It is no doubt true that area-wise the irrigated segment is almost one-tenth of the rainfed segment, Also, wheat and rice dominate the irrigated segment whereas the rainfed segment consists of a highly diversified crop pattern in which low water-using crops with higher tolerance limits for water stress are duly present—pulses alone constituted 28 per cent of the total unirrigated area during 1972-73. If we restrict our comparison of the two segments of wheat and rice crops only, one observes hardly any difference in the performance of the two segments. More specifically, the combined output of irrigated wheat and irrigated rice fell by 19 per cent as compared to the 18 per cent fall in the combined output of rainfed wheat and rainfed rice. While this does indicate absence of a protective role of irrigation in the state, prudence demands more investigation of the matter with the help of the data for a really severe drought year for this state of rather high rainfall.

## Results of Inter-State Comparison

The inter-state comparison is being undertaken more with the view to (a) sizing up the results of our analysis in a summary form and (b) drawing inferences about the comparative performance of various types of irrigation works during drought time than simply assessing state-wise variations in the protective role of irrigation during a drought. For one reason, the state-wise variations based on the experience of a single drought year do not warrant the inter-state comparisons. No less important in this context is the uniqueness of each drought that renders even a temporal comparison for a single state of questionable validity, not to

TABLE : SELECTED STATE-WISE AND SOURCE-WISE RESULTS OF DROUGHT IMPACT

| State/Source of Irrigation | Normal Rainfall (mm) | Year of Drought | Intensity of Drought (Per Cent) | Elasticity of output w r t Rainfall Deficiency | | Remarks |
|---|---|---|---|---|---|---|
| | | | | Irrigated Segment | Rainfed Segment | |
| 1 Punjab | | | | | | |
| (i) Whole state | 583 | 1974-75 | 37 | 0.14 | 0.08 | (i) Beneficial external effects of irrigation on rainfed segment. |
| (ii) Canal irrigated area | 442 | 1974-75 | 46 | 0.02 | NA | (ii) Bhatinda and Faridkot districts. |
| (iii) Tubewell region | 674 | 1974-75 | 43 | 0.00 | NA | (iii) Districts of Ludhiana, Jullunder, Kapurthala and Patiala. |
| 2 Haryana | 721 | 1974-75 | 32 | 0.47 | 1.31 | Drought also in neighbouring Rajasthan state. |
| 3 Gujatat | 725 | 1974-75 | 55 | 0.35 | 1.00 | |
| 4 Madhya Pradesh | 1240 | 1972-73 | 20 | 0.72<br>(0.95) | 0.00<br>(0.90) | Figures in brackets for wheat and rice. |
| 5 Bihar | 1221 | 1972-73 | 30 | 0.83 | 0.47 | Data discrepancies in rainfed segment. |
| 6 Andhra Pradesh | 890 | 1972-73 | 33 | 0.85 | 0.97 | For kharif season only. |
| 7 Tamil Nadu | 997 | 1974-75 | 31 | 0.81 | 0.74 | |
| a) Tank (Pudukottai) | 923 | 1974-75 | 55 | 1.60 | NA | |
| b) Canals (Thanjavur) | 1168 | 1974-75 | 36 | 0.39 | NA | b) Mild drought in the catchment. |
| c) Dugwells (Salem) | 842 | 1974-75 | 23 | 0.96 | NA | c) Lag effect of the preceding drought year ( −17 per cent). |
| d) Dugwells (Coimbatore) | 718 | 1974-75 | 26 | 0.54 | NA | d) Conjunctive use of canal and well water. |

talk of inter-state comparisons. Our attempt to eliminate the distortion arising from the inter-state (and inter-source) differences in drought intensity of the selected droughts—by computing the elasticity of crop output with respect to rainfall deficiency (through a simple division of the per cent reduction in output by the per cent fall in total precipitation)—is not a wholly satisfactory course of action. To begin with, it ignores the time element in rainfall deficiency. Thirdly, it ignores the lag effect of rainfall condition of the years immediately preceding the drought year, or the spillover effects of a drought in the neighbouring regions.

The summary results are set out in the Table. In the case of the semi-arid states of rather precarious rainfall conditions, namely, Punjab, Haryana and Gujarat, the protective role of irrigation is tremendous. In the case of states of medium rainfall conditions, that is, Andhra Pradesh and Tamil Nadu, the protective role does not emerge. In the case of a high rainfall state, Bihar, the intriguing role of irrigation (in the sense of irrigated segment being more vulnerable to drought) is of questionable acceptance. A similar intriguing picture in the case of Madhya Pradesh is turned into one akin to that of the two southern states once the comparison is restricted to finer grains of wheat and rice.

Another noteworthy finding is that the crop group of foodgrains is found in most states to be slightly more affected during drought than the non-foodgrain crop group. This may be attributed to two factors. First, irrigated foodgrains comprise mainly of wheat and paddy, where HYV seeds have been extensively adopted by the irrigators. These seeds make exacting demand for water (i e, these have low tolerance limits for water stress). In the event of an early onset of a drought (or an advance knowledge that irrigation supplies are uncertain and inadequate), farmers are prone to cut back on their acreage under these crops. In case the drought develops later in the crop season, the yield may be adversely affected if the irrigation source lacks dependability. In either case of area or yield reduction by a considerable margin, adverse output effect can be considerable. In the case of wheat and rabi rice, the area effect is likely to predominate as these crops are sown when the south-west monsoon is already over; the extent of drought is thus fully known and farmers know better about irrigation availability from their own wells, as also from rivers and reservoirs. But for kharif rice bulk of the output reduction, if any, may be in terms of crop yield, and not crop area.

Second, non-foodgrain crops like sugarcane and cotton that are sown under irrigated conditions well before the commencement of the monsoon, are of long duration. In the event of a drought, farmers prefer to curtail their irrigation commitments to other crops and allocate their available water supplies to these highly, remunerative crops. Such preference is very marked in sugarcane tracts because sugarcane is a heavy user of all farm inputs, but with assured remunerativeness from sale to sugar factories govered by statutory price support for sugarcane.

## Main Conclusions

In this paper, the protective role of irrigation during a serious failure of monsoon rains has been appraised from the limited angle of crop output protection, without due assessment of irrigation's role in protecting incomes in the countryside as a whole. To the extent rural incomes are ultimately determined by farm output during drought, the insulation attained in crop output against drought with the aid of irrigation constitutes a major test of the protective role of irrigation. On this score, the evidence thrown up by our analysis of data for seven states of India is far from uniform. Of course, in a country of continental variations in natural endowment the experiences of man-made efforts are more likely to be diverse (and even contrary in direction) than be uniform.

In the case of Punjab, Haryana and Gujarat, states having precarious precipitation during the main south-west monsoon season, the protective role of irrigation emerges in good measure. In the case of Andhra Pradesh and Tamil Nadu states with medium rainfall conditions (normal level about 900-1000 mm compared to 550 to 750 mm for the three states of north and west India mentioned above) the protection afforded to crop output during drought is practically nil, in the sense that the diminution in output in the irrigated segment is comparable to that in the corresponding rainfed segment. For the two comparatively high rainfall states of Bihar and Madhya Pradesh (N = 1200 to 1300 mm), the irrigated segment turns out to be more vulnerable to drought than the corresponding rainfed segment. It must, however, be pointed out that (1) the results of Bihar are feared to be suffering from some glaring data discrepancies and (2) the results of Madhya Pradesh become similar to those of the two southern states when the comparison of the two segments of the farm sector is restricted to finer grains of wheat and rice.

Since the intensity of drought is found to diminish as one moves from a low rainfall region in the medium and high rainfall regions (as represented by the set of 7 states in our study), one must be on guard against concluding that protective benefits from Indian irrigation are inversely related with the rainfall level. (The temptation to infer such an inverse relationship is heightened by another inverse relationship of Indian irrigation, namely, benefits from irrigation are inversely related with rainfall.) In point of fact, the results of the inter-state (and intra-state) analysis should be taken more for their indicativeness of the comparative performance of the different sources of irrigation during a period of rainfall deficiency than for the comparative performance of irrigation among states during drought. Thus the highest vulnerability to drought is in respect of tank-irrigated farming for which the output shrinkage is much more than (i) reduction in rainfall below normal level and (ii) corresponding shrinkage in dry farming. Besides, timely repairs (including desiltation of tank-beds) and removal of encroachers on tank-bed land, tank irrigation needs strengthening through ground-water development within tank commands. Such conjunctive use of surface and groundwater can not only enhance the productivity of tank-based agriculture but also improve the quality of irrigation service (including its dependability during time rainfall failure).

In contrast to tanks, tubewells turn out to be quite immune to drought. Thus tubewells, especially when used in conjunction with surface irrigation works, offer a sure way of insulating agriculture against drought. However, this potentiality of tubewells can be eroded if public tubewells are not managed efficiently and crippling power shortages happen to plague the countryside. Deep dugwells and canals backed by storage reservoirs (or augmentation tubewells) are not far behind tubewells in the matter of protection against drought. In the case of dugwells the ill effects of drought on output may appear with a lag of one year. Thus, if two droughts come in a row, dugwell owners may suffer output losses during the latter drought unless dugwells are located within the canal or tank command where canal/tank seepage provides a useful antidote to reduction in natural groundwater recharge during a drought.

---

## Premier Vinyl Flooring

PREMIER VINYL FLOORING is setting up a Rs 9.85 crore project for the manufacture of a new range of PVC floor and wall coverings at Sikandrabad in UP in collaboration with Pegulan Werke of West Germany, a world-renowned giant in the field. The products to be manufactured include PVC floor coverings, PVC floor tiles, PVC sheets/films, PVC wall coverings and PVC coated fabrics (leather cloth). PVC sheets/films and leather cloth are at present manufactured in the country, but the other products will be introduced for the first time in India. PVC floor coverings and tiles find wide applications and, on account of superior properties, will have better acceptance than marble tiles. The capacity of the plant is 5.5 million metres per annum. The company will shortly enter the capital market with a public issue of 17.50 lakh equity shares of Rs 10 each at par, out of which shares worth Rs 85 lakh are reserved for allotment to non-resident Indians. The issue is managed by the Merchant Banking Division of SBI.

# Gujarat Kisan Sabha, 1936-56

L S Vishwanath

*This paper discusses the role and activities of the Gujarat Kisan Sabha during the period from 1936 to 1956. The first part of the paper deals with the relations of the Kisan Sabha with the Indian National Congress, which is important for understanding the role of the Gujarat Kisan Sabha. The second part describes the struggles launched by the Gujarat Kisan Sabha on behalf of agricultural labourers, small landowners and tenants, the areas where they were launched and the issues raised in these struggles. Finally, an attempt is made to assess the role of the Gujarat Kisan Sabha during the period under review.*

THIS paper covers the role and activities of the Gujarat Kisan Sabha during the period 1936 to 1956. The All-India Kisan Sabha was started in 1936 at Lucknow. The Gujarat Kisan Sabha was one of the provincial units of the All-India Kisan Sabha. In 1956, the Gujarat Kisan Sabha became dormant. The dormancy of the Gujarat Kisan Sabha was mainly due to the Tenancy Act of 1956 also known as the 'Tillers Day' Act. This Act unlike previous tenancy legislations had a marked impact in the districts where the Kisan Sabha had been working, namely, Kheda, Baroda, Mehsana, Surat and Broach. Hence two points of time have been chosen to review the activities of the Gujarat Kisan Sabha: 1936 when it was started as a provincial wing of the All-India Kisan Sabha and 1956 when it became dormant.

This paper is divided into three parts. The first part deals with the relations of the Kisan Sabha with the Indian National Congress. This is important for understanding the role of the Gujarat Kisan Sabha. The second part deals with the struggles launched by the Gujarat Kisan Sabha on behalf of agricultural labourers, small landowners, tenants, etc, the areas or districts where they were launched, the issues raised in these struggles, and so forth. Finally, an attempt will be made to analyse the role of the Gujarat Kisan Sabha during the period under review.

## KISAN SABHA AND CONGRESS

The Congress of the pre-independence days and even subsequently comprised diverse ideological viewpoints and leaders including rightists, centerists, socialists and, till 1948, even Communists. Within the Congress there was a socialist group which included leaders like Jayaprakash Narayan, Kamladevi Chattopadyaya and Acharya Narendra Dev. This group of Congress socialists wanted to start a separate organisation for peasants as part of the Congress organisation.[1] But this was vehemently opposed by Sardar Patel and some others. The Sardar masterminded the Bardoli Satyagraha of 1928 and emerged as an important national leader. He was a trusted lieutenant of Gandhi. Gandhi, when out of prison, was busy travelling from Kashmir to Cape Comorin mobilising support for the freedom struggle. Gujarat affairs were left by and large in the capable hands of the Sardar. For the Sardar, anything that smacked of socialism or leftism was anathema. With his peasant background and as a shrewd leader he knew that a peasant organisation formed at the initiative of leftists had all the dangers of being dominated by them. He, therefore, opposed it. At the time of the Lucknow Congress (1936) the Kisan Sabha was not a peasant wing of the Communist Party of India, as it became later. On the contrary, the idea of Congress socialists was to have a peasant wing within the congress.[2] But this did not happen. The Sardar opposed it. Even Gandhiji did not like the idea of a left dominated peasant organisation as part of the Congress. The Congress socialists had hopes of support from Jawaharlal Nehru, who was President of the Lucknow session. In the 1930s Nehru had his 'Marxist phase' and socialist leanings. He participated in the deliberations of the Kisan Sabha leaders at Lucknow. Nehru did not wish to antagonise Gandhi. According to the perceptive analysis of Nehru's 'Marxist phase' by Bipin Chandra, Nehru realised that his Marxist leanings would cost him the support of Gandhi. He, therefore, "came back to Bapu's fold".[3] At the Faizpur session of the Congress, Nehru opposed the formation of Kisan Sabhas. He said "for the benefit of Kisans there is need for an association, but where Congress is working for Kisans in villages, there is no need to start Kisan Sabhas". Nehru's speech angered the Kisan Sabha leaders like Shajanand Saraswati (from Bihar) and Indulal Yagnik (from Gujarat). The leftists', especially Congress socialists', hopes of forming a peasant organisation within the Congress fold were disappointed. At Faizpur, the Kisan Committee adopted the CPI's red flag as the All India Kisan Sabha's flag and thereafter for all practical purposes the Kisan Sabha became the peasant front of the CPI.

The second point to note in the relation between the Kisan Sabha and the Congress is that one year before the Lucknow session, the Government of India Act of 1935, which provided for provincial autonomy and elections to provincial legislatures, had come into force. Elections were to take place to provincial legislatures. Both the Congress and the CPI wanted to enlist the support of a broad section of peasants. With this end in view, resolutions were framed by both the Congress and the left-dominated Kisan Sabha. The Congress resolutions spoke of reducing the burden of taxation on peasants, of fair rents payable by tenants, of moneylenders/landlords not charging exorbitant interest rates, of reduction of the debt burden on peasants, and so forth. Similarly, the Kisan Sabha resolutions at Lucknow called for fixation of interest rates on loans taken by peasants at six per cent; land revenues to be in proportion to the income from land; all indirect taxes on land to be abolished; ownership rights on land to be given to the tiller, etc. There were, of course, significant differences between the resolutions adopted by the Congress and the Kisan Sabha. The latter, for instance, came out explicitly in favour of abolition of zamindari while the Congress resolutions sidetracked this issue. Likewise, the Kisan Sabha was very categorical (this is clear from the resolutions) on giving ownership rights over land to the tiller. However, in spite of these significant differences, the fact remains that for political reasons and with an eye on the coming elections, both the Congress and the Kisan Sabha framed their resolutions in such a way that they could appeal to poor peasants, middle peasants, tenants, etc. It is significant that while the major resolutions of the Kisan Sabha speak of reducing the tax debt burden on peasants, land to the tiller, etc, the minor resolutions speak of provision of irrigation facilities, fair price for sugarcane and commercial crops (this was aimed at attracting middle peasants and other peasant classes who cultivated commercial crops) and imposition of death duty and inheritance tax on landlords and merchants. As Sunil Sen, who was himself active in the Bengal Kisan Sabha, has remarked, "at Lucknow the emphasis was on immediate demands which could be realised so that it could appeal to the broad masses of peasants".[4] So far as the left-dominated Kisan Sabha is concerned, it is clear that from the beginning there were two pulls. One was the ideological pull which made the Kisan Sabha resolve to fight for poor peasants, landless and small landowning tenants, agricultural labourers, etc. On the other hand, there was the political pull which stemmed from the CPI's political rivalry with the Congress and a desire to beat the Congress in the political game by having as broad a base as possible in rural areas. Thus the Kisan Sabha did not wish to close its doors on middle peasants. In fact, the Bihar Kisan Sabha leader, Swami Shajanand Saraswati expressed his concern about the large number of middle peasants who had joined the Kisan Sabha in that state.[5] In Gujarat, it does seem from the available evidence that upto 1946, the bulk of the Kisan Sabha's membership was from poor peasants and agricultural labourers in the districts of Broach, Surat, Kheda and Baroda. The Gujarat Kisan Sabha also had a following among the Bhil tribals of Panch Mahals and the Dhodias of Valsad before 1946. After 1946, following large-scale evictions of tenants in the wake of land reforms, evicted tenants came into the Kisan Sabha in large numbers. This remained the position till 1956. It is difficult to say how many middle peasants became members of the Gujarat Kisan Sabha. We do not have a break up which will give us some idea of the peasant membership of the Gujarat Kisan Sabha according to the size of their landholdings. It is however clear that, in Gujarat and in other states where the Kisan Sabha tried to organise the peasantry, lack of clarity about the target group who should be organised among a heterogeneous mass of peasants as well the political pull which made the Kisan Sabha pass resolutions with a broad-based appeal, created problems for it from the very beginning.

With this background, the issues raised by the Gujarat Kisan Sabha in its struggles on behalf of peasants and other groups such as agricultural labourers it tried to organise or rather failed to organise effectively become more intelligible. We may now turn to the struggles launched by the Gujarat Kisan Sabha.

### STRUGGLES LAUNCHED BY GUJARAT KISAN SABHA

As stated earlier, two broad phases can be discerned. One was before 1946 when the major issues taken up by Gujarat Kisan Sabha on behalf of peasants were lowering of rents paid by tenants, reduction of land revenue, giving ownership rights on land to the tiller of the soil and giving minimum wages to agricultural labourers. On behalf of the Halpatis in South Gujarat, who were agricultural labourers permanently attached to their masters as bonded servants, the Kisan Sabha also put forward the demand that the Halpatis should not be treated as bonded slaves but as human beings. After 1946, the demands on behalf of agricultural labourers recede into the background, and tenants and peasants, mostly small landowning tenants with upto five to seven acres who were evicted in the wake of land reform legislation, came to dominate the Gujarat Kisan Sabha. The 1956 Tillers Day Act, which benefited a sizeable number of tenants considerably weakened the Gujarat Kisan Sabha. Following the 1956 Tillers Day Act, the tenants who got land left the Kisan Sabha. Communist ideology and talk of land redistribution did not appeal to them.

For reasons of space only some of the struggles launched by the Gujarat Kisan Sabha will be described. The Kisan Sabha leaders tried to focus attention on various issues concerning peasants by holding meetings at different places, taking out processions, courting arrest and by submitting representations or petitions to the authorities.

In February 1938, the Congress was holding its session at Haripura. The Kisan Sabha decided to organise a procession to the venue of the Congress session. Swami Shajanand Saraswati agreed to come from Bihar for the march. The programme relating to the march was printed and distributed. As February 18 (1938), the day the march to the venue of the Congress session drew near, the Kisan Sabha's leaders heard that Section 144 had been proclaimed at Vithalnagar, the venue of the session. Enquiries were made from the Congress office but there was no confirmation regarding imposition of Section 144.[6]

On the day of the procession, some 10,000 to 12,000 kisans and Halpatis, mainly from Bardoli, Mandvi, Mangrol and Songad Vyara, assembled. They carried the red flag and shouted that "the practice of taking half share rent be abolished and Halipratha [system of bonded agricultural labour] should be abolished".[7] Till the processionists reached Vithalnagar no one stopped them. When news of the march reached the Congress leaders, Sardar Patel made an angry speech and criticised the Kisan Sabha at the Congress general body meeting. But the President of the Haripura session, Subhas Bose, said that the Kisan Sabha had become well established in the country and could not be disturbed. Indulal Yagnik, Swami Shajanand Saraswati and N G Ranga spoke to the assembled Kisans and Halpatis. Swami Shajanand said that the Kisans supplied "food, milk and ghee and their grievances must be redressed".[8]

In April 1938, the Thakore landlords of Mansa in Mehsana district raised the rent to be paid by tenants by 200 per cent. The tenants organised by Kisan Sabha protested against this increase. The tenants' crops were seized by the landlords. There was a fight and subsequently police firing. The secretary of the Gujarat Kisan Sabha was arrested. Against his arrest and police firing, a big meeting was held at Mansa. The Kisan Sabha leaders spoke at the meeting against increase in rents and police firing. It was decided to observe April 3, 1938 as Akhil Hind Mansa day.[9]

In the years 1938-39, the members of the Gujarat Kisan Committee which included Dinkar Mehta, Kamlashankar Pandya, Harilal Shah, Chotubhai Shukla and Ramachandra Kaushik, worked among the kisans of Mangrol and Mandvi talukas. Pangarkar held meetings and spoke to the kisans and halis.[10] Through Pangarkar's efforts an agreement was reached with the landlords of Mangrol taluka. According to the agreement (1) old tenants who paid rent as per old government rules should pay rent as per those rules; (2) tenants not effected by the old rules should pay rent as in previous year and should not be asked to pay more rent; (3) those tenants and landlords who wanted changes in the rent agreement should be bound by governments decision on rent to be paid; (4) till the government takes a decision, landlords should not evict the tenants from his land; and (5) the practice of bonded labour, that is, Halipratha, should be recognised as slavery. Landowners who wanted servants should enter into a contract with the servants. They should not force the Halpatis to work permanently for them.[11]

Significantly there is no reference in this agreement with the landlords on giving minimum wages to the Halpatis. The Kisan Sabha leaders when asked about this maintain that Kisan Sabha compaigned for doing away with Halipratha or the system of bonded agricultural labour and when bonded agricultural labour is done away with, minimum wages to Halis would be taken care of. In fact, in Gujarat and elsewhere in the country (Uttar Pradesh, Haryana, etc) where the Kisan Sabha tried to organise both the small peasants and agricultural labourers, demands for minimum wages on behalf of the agricultural labourers gave rise to problems. This demand was not well received by the other section of the Kisan Sabha's following, namely, the small peasants.[12]

From 1940 till 1946 the Kisan Sabha held a series of meetings in Baroda district (Sankheda, Mevas, Tilakwada, Padra, Dabhoi), Surat district (Mandvi, Mangrol, Songadh Vyara, Olpad talukas), Broach district (Hansot, Jagadia, Rajpipla, Valia talukas) and Mehsana district (Kalol taluka). The issue raised at these meetings were more or less similar. They included giving ownership rights to the tiller, reduction of half share or *sathbhag* rent charged from tenants by landowners, abolition of debts, etc. However, after 1946, the meetings arranged by the Kisan Sabha increasingly sought to focus attention on the large scale evictions of tenants. A few instances of these meetings may be given. In June 1951, a big meeting was held at Chameda village (Baroda district). The Tenancy Act of the Bombay government had led to large-scale evictions of tenants from the land they cultivated. In 12 villages land which "belonged to poor tenants had been seized by the Thakore landlords". The Kisan Sabha leaders asked the evicted tenants who had come for the meeting to occupy the land which belonged to them and be prepared to go to jail and face other consequences. The evicted tenants did as they were told. They occupied and started cultivating the land from which they had been evicted. The landlords called the police who came and arrested the tenants and beat them up. However, in spite of the police action, some of the tenants did not leave the land they had started cultivating.

Around this time (1951) a Kisan Sabha meeting was held at Kasadgam (Kheda district). It was attended by several thousand tenants. The Kisan Sabha leaders spoke to those assembled. They said that the tenancy rules passed by government were put to wrong use. The cultivators were evicted. They asked the tenants not to leave or surrender even a bit of their land out of fear. The tenants were also asked not pay more than ¼ of the produce as rent. Resolutions were passed after the meeting.[13]

The sixth and biggest conference (in terms of attendance) of the Gujarat Kisan Sabha was held at Vankal in Surat district in April 1953. The open session of the Vankal conference was attended by about 22,000 peasants. According to Kisan Sabha sources, the Vankal conference was the 'high point' of Gujarat Kisan Sabha. At this time (1953) the Gujarat Kisan Sabha had 21,000 members. The previous available figure of Kisan Sabha members for Gujarat is 7,000 in 1939.[14] (After the Vankal conference, attendance at meetings and membership declined, and the Kisan Sabha became dormant in 1956.)

Before the open session of the Vankal conference the Gujarat Kisan Committee met at Vankal. The land and tenancy question was discussed at length.[15] The Committee members observed that "on the one hand government was saying that land belongs to the tiller but at the same time implementing that policy had led to eviction of thousands of tenants who became agricultural labourers". But there was concealed tenancy. The so-called agricultural labourer who tilled the land had to pay half share rent to the landlord. To circumvent the rules he was no longer called tenant but he had to give half share rent to the landlord. The Kisan Committee expressed its dissatisfaction with this state of affairs.

The Kisan Committee resolved that in areas where the practice of paying 1/5 or 1/6 portion of the produce had come into vogue, in those areas, the local standing Committee of the Kisan Sabha should enter into an agreement with the landlords on behalf of the tenants on the portion of the produce to be paid as rent. The Kisan Committee also resolved that for implementing the tenancy rules relating to land to the tiller, the existing tenancy rules should be suitably amended by government and a commission should be appointed for this purpose. Finally, the Committee resolved that when the demand for Maha Gujarat conceded, then Adivasis (tribals) would be given a fair deal including their social and economic uplift. In the meantime, the Adivasis should get reasonable wages from forest labour co-operatives, bamboo and other materials should be supplied to them for building houses and they should be given free land.[16]

This review of the meetings of Gujarat Kisan Sabha and the issues raised shows that the problems of tenants, their eviction and high rents paid by them to landlords figure prominently. This was to be expected for two reasons. First, landlords charged high rents from tenants which was generally half share of the crop. Moreover, successive land reform legislation led to evictions of tenants. The evicted tenants turned to the Kisan Sabha for support and joined it in sizeable numbers. Second, the Kisan Sabha was the peasant wing of a political party which was ideologically committed to fighting against oppression by landlords of tenants. Through its meetings the Kisan Sabha sought to focus attention on what it considered the burning issues concerning tenants.

## ROLE OF GUJARAT KISAN SABHA

We may first deal with the question why the Gujarat Kisan Sabha became dormant following the tenancy legislation of 1956. Fortunately for Gujarat, we have studies which seek to evaluate the impact of the 1956 Tillers Day Act. The studies by M L Dantwala and C H Shah on "Evaluation of Land Reforms" and M B Desai on "Tenancy Abolition and Emerging Pattern in Gujarat" show that sizeable number of tenants in Gujarat, especially landless and poor tenants, benefited as a result of the 1956 legislation. Dantwala and Shah's study covers selected talukas in Maharashtra and Gujarat. We will examine the data only for Gujarat. The study is at two points of time 1956-57, the year of the promulgation of the Tenancy Act, and 1964-65. It gives specific information on movement up and down the agrarian ladder in Nadiad and Matar talukas in Kheda district of central Gujarat. This information is presented in Table.

The Table shows that in both talukas, the biggest gainers of the 1956 Tenancy Act were the landless tenants who arrived in the small farm category from below. The next group of sizeable gainers were the small farmers who moved to the medium farmer group. Both the landless and small tenants constituted the bulk of Gujarat Kisan Sabha's membership.

M B Desai's study of the impact of the 1956 Tenancy Act is for the period 1957 to 1964 and it covers nearly all districts in Gujarat. It shows that out of 8,90,758 tenancy cases disposed of by the land tribunals, tenants purchased ownership rights in 3,95,111 cases, that is in 44.35 per cent cases ownership rights were acquired by tenants.[17] P S Appu in his paper on "Tenancy Reform" shows that as a result of the 1956 Tenancy Act, ownership rights in Gujarat had been purchased by 7.73 lakh tenants out of 12.94 lakh tenants (more than half the total number).[18]

The implementation of land reforms has been tardy from the very beginning. Though successive land reform legislation (of 1946 and 1948) tried to improve on the previous legislation, there were always some loopholes which led to evasions and evictions. The 1956 Tenancy Act made the tiller owner of land and did not recognise new tenancies on a permanent basis. But there was provision for landowners to enter into annual tenancies. The landowners must have taken advantage of this provision. However, in spite of this, as these studies show, a sizeable number of tenants gained in Gujarat and became owners.

The question that needs to be raised here is that if the Kisan Sabha helped the tenants why did they leave it? The landless who gained land and the small peasants who got more land developed a vested interest in land ownership. The ideology of the communist-dominated Kisan Sabha which spoke of land redistribution did not appeal to them. The same thing happened in Kerala and Tamil Nadu, as K C Alexander's studies show. Tenant dominated peasant organisations in those states led by CPI in Tamil Nadu and CPI(M) in Kerala became dormant following land reforms which gave ownership rights to tenants.[19] Thus the 1956 Tillers Day Act was an important factor which contributed to the dormancy of the Gujarat Kisan Sabha.

From pre-Independence days, the Indian National Congress was committed to reducing agrarian inequalities through land reforms. After independence, a series of land reform measures were enacted. There was also consistent pressure from the left-led peasant organisation like Kisan Sabha for land reforms. As Alice Thorner has remarked in her paper, "the land reforms represented a response to the demands voiced by vigorous peasant movements which were active in many regions of the country at that time; we need only for reference Telengana, Tan-

jore, North Bengal, the Punjab and Uttar Pradesh. As the bills made their way through the state legislatures, the members were conscious of pressures from proponents and opponents of practically every caluse; their decisions were taken in the midst of widespread public discussion and loud clashes of opinion".[20]

By and large, land reforms could not achieve their objective of reducing the inequalities and inequities in the agrarian social system. This was because of factors inherent in the agrarian system and also loopholes in the land reform legislation which enabled powerful groups in the countryside to protect their interest in land. It is, however, acknowledged that of the several land reform measures enacted since Independence one measure that has had a fair degree of success in some states was that for giving tenants ownership right on land they cultivated through the Tillers' Day Act which made tillers owners of land by purchasing ownership rights of the land they tilled.[21]

Finally, we may discuss the role of Kisan Sabha and organisation of agricultural labourers. For ideological and political reasons the Kisan Sabha tried to organise the small peasants who constituted the largest group among the peasantry and agricultural labourers. Organising both these groups at the same time gave rise to certain dilemmas for the Kisan Sabha. Thus pressing for higher wages for agricultural labourers, especially landless labourers, hurt the small peasants most. The small peasants who own, say, five to seven acres of land employ agricultural labourers if the need arises. When free they themselves work either on exchange basis or for wages on others' farms. However, the fact remains that they did not like it when the demand for minimum or higher wages was pressed on behalf of landless agricultural workers. When faced with these dilemmas, the Kisan Sabha, rather than lose the support of the more numerous small peasants, did not press vigorously the demands of the landless agricultural labourers.

From the thirties, the communists have been organising the peasants through their Kisan Sabhas and forming organisations specifically for agricultural labourers in several parts of the country. However, only in some parts of the country such as Thanjavur in Tamil Nadu, Kerala and West Bengal have they succeeded in building up effective organisations of agricultural labourers. Agricultural labourers' unions in these states have put forward and won demands for higher wages, fixed hours of work and other benefits, while in other parts of the country, including Gujarat, in spite of their efforts, the communists have not succeeded in building up effective organisations of agricultural labourers. The reasons, as mentioned earlier, seem to be the heterogeneous character of the agricultural labour population in terms of caste and class. Divergent interests of small farmers and landless agricultural labourers plus the fact that they belong to different caste groups appear to hinder the growth of effective organisations of agricultural labourers in many parts of the country.

In areas like Thanjavur (Tamil Nadu) and Alleppey (Kerala) the presence of a large population of agricultural labourers, almost all of them belonging to scheduled castes, and also the fact that one of the areas (Kerala) has had long spells of communist rule, would seem to be favourable factors for growth of effective organisations of agricultural labourers.[22] The data indicate that barely three per cent of agricultural labourers in the country are organised in the form of effective unions.[23]

## CONCLUSION

In the late thirties (1938-39), the demands put forward by Gujarat Kisan Sabha were on behalf of tenants, agricultural labourers and bonded agricultural labourers (the Halpatis). However, after 1946 there was a shift. The problems of tenants who were harassed by high rents and also by evictions in the wake of land reforms come to dominate Gujarat Kisan Sabha.

If we examine the role and activities of the Gujarat Kisan Sabha not as an isolated case of a provincial unit of a larger all-India organisation, but in a broader perspective of the efforts of the communists to organise the peasantry and agricultural labourers since the thirties, it would appear that the Gujarat unit of the All India Kisan Sabha was a rather weak link in the chain of peasant movements and 'struggles' organised by communists in various parts of the country. This is because the left has generally been weak in Gujarat. Even in 1953 at the time of the Vankal conference when the Kisan Sabha's movement in Gujarat was at its peak, the Gujarat Kisan Sabha's following was insignificant compared to its following in areas like Bengal where the Kisan Sabha organised the Tebhaga Movement or Andhra where the communists organised the Telengana struggle.

From the beginning, that is from the thirties, a number of strands, political, ideological and what may be called the desire to take up burning issues such as evictions of tenants characterised the functioning of Gujarat Kisan Sabha.

The fact that the Kisan Sabha took up the cause of the tenants who for their own interest sought the Kisan Sabha's support only weakened the Kisan Sabha in the long run. Thus tenant dominated organisations of Kisan Sabha become dormant in states like Gujarat, Kerala and Tamil Nadu. Once the tenants obtained ownership rights they lost interest in the Kisan Sabha and saw in the very organisation which had supported them a threat to their interest.

ANOTHER EXPORT AWARD

# Hoechst wins coveted TRISHUL TROPHY!

Hoechst India Limited has won the coveted Trishul Trophy of the Basic Chemicals, Pharmaceuticals and Cosmetics Export Promotion Council, Bombay, for its excellent Export performance for 1983-84.

Hoechst exports took a big leap to touch the figure of Rs. 15 crores, a growth of 45% over 1982/1983.

The volume of exports is significant as it forms 10% of the Drugs and Pharmaceuticals exports at the All India level. With regard to Finished Formulations, Hoechst's share was as highas 30%.

Hoechst exports to U.S.S.R. and to Nigeria, Kenya, Monrovia, Sri Lanka and U.S.A. The export assortment includes Finished Formulations for Human as well as for Veterinary use.

Hoechst has established a production unit in the Kandla Free Trade Zone which commenced production in 1983.

Today, it is manufacturing two important formulations which account for half of total exports.

Hoechst will continue to intensify its export efforts since it believes that it is a valuable foreign exchange earner for the country.

At the dawn of the new age of electronics, it is time for India to awake from her slumber. And the Prince Charming of computers, Tata Burroughs Limited, will lead her hand in hand, to her glorious future.

Suitors from distant lands have tried to break the spell, but the perfect match is one from home, the fearless TBL.

Young TBL

- whose wealth of expertise will bring the very latest computer technology to precious single users and large corporate establishments
- whose golden heritage will bring the experience of a hundred years from Burroughs Corporation, U.S.A.
- whose capabilities already drive India's steel, automobile and other key industries and will soon expedite Banking operations
- whose fame has spread far and wide with 300 successful software projects in 22 countries, for clients like Yamaha, Citibank, Ford and Swissair

Indeed, TBL is here to establish the new age and reign happily ever after.

# Right to Life, but . . .

A FIVE-MEMBER constitution bench of the Supreme Court delivered its long-awaited judgment in the Bombay pavement dwellers case on July 10. In what has been described as a 'landmark judgment', the Court has held that pavement and slum dwellers have no right to encroach on footpaths, pavements or any other place earmarked for a public purpose, such as a garden or a playground, and that they can legally be evicted under Section 314 of the Bombay Municipal Corporation Act. The judgment has evoked the expected responses from different quarters. The Municipal Commissioner of Bombay has welcomed it; the city's Mayor has exhorted the civic administration and the state government to take expeditious steps to remove encroachments after the expiry of the time-limit of October 31 stipulated by the Supreme Court; the Commissioner of Police is happy that there will be free movement of pedestrian traffic now with the removal of pavement encroachments; the Shiv Sena has viewed the judgment as a vindication of its campaign to stop the flow of 'outsiders' into Bombay.

For a lay reader of the Supreme Court's judgment, however, it is difficult not to be puzzled by some aspects of it. What is especially striking is the position taken by the Court on the principal argument put forward on behalf of the slum and pavement dwellers, the petitioners before the Court—that the right to life which is guaranteed by Article 21 of the Constitution includes the right to livelihood and since slum dwellers and pavement dwellers will be deprived of their livelihood if they are evicted from their slum and pavement dwellings, their eviction is tantamount to deprivation of their right to life. Two questions are involved here: first, whether the right to life includes the right to livelihood; and, second, whether in the specific case of slum and pavement dwellers, they will be deprived of their livelihood if they are evicted from their dwellings.

On the first question, the position taken by the constitution bench is categorical—that the right to life indeed includes the right to livelihood. The judges observe: "That which makes it possible to live, leave aside what makes life livable, must be deemed to be an integral component of the right to life." Further, "If the right to livelihood is not treated as a part of the constitutional right to life, the easiest way of depriving a person of his right to life would be to deprive him of his means of livelihood . . .". The judges then turn to the factual question of how far it is true that slum and pavement dwellers will be deprived of their means of livelihood if they are evicted from their slum and pavement dwellings. Here again their verdict is unambiguous. They say: "persons in the position of the petitioners live in slums and on pavements because they have small jobs to nurse in the city and there is nowhere else to live. Evidently, they choose a pavement or a slum in the vicinity of their place of work, the time otherwise taken in commuting and its cost being forbidding for their slender means. To lose the pavement or the slum is to lose the job. The conclusion, therefore, in terms of the constitutional phraseology is that the eviction of the petitioners will lead to deprivation of their livelihood and consequently to the deprivation of their life."

However, despite accepting that the right to life conferred by Article 21 of the Constitution includes the right to livelihood and despite acknowledging that it had been established to their satisfaction that if slum and pavement dwellers are evicted from their dwellings they will indeed be deprived of their livelihood, the judges proceed to sanction precisely such eviction on the ground that Section 314 of the Bombay Municipal Corporation Act which provides for removal of encroachments on footpaths or pavements "cannot be regarded as unreasonable, unfair or unjust". It is held that the existence of dwellings on pavements "is unquestionably a source of nuisance to the public" and further that the putting up of a dwelling on a pavement "is an act of trespass"—though it is clarified that while slum and pavement dwellers are using pavements and other public properties for an unauthorised purpose, "their intention or object in doing so is not to 'commit an offence or intimidate, insult or annoy any person' which is the gist of the offence of 'criminal trespass' under Section 441 of the Penal Code".

Judicial pronouncements are, of course, full of legal fine points and subtleties which those untrained in the legal method are very liable to miss, but a lay person may be forgiven if he draws the conclusion from the Supreme Court's judgment in the slum and pavement dwellers case that the Court has weighed in the balance slum and pavement dwellers' right to life and the pedestrians' right to use pavements, a Fundamental Right written into the Constitution and (as the judges themselves agree) reinforced by the Directive Principles of State Policy and the power granted to the Bombay Municipal Corporation under an Act passed in 1888 and has found it fit to uphold the pedestrians' right and the Municipal Corporation's power. It is difficult to avoid a sense of puzzlement over this position of the highest court in the land. Is the answer to the puzzle to be sought in the combination of a rather easy espousal of social justice and the cause of the poor at the level of rhetoric and a cold-eyed endorsement of the diktats of a class society when it comes to brass tacks?

## *Politics*

### Self-Deception on Emergency

REACTIONS to Rajiv Gandhi's *faux pas* on Emergency cover a very wide range of judgments. While his party colleagues have expectedly either extended staunch support to his pronouncements or tried to explain them away with an air of mild embarrassment, the response of non-Congress(I) commentators has also been varied. Some of them have tried to play the whole thing down as a casual riposte to an unexpected provocation, while some others have branded them as an unabashed declaration of a sinister intention. Overall, the hullabaloo raised by the Prime Minister's statements on the subject of Emergency—past and future—is an unflattering commentary on the naivete of Indian political circles.

First of all, it reveals an all too innocent faith in the late Prime Minister's repentance about the 1975 Emergency and her promise not to be so naughty in future, although even her most ardent admirer would hesitate to swear that Indira Gandhi was strictly wedded to 'the truth, the whole truth and nothing but the truth'. It is hardly a correct understanding of *real politik* to take the profession of even a most truthful politician at its face value.

Secondly, the current uproar also reveals the tragic lack of the awareness that, irrespective of all promises and professions, a creeping Emergency has already overtaken the country. Witness the enactment and operation of various extraordinary laws, stretching from the NSA to the Terrorist and Disruptive Activities (Prevention) Act in varius parts of the country. Under the present dispensation, not only many ordinary men and women are illegally liquidated by the police with impunity, even when a Raja in Rajasthan or a tribal ex-MP with close ties with the ruling party falls victim to the trigger-happy policemen, the wheels of the legal process are not seen to be moving with any alacrity.

Of course, one cannot ignore the one redeeming feature of the current situation—the absence of nationwide censorship that accompanied the 1975 Emergency. But the way a total blackout was imposed on the Punjab press and pressmen during and following the so-called Operation Bluestar and the way a particular journalist is being persecuted for his effective exposure of the Punjab events are tell-tale indicators of the ferocity of powers enjoyed by the existing regime in the sphere of news 'management'—that is, of course, excluding the 'self-imposed', 'responsible' restraints practised by the big papers.

Although there was nothing to inhibit Rajiv Gandhi from repeating his late mother's honeyed phrases about Emergency and although he has indeed created problems for his image-builders by blurting out his real opinions, most of the commentators on the subject have tended to obfuscate the issues by making superficial observations. Most particularly misleading are the attempts to underestimate the critical dimensions of the present situation by focusing on 'the mood of optimism and hope' in the country. Then, also, the emphasis on Rajiv Gandhi's personality as a deterrent factor against Emergency type of rule is not strictly relevant, even if it were true really. If the attempt to explain the 1975 Emergency at least partly, by reference to "the decomposition of the Nehruvian system of consensual politics and economic difficulties" be correct, then to reassure oneself by saying that "India in 1985 is very different from the India in 1975" is largely a self-deception.

There is little hard evidence so far to conclude that Rajiv Gandhi is personally allergic to anti-democratic norms and forms. More importantly, grave turns in politics are not determined solely or even mainly by the personality of individuals in high places. Situations mould or lead to changes of persons in power. The only difference between now and 1975 is that the Indian people may not be caught napping again—provided of course they do not allow the creeping Emergency creep much further.

## *Assam*

### 'Restoration of Democracy'

A CURIOUS feature of the announcement revoking the notifications under the Assam Disturbed Area Act of 1955 and the Armed Forces Special Powers Act of 1958 (as amended by the Armed Forces Assam and Manipur Special Powers Amendment Act of 1972) which was made in the Assam Assembly on July 18 is the rather transparent evasion about the circumstances in which notifications under these two Acts were originally issued. The official statement revoking the notifications suggests that the two Acts were initially invoked because of the "agonising times" that the state had to pass through due to the "protracted agitation over the issue of foreign nationals". The statement then reassuringly notes that "the restoration of democratic life in the state through the general elections in 1983 and the installation of a popular government however ushered in new hope for the creative and well meaning forces which started gradually asserting themselves under the leadership of the democratic government.

The fact is that the notifications in question were issued by the 'democratic government' that came into existence after the bloody and controversial elections of 1983. One of the first actions of that 'democratic government' was to declare, in stages, the whole area of the Brahmaputra valley as 'disturbed'. The 'popular ministry' assumed office on February 27, 1983; and on March 3, the first of the notifications covering, initially, fifty-five of the (then) 107 thanas in the Brahmaputra valley was issued, to be followed by further notifications on March 16, March 21 and April 10 by when the whole of the Brahmaputra valley came to be declared a 'disturbed area'. It is true that on an earlier occasion, at the height of the agitation when the supporters of the agitation had perpetrated unspeakable atrocities on linguistic and religious minorities in north Kamrup in early 1980, the whole state had been declared disturbed; but that notification was not renewed and the army which had been called in to restore law and order soon withdrew. But the notifications issued in the wake of the installation of the 'popular government' were periodically renewed. The chief minister has now merely announced his government's decision not to go in for fresh notifications. The law itself, of course, stands.

To suggest that the "restoration of democratic life in the state through the general elections in 1983" was in some ways a prelude, and a fairly extended prelude at that lasting over two years, for the eventual revocation of the notifications under the two Acts is thus not merely to be evasive about the origins of the notifications but also about the nature of the 'democratic life' and its restoration that the elections of 1983 brought about.

## *Tourism*

### Over to R and R

THE planned shift of thrust from 'culture tourism' to 'leisure tourism' (whatever these two terms might mean) that the Centre is reported to be planning to further encourage domestic tourism and attract more foreign tourists to India is quite in tune with the broader strategy of taking this country—which is increasingly being treated as synonymous with the dominant and affluent sections of its population—into the twenty-first century so assiduously being promoted by the Prime Minister. The plans revealed during the conference of secretaries to the departments of tourism in the state governments and the managing directors of the state tourism development corporations in Delhi on July 15 envisage vigorous promotion of domestic tourism as well diversification of overseas tourism. The diversification, apparently, would be away from the "traditional sightseeing tours centred primarily on places of cultural tourist interest and towards the rapidly growing holiday tourism market".

This is of a piece with the feverish efforts, at home and abroad, to 'sell' India—at any price. Indeed, the splurge of spending on the hotel industry and allied infrastructural services, which considerably predates the building of the vast facilities in Delhi and Goa in connection with the Asian Games and the CHOGM conference, clearly foresaw the shape of things to come. Increasingly official policy takes it as axiomatic almost that only a small segment of the Indian population can be involved in *consumption* (though the vast majority may be engaged in *production*). Far from doing anything to correct the imbalance, government takes such imbalance as a necessary aspect of the developing class relations which alone, it is assumed, will modernise the economy and propel the country into the twenty-first century. The task of the government is seen as being to push things along on these lines as rapidly as it can.

The country is thus speedily moving towards becoming a centre for rest and recreation of every kind of jaded appetite, foreign as well as domestic. The enormous increase in 'domestic tourism' has little to do with the desire, let alone the ability, of the masses of our people, or even of the middle classes, to travel into other parts of the country to experience the rich diversity of Indian life and culture; the boom is almost entirely related to the proliferation of expense accounts and the stupendous increase in conspicuous consumption financed out of black money.

This is now being sought to be camouflaged and rationalised by the development of overseas tourism. With the proposed diversification programmes envisaging, among other things, development of 'beach resorts and incentive holiday packages' one can foresee a situation where soon Indian beach resorts, fully developed beyond the reach of locals except those supported by the public exchequer or by industry and business, will be competing with places like Pattaya in Thailand—and naturally will be catering to a corresponding clientele. As many as 26 chartered flights have already been booked, we are proudly informed, to carry West German tourists (whose favoured resorts, as those of so many other Europeans and Americans, continue to be in South East Asia) directly into Goa and out between October this year and April next, the peak holiday season.

## *Oil*

## Widening Cracks

THE world oil scene has become hazy as the market situation reflects highly unreliable and uncertain trends. Over a year ago predictions were made by some so-called oil experts that oil prices would fall to about $ 20 per barrel. If this prediction had come true, oil prices should have fallen to that low level in the latter half of 1984. But almost a year has passed and oil prices continue to hold around $ 28 per barrel, though there are widespread reports that discounts are being offered by some exporters. At the current dollar exchange rate, the price of oil is almost equal to the earlier price of $ 34 per barrel that prevailed a couple of years ago.

More recent guesswork that oil price would decline has again not proved to be correct. It is true that the OPEC is a much less coherent and united force today than it was upto mid-1981. But it has not yet reached breaking-point despite the prolonged Iran-Iraq war that has deeply divided the West Asian OPEC countries. All the countries appear to realise that despite their deep differences they should not do anything that upsets the apple-cart of oil price too violently.

The basic trends influencing the oil export market have turned out to be continuously adverse since the latter part of 1981. World oil consumption is declining at an annual rate of about seven per cent. The short-lived recovery in oil demand that took place in mid-1983 could not be sustained. The trend in world oil prices cannot, however, be explained merely in terms of falling consumption. There have been basic structural changes influencing the world oil economy. With the growing weakness of oil companion and declining control over the oil supplies, the oil market got fragmented so to say among national suppliers. This also resulted in the growing importance of the spot market as the more enterprising governments deemed it to be advantageous to sell larger quantities through the uncontrolled spot market. It should be noted that the spurt in oil price during 1978-81 was triggered by relatively short-lived supply interruptions, as many countries thought it safer to build up inventories. This boosted demand over and above current consumption needs which were declined at a more rapid rate during 1978-81 than during the subsequent period when the oil price got stuck at a much higher level.

The structural changes in oil economy cannot be explained fully unless we take into account the growing oil production in non-OPEC countries. While total world oil production declined by nine per cent during 1978-84, production in non-OPEC countries increased by 20 per cent. As a result, the combined export volume of OPEC fell by about 50 per cent and its share in world oil production declined to about one-third. In an attempt to maintain oil prices at a high level OPEC countries had to continually reduce their export volumes voluntarily in a mutually agreed fashion. Although there have been accusations of violation of discipline, all OPEC members are aware of the high stakes involved and are therefore not crossing the line.

Although it would be difficult to predict the course of oil prices, which largely depend on volatile West Asian politics, certain developments need to be noted. The demand for oil may not decline further as the tendency to draw down stocks is said to be abating. The stocks of oil which were equivalent of about 85 days' consumption in 1983 had declined to 73 days' by the early part of 1985. It is felt that bringing down stocks to further lower levels would not be favoured by the developed countries for strategic/defence reasons. Since the world economy has almost got accustomed to the current price levels, for some time there may not be the same drive to pursue energy-saving measures.

On the supply side, however, the situation is fluid. The combined current account deficit of major oil exporting countries has declined from $ 18 billion in 1983 to $ 6 billion in 1984 and is likely to remain steady around this level. Pressures for increasing exports of oil by any particular country would not, therefore, be unduly severe. On the other hand, Iraq is reported to be improving its export capacity which is expected to materialise by end-1986. Saudi Arabia is also reported to be under American pressure to disturb the apple-cart. Recent Saudi utterances to that effect may destabilise the market. The current Saudi exports which are around three million barrels a day can be easily stepped up to nine million barrels per day in no time. If the Americans really decide to push down oil prices to give a boost to their slackening economic recovery, Saudi Arabia may find it difficult to resist the pressure.

# Ministerial Cotton-Picking

**THE** Union Minister for Agriculture and Rural Development, Buta Singh, is reported to have made a fervent plea for evolving a national strategy to raise the overall production of cotton from the present level of 77-78 lakh bales to 95 lakh bales by the end of the Seventh Plan. The occasion was the national level meeting on cotton production held in New Delhi on July 15. The meeting was attended by the state agricultural secretaries, agricultural production commissioners, vice-chancellors of agricultural universities, managing directors of state seeds corporations and agricultural scientists. The minister laid special emphasis on production of medium and long staple cottons. He pointed out that it would help narrow down the varietal imabalance if 30 to 40 per cent of the cotton area is covered by certified seeds in the northern states—major producers of short-medium staple cottons—and 15 to 30 per cent in other states.

Unless it is a case of gross misreporting, Buta Singh's inaugural speech betrays complete ignorance about the current state of the cotton economy. Cotton production is sought to be raised to 95 lakh bales (170 kg each) by 1989-90 from the present level of 77-78 lakh bales. It is pertinent to ask as to how the Minister for Agriculture has come to reckon the present level of production at 77-78 lakh bales. He has himself mentioned in his speech that cotton production during 1984-85 is expected to be as high as 85 lakh bales. This itself is a gross underestimate.

Is one to believe that the minister is unaware that the Cotton Advisory Board's standing committee representing industry, trade, CCI and the Ministry of Agriculture has placed the 1984-85 cotton crop at 92 lakh bales. This production level has been achieved without much extra effort. Going by the careful scrutiny of the ginning/pressing figures, knowledgeable persons in the trade reckon the crop at between 94 lakh and 97 lakh bales.

In the circumstances, there seems little sense in pleading for evolving a national strategy to raise production to 95 lakh bales by 1989-90. One can certainly argue that production cannot be said to have been stabilised at 95 lakh bales. But that alone cannot justify the fixing of the Seventh Plan target at a level that has already been achieved.

Buta Singh appears to be equally ill-informed about the variety-wise production of cotton. The production of long and extra long staple cottons is not 30 lakh bales as mentioned by him; it exceeds 45 lakh bales, the figure for 1984-85 being estimated at around 46/47 lakh bales. No less surprising is his clubbing of medium and long staple cotton together instead of medium with short staple cotton while talking about varietal imbalance. The question of varietal imbalance resulting from a major technological breakthrough in the production of long and extra long staple cotton on the one hand and virtual stagnation in the production of short-medium staple cottons on the other has been the subject of a lively debate in recent years. The new textile policy makes special mention about the need to rectify this imabalace.

Few will question the need to step up cotton production to meet the textile industry's groing raw material requirements as also to exploit the potential for export of long and extra long staple cotton. The various suggestions made by the agriculture minister in this connection—enhanced use of certified seeds, proper plant protection coverage and better economic practices—merit serious consideration by all those concerned with increasing production and productivity.

Buta Singh's inaugural speech is apparently based on crop estimates prepared by the Agriculture Ministry which have always lacked credibility. Indeed, if one were to go by the Agriculture Ministry's crop figures one would come to the absurd conclusion that the cotton textile industry has consumed over the years more cotton than what has been available—indigenous production and carryover stock plus imports minus extra factory consumption, exports and season-end stock.

It is indeed shocking that nobody should be in a position to vouch confidently for the size of the crop even though the current season has only about five weeks more to go. The Agriculture Minister would be well-advised to evolve a national strategy to strengthen and streamline the machinery for undertaking cotton crop forecasting which could be depended upon by the government for taking appropriate policy decisions. The *ad hoc* measures adopted this season in regard to export and import of cotton reflect poorly on the government's ability to assess the overall and variet-wise supply position of cotton and steer clear of pressures from the industry and farm lobbies. New Delhi's latest decision allowing import of one lakh bales of short and medium staple cotton and simultaneously releasing an equivalent quantity of long and extra long staple cotton has very little to do with the statistical position of these varieties. It is a very crude attempt at striking a balance between the apparently conflicting interests of the cotton mill industry and cotton growers.

The pronounced contra-seasonal weakness in the cotton market despite record mill consumption—averaging around 7 lakh bales a month—is convincing evidence of the comfortable supply position. Despite this being the fag-end of the season, the market has had to reckon with considerable pressure of arrivals. Most varieties of cotton are quoted at our very close to the season's lowest levels. The Cotton Corporation of India has had to purchase nearly 70,000 bales of long and extra long staple coton—mostly from the southern states—at support prices. This, of course, has turned out to be a highly profitable business because of the realisation of higher unit prices in exports.

The release of export quota of one lakh bales of long and extra long staple cotton (announced on July 10) has had no noticeable effect on the market. This is partly because of the ample supply of long and extra long staple cotton and partly because of the simultaneous announcement of import quota of one lakh bales of short-medium staple cotton. If the ruling prices are any indication of the supply position, the decision to import cotton is highly questionable. Imports will be channelised through CCI which will effect purchases on the basis of indents submitted by the mills and fully supported by letters of credit. Although Pakistani cotton is cheaper by Rs 200 to Rs 300 per candy mills are unlikely to show much keenness in availing of the opportunity. There is no shortage of short-medium staple cotton in the domestic market. CCI alone is carrying over one lakh bales of medium staple cotton. Prospects of any significant rise in cotton prices are generally rated low. The current season is expected to end with a fairly large carryover stock. On current indications—weather conditions and sowing reports—the outlook for the new cotton crop appears quite promising. Of course, it is much too early to make any meaningful guess about the 1985-86 crop.

## *Tea*

### Global Manipulation?

CURIOUSLY the steep downturn in the price of tea in the world market, over the past six months, seems to have drastically altered the publicly expressed perception of spokesmen of planters, traders and companies.

In 1983 and 1984 the price of the commodity, in both the domestic and international markets, kept soaring, and attained a new peak in the latter year. During those two years the spokesmen repeatedly stressed that the industry could hardly be blamed for the rise. Production of tea in India, thev stated, had stagnated during the early 1980s, allegedly because of the unremunerative returns received by planters. (A fear was even expressed that if the tea industry continued to be neglected then India, presently the single biggest exporter, might well be forced into becoming an importer in a decade or so.) While the quantum of harvest remained at about 560 mn kgs, domestic demand was estimated to have been going up by about 6 per cent per annum. This demand-supply gap, it was claimed, was largely responsible for the spurt in domestic prices in 1983 and 1984. The prices received by the industry in those years, it was added, were not at all high in a sense since the returns secured then barely covered the losses the planters, traders and companies had accumulated during 1980-83.

The growing domestic demand-supply gap, the spokesmen continued, partly led to a similar gap (and therefore price rise) in the international market, since India contributed half the quantum sold in the world market. The political turmoil in Sri Lanka, which affected the island state's essentially foreign tea trade, was said to be the other major factor behind the rise in the world price of the commodity.

It will be recalled that the Indian government took certain measures in an attempt to beat down the escalating domestic price of tea in 1984, an election year. Export of the cut, tear and curl variety—which is the leaf mostly consumed domestically—was banned and an upper ceiling of 215 million kgs was fixed for total exports; a minimum export price was stipulated to also ensure that the buoyant world price was not dampened, at least by Indian exporters. At best these measures had the effect of retarding the rate of growth of the price rise. In other words, the domestic price of tea kept going up though not at the earlier accelerating pace.

Now the international price has declined, tumbling from £ 2.80 per kg in January 1985 to £ 1.24 per kg last month. Spokesmen of the industry blame surplus production and poor world demand for this downswing. (Closer examination will reveal that such an explanation contradicts their earlier understanding of the factors behind the 1983 and 1984 price rise. Perhaps such contradictions are only to be expected since lobbies like those of planters, traders and companies would mostly propound half truths to rationalise their actions or make policy demands or shield themselves from blame.) However the real explanation apparently lies in the accumulation and manipulation of stocks by the handful of multinational corporations who control the global free market trade in the commodity; the involvement of domestic interests, particularly that of the subsidiaries of the corporations, in such global manipulation is an issue that is well worth probing.

The decline in the international price of tea, the United Planters Association of South India claims, has again pushed the industry into a crisis: traders and companies are said to be wary of making purchases. The Association has represented to the government that the restrictions on exports, introduced last year, be lifted. It is expected that with the removal of the restrictions the quantum sold abroad would go up forcing the companies and traders to step up their purchases at the auctioning centres.

The price at the domestic auction centres has moved down marginally by about five per cent in recent months, in a muted response to the world situation. Not very surprisingly, though the international price has tumbled and the domestic auction prices too has slid down, domestic consumers continue to pay last year's high price. Evidently UPASI and other such lobbies want the government to change the tea policy so as to maintain the current price levels. Their earlier arguments—of a demand-supply gap, of the spectre of tea imports—have been set aside and will probably be taken up again when the next big spurt in tea prices occurs.

## *Stock Market*

### Taking Too Much for Granted

COMPLETELY unmindful of the alarm signals flashed by the Union Finance Ministry and undaunted by the enforcement of rigorous margins and the high carry-forward charges in settlement after settlement, the stock market kept pushing its way throughout June. Precariously perched at its all-time high at the end of June, the market experienced its first nasty jolt on July 2 and 3 which was severe enough to induce considerable nervous bull liquidation resulting in one of the sharpest two-day decline in equity prices.

In view of the phenomenal upsurge in equity prices since the turn of the year, technical considerations alone could have produced the kind of sell-off that the market witnessed during the first two trading sessions in July. But market sentiment also appeared to have been unsettled by the UTI chief's observations on the state of the stock market as also by the massive raids by the income-tax authorities on the offices and residential premises of certain stockbrokers alleged to have been involved in 'benami' deals in shares and securities. The UTI chairman had expressed the view that the prices of some shares had reached "unreasonably high levels" and that the yield on several shares was as low as one to two per cent which was "unheard of in our country".

The overall behaviour of the market after the initial sinking spell in the beginning of the month gave one the impression that the market had taken the long overdue pause to allow technical forces to have their full play. The erratic behaviour of the south-west monsoon and the prolonged dry spell in several important agricultural tracts growing kharif crops also made for caution. With bullish fervour having cooled off appreciably, technical correction seemed to have got well underway.

But the timely revival of monsoon and reports of fairly satisfactory rains in almost all the important kharif areas had an electrifying effect on the general trading sentiment. Bulls reappeared on the scene. The sharp decline in carry-forward charges from a record high of 60 per cent to just 12 per cent emboldened bulls to assume an aggressive posture. In just three trading sessions on July 16, 17 and 18, the market not only recovered all the ground lost since the end of June but dashed its way to altogether new high ground. The *Financial Express* equity price index for Bombay registered a rise of nine per cent in three days and the all-India index rose by eight per cent.

The stock market bulls do not appear to be the least bothered by the thought that the renewed upsurge which has lifted equity prices to well above the "unreasonably high levels" has enhanced the risk of institutional sales. Apparently they are well prepared to absorb all the stock institutional investors might offload. Nor is the market inclined to pay any serious attention to what economists have to say about infrastructural inadequacies, increase in government's non-productive expenditure, low capacity utilisation, technological obsolescence and shortage of resources for financing the public sector outlay envisaged in the Seventh Plan.

The stock market is convinced that the policy initiatives the government has already taken and proposes to take—the Budget proposals, long-term import-export policy, relaxation of MRTP restrictions, delicensing of a number of industries, the proposal to formulate a new fiscal policy coterminous with the Plan—have created an altogether new environment in the country.

Record approvals by CCI for raising capital by non-government companies during the first four months of 1985 as also the impressive increase in the number of letters of intent, industrial licences and foreign collaborations and the marked acceleration in the assistance provided by financial institutions are cited as indicative of the emerging economic and industrial boom. Judging by the registration of industrial projects with the secretariat of industrial approvals, the response to the government's new liberalised industrial licensing policy has indeed been very impressive. That the private corporate sector has never enjoyed the kind of operational freedom it has now been allowed will be readily conceded. But the stock market is perhaps taking too much for granted. The wide fluctuations in equity prices which have become the order of the day underline the need for utmost caution.

(2) Figures in brackets denote percentage variation over previous period.

# R and D Based Growth

**Hansavivek**

*HINDUSTAN LEVER* is setting its sights higher. It has submitted applications to the government for approval of investments in several projects in chemicals, petrochemicals, export-oriented ventures, etc. Meanwhile, its fertiliser complex project at Haldia in West Bengal has reached an advanced stage of erection. The drug intermediate project at Jammu has already been commissioned. The export-oriented herbicides project at Kandla was commissioned in June 1984 and the company exported 528 tonnes of the product during the year. The company has turned in good results for 1984 which was the first year when the full impact of transfer of domestic businesses of edible fats, dairy and AFS to Lipton India, pursuant to the scheme of reorganisation, influenced business operations. The company's turnover amounted to Rs 539 crore against Rs 501 crore in the previous year, even though Rs 66.60 crore relating to the transferred businesses was excluded. The increase of turnover from the rest of the businesses more than made up for the shortfall attributable to the transferred businesses. Gross profit was only a shade lower at Rs 54.85 crore against Rs 55.98 crore. With reduced provisions for depreciation and taxation, however, net profit increased from Rs 18.56 crore to Rs 21.68 crore. The total dividend of 24 per cent is covered 1.93 times by earnings as against 1.77 times previously. The company continued its thrust in exports, and export turnover, including that of subsidiary, reached a new high of Rs 74 crore. The new 100 per cent export-oriented ventures in the KFTZ for the manufacture of herbicides and garments registered export orders valued at over Rs 13 crore in the very first year of commercial production. The company also made fresh inroads in the North African markets by exporting detergent powder and packaged tea, and consolidated its position in Europe and Japan for exports of value-added sal fat. Prices of non-edible soap making oils increased abnormally during the year.

R and D efforts enabled the company to bring about some economies in manufacturing costs and reduce the impact on the end price of the products. The company was particularly successful in reducing the cost of Surf detergent powder which enabled it to hold prices for the fourth year in succession. The modernisation of manufacturing units and cost effectiveness programmes in the soap and detergent factories progressed satisfactorily. Sales volumes of nickel catalyst and fine chemicals improved substantially as a result of higher demand. Capacity utilisation of the STPP plant at Haldia continued to be good. Commercial sales of Plant Growth Nutrient were started on receipt of industrial licence. Initial reports of farmer acceptance of the product have been very encouraging. The demand for personal products continued to be buoyant but could not be fully met, as the company experienced some production constraints. R and D continued to provide excellent support to all sections of the company's business. Results from Indonesia and Philippines, as also reports from ICAR regional stations and Agricultural Universities supported the company's own research findings in respect of the efficacy of Plant Growth Nutrient for increasing crop productivity. Molecular level investigation into the structure of the soap system is showing the way for more efficient use of non-conventional inedible oil resources that are becoming scarce and expensive. Tissue culture for multiplication of coconut, cardamom and sugarcane, recombinant DNA technology to produce single cell oil, development of novel immuno diagnostic kits and the company's discovery of the concept of 'shadow nutrients' are some other key points of the basic research activity that are expected to break new business grounds for the company. Hindustan Lever Research Foundation organised a symposium on 'Oilseeds Production and Utilisation—Constraints and Opportunities' at New Delhi in September 1984 to focus attention on solving the edible oil shortage in the country. Eminent agricultural scientists, government officials, representatives of industry, the farming community and voluntary agencies participated in this symposium. The proceedings of the symposium have since been published as a book.

*DUNLOP INDIA* has suffered a setback in its working results during 1984. Although sales have been only modestly lower at Rs 227 crore against Rs 239 crore in the previous year, gross profit has dropped from Rs 14.37 crore to Rs 7.63 crore and net profit from Rs 5.70 crore to Rs 1.91 crore even when there is no tax liability which had taken away Rs 2.75 crore previously. The total equity dividend has been slashed by half to 10 per cent which too is slightly short earned. The decline in sales was due to competitive conditions in many of the company's markets. This was particularly so in the tyre market where, since 1983, there has been an increase in manufacturing capacity, which is now well in excess of current demand. The sharp fall in profit margins has been caused by significant cost increases, particularly in regard to raw materials. To a large extent, the impact of these additional costs was offset by achieving a more profitable product mix in sales. This benefit, however, was neutralised by higher selling and administrative expenses, which increased by more than Rs 4 crore over the 1983 levels. Interest charges on borrowings also increased. Moreover, the rise in unit cost of energy used in production has had a considerable bearing on cost levels. Not only did costs rise but the incidence of unannounced power cuts continued to adversely affect plant operating efficiency, particularly at the Sahaganj factory. Steps are being taken to increase captive power resources, but Sahaganj suffered also from variable quality of coal whose thermal capacity is sometime so low that steam pressures in the factory fall below service requirements. J E S Hammond, Managing Director, assures shareholders that these two aspects are receiving priority attention from the management in consultation with the appropriate authorities. The company fared well on the export front and increased export sales by 56 per cent.

Capital expenditure amounted to Rs 16.10 crore as against Rs 8.23 crore in 1983. This includes expenditure in respect of technological upgradation and plant modernisation in selected areas. Commitments for capital expenditre at the end of the year amounted to Rs 6.54 crore. The company floated a non-convertible debenture issue of Rs 10 crore bearing interest of 15 per cent per annum, which was fully subscribed. L J Thompsett, Managing Director, retired from the board on May 20, 1984. Hammond joined the board as the new Managing Director on the next day. M R Chhabria was appointed additional director from December 15, 1984 and S Goenka was appointed Deputy Managing Director from the same date. J H Bell and B S Mehta were appointed additional directors from April 2 last. During the year, 67,65,229 equity shares were transferred by Dunlop Holdings, UK, to Dunlop Rim and Wheel Company, UK. Land and buildings of the company, last revalued in 1981, have been revalued afresh and an amount of Rs 7.4 crore representing the increase in value of these assets over the net book value has been transferred to the Revaluation Reserve. The subsidiary, India Tyre and Rubber Company, suffered a fresh loss during 1984. In view of the severe over-capacity in the industry leading to unremunerative price levels in truck and bus tyres, the operations of the company have been scaled down and the board is in the process of looking at other areas of diversifications.

*BASF INDIA* has been issued a letter of intent by the government for manufacturing 40,000 tonnes of caprolactum and 90,000 tonnes of ammonium sulphate per annum at Jagdhishpur in UP. The management is taking necessary steps to convert this letter of intent into an industrial licence. Meanwhile, the company has fared better during 1984. Its turnover has increased from the previous year's Rs 24.02 crore to Rs 29.56 crore and gross profit from Rs 2.55 crore to Rs 3.19 crore. These figures also show a small improvement in margins. With increased provision for depreciation and a tax liability of Rs 10 lakh against nil, net profit has turned out to be a little lower at Rs 1.13 crore (Rs 1.16 crore). Dividend has been stepped up by two points to 12 per cent and is covered 3.26 times by earnings as against 4.07 times previously. During the year, agrochemicals recorded an increase of 39 per cent in turnover and speciality plastics 10 per cent. Dyestuffs, the turnover of which was within the limit of FERA, registered a decline. Leather chemicals showed a 35 per cent increase in turnover. The Bokaro plant commenced commercial production during the year. The company experienced shortages of certain key indigenously manufactured raw materials and had to make up the shortfall by imports.

*ATUL PRODUCTS* intends to diversify and increase its activities further in the field of basic chemicals, pharmaceuticals, agricultural chemicals, resins and intermediates while maintaining its strong position in the dyestuff industry. It has already received a letter of intent for manufacturing a substantial quantity of intermediates for agricultural chemicals. The company has been making vigorous efforts to reduce costs. The Chairman, Siddharth Kasturbhai, however, points out that the prices of basic chemicals in India, which have already been high, would further increase steeply as a result of the last budget. The increase of duty on crude oil has pushed up prices of benzene and toluene, basic raw materials for the chemical industry. The price of energy sources, such as furnance oil, LSHS, petrol, diesel and kerosene have also gone up. There has also been a hike in the railway freight. According to him, the increased cost to the company due to these factors will be over Rs 3.5 crore. Referring to the tragic incident at Bhopal, the Chairman has observed that industrial safety for workers and the plants is becoming more and more important for the chemical industry. The company's plants have been carefully designed keeping in mind the safety angle. Both the workers and the staff are being continuously trained to understand, appreciate and follow safety instructions through lectures, group meetings, films, safety demonstrations, etc. After the Bhopal tragedy, the company has undertaken a total in-depth review of its own safety organisation. A special committee of senior technical experts is carrying out a thorough reassessment of safety procedures. In order to achieve environmental conservation, the company has put up a modern liquid effluent treatment plant in consultation with a reputed firm of environmental experts, the National Oceanographic Institute and the State Water Pollution Control Board. If necessary, the company detoxifies its liquid effluents at individual plant levels, where the volume of effluents are small and easy to treat. Whenever a new plant is put up or an existing plant modified, care is taken to put up equipment to reduce contaminants. This has been done by installing a DCDA system in the new sulphuric acid plant, elimination of mercury from hydrogen gas, reducing mercury contaminants from the caustic effluent to acceptable levels and evolving alternative processes such as hyrogenation to replace iron-reduction processes that produce solid waste. The Chairman concedes that the industry must take maximum precautions in handling chemicals like drugs, dyes, fertilisers, plastics, etc, and society and the government should certainly see that such precautions are taken. He, however, observes that they should not overreact against the industry because such discouragement of the industry will be counterproductive to national progress.

*NIPPON DENRO ISPAT*, a new company promoted by M L Mittal and associates, is setting up a Rs 14.5-crore project for annual manufacture of 35,000 tonnes of galvanised plain corrugated sheets in thin guages in a 'D' class backward area in the Nagpur district of Maharashtra. At present, thinner guages of sheets ranging from 0.40 mm to 0.18 mm thickness are not manufactured in India, and for its requirements the country is wholly dependent on imports. GP/GC sheets are primarily used for the construction of roofs/side walls of residential/factory buildings and are also being increasingly used in engineering industries, automobiles, electrical appliances, pipes and ductings, furniture, etc, due to their high corrosion-resistance and long life. The plant is being set up with technical knowhow from Nippon Denro Manufacturing Company, Japan, world-renowned manufacturer of steel sheets processing equipments. The main plant section and critical equipments are also designed and manufactured by this Japanese firm. The company proposes to enter the capital market shortly with a public issue of Rs 195 lakh to raise a part of the project cost. Trial runs at the plant are expected to start by July 1985 and commercial production should begin thereafter. The management estimates that the plant will be capable of producing 30,000 tonnes of galvanised plain corrugated sheets in the first year of operation. On this basis, the expected turnover of the first year's operations is expected to exceed Rs 50 crore and would enable the company to declare a maiden dividend.

# Looking at the Constitution

### Romesh Thapar

DESPITE all the alarums in the newspapers, and the commentaries on this and that problem, the central thrust of all discussion in political circles is around the chaotic state of the nation and the paralysis that has overcome all governance. Parallel to this discussion is the speculation about who will rule India if the present coteries collapse—a very important element in our present situation.

Within the chaos, the bye-elections are not really suggesting a definite trend. These contests are so trapped in local caste battles and local influence that they cannot be relied upon as conclusive pointers to changing alignments. But the pattern that is emerging reflects the chaos. Coherence is disappearing.

The political discussion will soon anchor on the Congress(I) breakdown in the South, its isolation in Gujarat and Maharashtra and its apparent splintering in Uttar Pradesh and Bihar. All this means a receding majority. Will the fear of the spreading chaos persuade Congress supporters to rally round their party or push them into other expectant arms? All election studies continue to suggest that the poor and deprived have a fatal fascination for the Congress now posturing as Congress(I). This anchorage might well be decisive, particularly if the Muslims, largely poverty-stricken, do not begin to scatter their votes in anger. The Sikhs are too divided and confused.

The heart of the crisis, of course, is what everyone describes as the lack of an alternative. At the moment, this means a personality or personalities. But the truth is that there is little to distinguish one bunch of politicians from another. A massive, and entrenched, mafia now exists to take care of all the political formations. Once upon a time, the Birlas played this role. Now, there are dozens of Birla-like operators pulling the strings. The cost of elections, the many distortions in facing the electorate, and the overriding desire to amass independent wealth, and the total absence of programmatic commitments, have put the lid on this process of establishing a *status quo* situation around the elections.

Disaffections, fronts (papered over or pampered by various interests), conclaving between disparate elements, seminaring, workshopping, seed-sowing, etc, etc, are important only to the extent that they facilitate a shaking up of the present game of make-belief democracy. Such a shake-up might yield new equations of thought and new combinations of concern. We might even witness the birth of a new party, a party of renewal, a Bharat Desam. The effort towards this end will intensify as the chaos increases and the opportunist fronts lose their inferior cement.

Certainly, even as these stirrings become visible, the old publicising of a presidential system will probably resume. There's no doubt that much of the advocacy for a presidential system—it is never made clear whether it is the highly centralised French model or the very decentralised US structuring that is sought!—will invariably be advertised as having the approval of whoever rules or attempts to rule. What interests me is that the courtiers haven't as yet explained how political stability is to be built into the presidential system.

Mind you, given the demented state of our rulers, a prod here or there could yield a harvest of suggestions designed to make the presidential system look monarchical. Actually, some articles are already providing such a tincture as a touch of authentic Indianness. In the Central Hall of Parliament, some princelings, after all, have been reminding their somewhat demoralised colleagues that the only segment of the Hindus which had some touch with the forgotten sense of rulership was the Rajput! Obviously, a commentary on the brahmins in power, and their servile supporters among the middle and lower castes.

Joking apart, with daily attendance in Parliament's two Houses really not recovering—even though it is higher than in Indira Gandhi's days—a large body of thinking opinion is beginning to feel that a kind of terminal disease has overtaken our democracy. The Antulays, the Adiks, the Jagannath Mishras, the Solankis, the Bal Thackerays, the Gundu Raos, the Shuklas, the G M Shahs, the Patils, the Charan Singhs, the Moilys, the Jathedars, and battalions of Aya Rams and Gaya Rams, have just about pummelled the system into a streamlined infrastructure for graft and aggrandisement. 'Terminal' may well be the right world, but renewal has to begin what is with us region-wise—for, we are unlikely ever to throw up a revolutionary response on a continental scale.

Is it possible to take this crisis of the system more seriously, and to lift it above current political permutations and combinations? Constitutional reform, adjustment, alteration, modification, is part of the process of growth and change. These few years of freedom have seen such transformations that we need to review many of the notions and concepts which influenced us in the late forties. Done with responsibility, and with a firm commitment to a future society based on true democratic involvements, genuine secular responses and justice, there is no reason why the present constitutional structure cannot be made more viable and strengthened.

If the ruling party functions only on the margins of manipulation, and to perpetuate the hateful dynastic kow-towing, then it is the duty of persons like Faroukh Abdullah, Jyoti Basu, R K Hegde, N T Rama Rao, associated with respected figures Chandra Shekhar and Atal Behari Vajpayee, to take the initiative to establish a body to undertake this task within a strict time-frame. The country does not lack serious constitutional talent, or the various types of expertise required to do the job with speed and precision. Only the absence of a determined political will to conduct a thorough exercise places us at the mercy of those who would twist the Constitution for their narrow and very short-term objectives, even give it extraordinary lawless dimensions.

It is a situation that needs urgent resolution. To keep stamping around the present non-working *status quo*, and to oppose any attempted constitutional changes without proposing genuine alternatives, is to invite isolation and defeat. This is what has been happening as trial balloons have been sent up in the past by various Congress(I) factotems. And now, this ruling party enjoys the kind of strength in Parliament to sow the seeds of authoritarianism in the Constitution.

In fact, the people of India, a majority of whom still follow the fortunes of the Opposition parties, would acclaim a Constitution-reviewing thrust were it to be sponsored by the next 'conclave'. It would be a refreshing change from the familiar competition in charismas and rhetoric. We are so tired of these tawdry performances—yes, from that man with the 'inner charm' to the aged mountebanks still living on past glories, and to the younger echelons still modelling themselves on characters who have lost, or are losing, their relevance. Enough is enough.

*July 12.*

# THE TATA ENGINEERING & LOCOMOTIVE COMPANY LIMITED

## Statement of the Chairman, Mr. S. Moolgaokar, for the year 1984-85

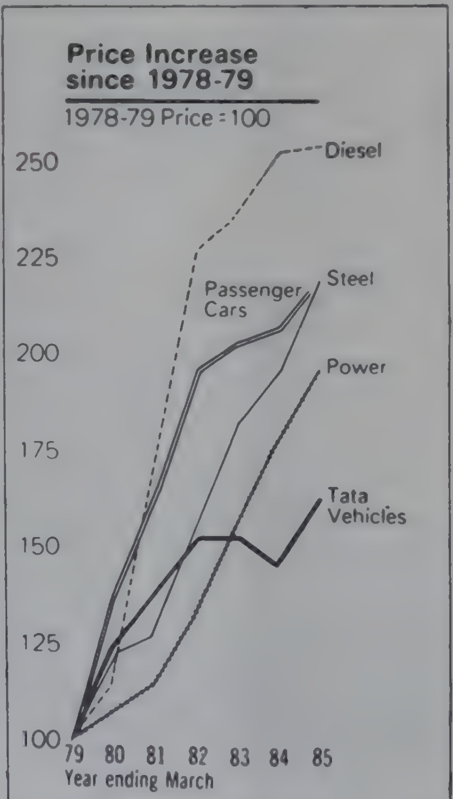
Our country went through traumatic times last year. Yet, even as the year drew to a close, the nation reinvigorated itself under the fresh leadership of our new Prime Minister. Mr. Gandhi's Government faces many problems, but it has chosen to tackle them with pragmatism — divesting itself of the pseudo-ideologies that have shackled the economic strengths of our country for so long. In his attempts at rapid industrialisation, the Prime Minister has sought the cooperation of the private sector. He has given concrete shape to this desire through the budget and through several other policy measures that have been announced in the past few months. It is now for us from industry to respond: by producing more goods, improving productivity and enhancing net foreign exchange earnings. Of course, Government can and should do more. But this is no time to ask and wait for yet more concessions. All of us in industry must show that the faith our Prime Minister has put in us is not misplaced.

We, in Telco, find the new emphasis congenial to our way of working and shall attempt to play our role as constructively as we can. Quite apart from the revenues we generate for the exchequer (which in 1984-85 amounted to Rs.265 crores directly, and several times higher through indirect means), we believe we have a vital contribution to make in the task of building the nation's automobile industry quickly and effectively. But before touching on the plans we have for giving concrete shape to our commitment, I must report what Telco has achieved in the year that is over.

### TELCO'S PERFORMANCE

With its close linkage to the economic mainstream of the country, Telco's fortunes seemed to follow those of the nation. Demand during the first eight months of the year fell short of expectations. By December 1984, however, performance began to catch up and we ended the year with higher sales than in the previous year. Exports touched Rs 63 crores, in spite of increasingly fierce competition in foreign markets

A relentless push in costs kept profitability squeezed. Prices of steel tyres and bought-out items increased substantially during 1984-85. To partially neutralise some of the increasing costs, we were obliged to increase our vehicle prices in April 1985.



### NEW COLLABORATIONS

The last year set two other landmarks in Telco's history: the first Tata-Hitachi excavator was delivered towards the end of the year. The Hitachi Construction Machinery Co., our collaborators in this venture, are world leaders in hydraulic excavators. The collaboration is proceeding smoothly and facilities for spares, service and training of operators and mechanics are being established with their assistance.

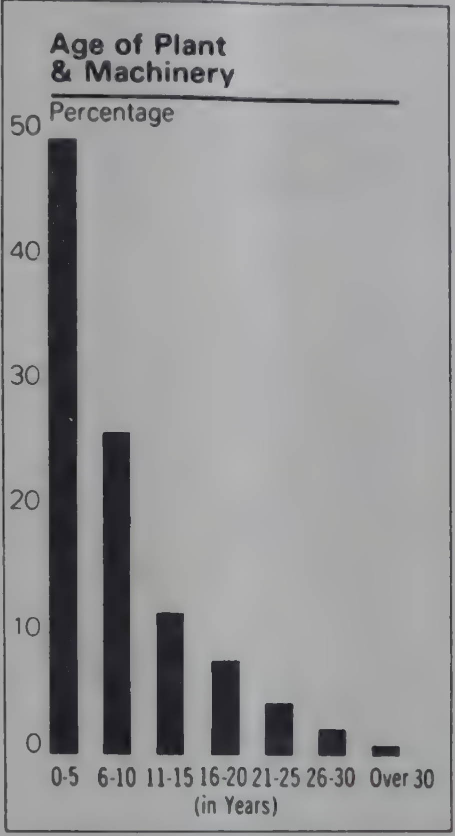
We have also entered into technical collaboration with Nachi Fujikoshi and Niigata of Japan for the production of numerically controlled flexible machining lines and machining centres. A large number of our professionals are now under training in Japan and India. We are setting up an electronics division at Pune. It will be manned by top-class electronic engineers and will produce the controllers for machine tools. These engineers will also spearhead our efforts in factory automation and will support the maintenance of the sophisticated and expensive machine tools which will enable us to produce efficiently, even at a low volume, a variety of components and aggregates necessary for upgrading and widening the range of our vehicles. We shall produce and use more and more such machines in the years to come.

## RESEARCH & DEVELOPMENT

In my previous statement, I had mentioned that our R&D capabilities were being strengthened. Much progress has been made since then. Our team of design and development engineers is being provided all the support they will need, so that their abilities can be used more productively. Computer-aided design and engineering centres have been set up at Pune and Jamshedpur. These are now operational and are offering increasing assistance to our technical staff. A number of modern testing facilities are also being installed. Resource constraints have prevented us from doing more. I assure you, however, that the development of our R&D facilities will receive the highest priority, for that is vital for our growth in the competitive years that lie ahead.

Our main vehicle lines continue to use the latest technology for high-volume production. In several of the new segments we are entering, however, the maximum number of vehicles that can be sold in India at the moment would not be considered large by any international standards. Yet, we must remain price-competitive. We plan to resolve this seeming contradiction by exploiting the flexible manufacturing technologies that are transforming the automotive industry.

The infrastructure we have built over the years and the experience we have gained in building it has given us a head-start on the road to developing a strong automobile industry for our country. Today, we are in a position to upgrade our present products and widen our range with the most efficient use of capital and the least import of capital equipment. Telco's ability to continually create the new strengths it needs, comes from the efforts it makes to rejuvenate its people through training and its plant through fresh investment. As a result, though Telco has been making automobiles for over 30 years now, the average age of the plant and machinery employed in the Company works out to only 8 years — and much of it represents the latest in technology.



## LIGHT COMMERCIAL VEHICLES

Among the various new products that Telco is developing, I should make particular mention of two series of light commercial vehicles which will be designated as the 407 and the 608 series. The 407 series has already gone through the design and development stage and has completed field and preproduction trials. It will be ready for commercial production by December 1985. The 608 series will be introduced soon thereafter. These vehicles have been designed from scratch for Indian conditions. Apart from some special steels we are forced to import, the vehicles will have a hundred per cent indigenous content from the very start. At the same time, they will satisfy international parameters of performance. Being suitable for a variety of applications, I am confident they will gain a substantial share of the rapidly growing market for this class of vehicles.

The new vehicles are not just additions to our increasing range of commercial vehicles. They are the expression of our ability to design and produce in-house all the aggregates as well as the tooling needed for bringing out a totally new vehicle. Our expertise in manufacturing heavy press tools is itself a result of 20 years of skill-building in a technology where there is no substitute for experience.

Customers for the 407 and 608 vehicles will have access to the same extensive service network and spare parts facilities which cater to the lakhs of our vehicles already on the road. We are also opening eight additional stocking points to feed spare parts more speedily to the existing outlets.

## PASSENGER CARS

The lead we have in commercial vehicles will help us acquire a similar position in the passenger car market which has been opened to us for the first time as a result of the timely liberalisation of licensing policies for automobile manufacturers. We have yet to take a final decision on the collaborator with whom we shall join hands. We are certain, however, that with the commitment to quality, the large pool of trained manpower and the extensive manufacturing and service infrastructure Telco has already built, the cars we field will come out on top.

## TO THE TELCO FAMILY

It is difficult to allocate thanks after a year which starts as dismally and ends as happily as the last one did. Every part of the Telco family of employees, suppliers and dealers worked hard to cope with the massive fluctuation in demand during the year. They have richly earned the praise that I am sure you, as shareholders, will grant. To the members of our ever-responsive family, I make a special appeal: we are now going to face some keen competition. I have no doubt we will all enjoy meeting it and will attain still higher levels of quality and performance — matching international standards. We will emerge from the experience with renewed pride and confidence in the position we hold at the forefront of the country's automobile industry.

---

# New Phase in Sino-Soviet Relations

### GPD

> The barbarian affairs are fundamentally difficult to manage, but the basic principles are no more than four words of Confucius—*chung, hsin, tu* and *ching*, faithfulness, sincerity, earnestness and respectfulness . . . Hsin means merely not to tell a lie . . . We should start to work on the basis of this word.
>
> —Tseng Kuo-fan, Manchu commander in his letter to another Manchu official, 1862.

GOING by recent developments it would seem that Deng Xiaoping and his men are making some progress on the question of the barbarian affairs. The barbarians concerned in this particular case are, of course, the Russians. Yao Yilin has just concluded a trip to Moscow and by all accounts it has been a resounding success. The economic content of Sino-Soviet relations will now go up to twenty billion dollars. That's, of course, trade. More interestingly, the Soviets have decided to intervene in the technology market that Deng's China promises to be. The Japanese, the West Europeans and to a lesser extent, the Americans are there in the market already with their respective technology packets. The Soviets were so busy scoring points about moral superiority over the Chinese all this while—'we are less contaminated by imperialist contacts', and so on, which in any case was not particularly true—that they forget that it makes bad foreign policy sense to wait for China's return to socialist virtue as defined by Moscow. Obviously, Gorbachev has seen that ostracisation of China benefits Americans. So why not begin on the basis of *hsin*, i e, on the basis of not telling lies to each other when it comes to buying technology from the advanced world? The socialist world can also sell some technology to China. Gorbachev has decided that he should. Deng Xiaoping seems to have decided that he ought to do business with the Russians on the basis of their word. A new phase in Sino-Soviet relations is about to begin.

We have said a number of times in this column that Sino-Soviet relations are changing for the better. Yao Yilin's visit to Moscow and the agreements which have been reached while he was there together constitute a big leap forward in the stagnant Sino-Soviet relations. The more involved the Soviets get in the 'modernisation' programme in China, the closer and better will the Sino-Soviet relationship be. Before long the other East Europeans, particularly the Czechs and the Hungarians and slowly the East Germans will enter the Chinese arena and soon everybody will start rediscovering the socialist character of China.

The last few months have also indicated certain changes in strategic perspective, particularly as it relates to South and South-East Asia. Chinese interest in Afghanistan has always been marginal; lately it has further declined (though not disappeared). The real issue between the Soviets and the Chinese has been the future of South-East Asia, more particularly Indochina. Deng Xiapong said on April 17 that if the Vietnamese withdrew their troops from Kampuchea, China would not object to the Soviet military presence in Cam Ranh Bay. It was obvious that the Vietnamese would reject such a *quid pro quo* between the Soviet Union and China. But that is not the issue. What is interesting about this proposal is that Deng Xiaoping is no longer alergic to the Soviet military presence (in this case, a long-term or semi-permanent presence). The reasons are not far to seek. Asia east of India is dominated by the US or pro-US powers. The Chinese ignored this situation throughout the seventies in order to make their presence felt in world politics. They have achieved that objective now. A shift is in order. The shift, of course, would not consist of turning anti-American. Rather it would be one of looking for a countervailing presence. Only the Soviets have the wherewithal with which to establish such a presence. The Chinese, in short, would want the two 'super-powers' to balance each other. Precisely such balancing requires that China has a normal, working relationship with the Soviet Union.

It would appear that the Soviets have also perceived that the Chinese understanding of the strategic situation in South Asia and have felt the need to signal the Chinese that no problem between the two powers is insuperable. In a remarkable move, the Soviets downgraded Le Duan's visit to Moscow in the last week of June. The protocol operations in connection with the Le Duan visit must have told the Chinese quite a story. More significant than that was the joint declaration between Gorbachev and Le Duan. The declaration, signed on June 30, had this to say on the subject of China: "Normalisation of the relations of the Soviet Union and the Socialist Republic of Vietnam with the People's Republic of China" contributes to the "aim of strengthening peace in Asia and international security". The meaning of such a clause finding a place in a Soviet-Vietnamese joint declaration hardly needs elaboration.

The change in the Soviet position is quite clear. The Chinese must have seen that in the whole of Asia east of the Khyber Pass the American star is rising. Deng may not have immediately to worry about this. But in the long run the decline of the Soviet Union in the entire area south of China simply recreates a situation comparable (in strategic terms) to the one the Chinese faced throughout the fifties and the sixties. It is unlikely that Deng does not see the significance of what South-East Asia would be like in a decade or two without the Soviet presence. There is as yet no Chinese statement which will establish that beyond doubt. But that is in fact the Chinese understanding. Deng Xiaoping's tolerance of the Soviet military presence in the Cam Ranh Bay would suggest that.

Of course, this is still not final evidence of impending Sino-Soviet normalisation. There are bound to be zig-zags. What these pieces of evidence indicate is really the general direction. Our policy-makers will have to be very alive and sensitive to these shifts. We have so far treated China an exclusive preserve of the External Affairs Ministry. Anybody outside it trying to take a sober view of China has been treated with extreme hostility. We know of China experts who are anathema to the Ministry because they say things today which the Ministry will say tomorrow. It is amazing how and why a self-defeating blindness takes over our External Affairs Ministry people in the matter of writings on China. Over a period of time such an attitude can result in insensitivity to small but subtle changes in China's positions and therefore in South-East and East Asian politics. Anyway, it has become increasingly necessary to carefully monitor the shifts and changes in the Sino-Soviet relations. One must remember what Tseng Kuo-fan said at the beginning of the passage quoted above: the barbarian affairs are fundamentally difficult to manage!

**TRIPURA**

# Tribal Areas Autonomous District Council Elections

**Malabika Das Gupta**

THE Tripura Tribal Areas Autonomous District Council (ADC) elections were held on June 30, under the Sixth Schedule of the Constitution.[1] The main contenders were the Left Democratic Front consisting of the constituent parties of the Left Front—the CPI(M), CPI, FB and RSP—and the newly-formed Tripura Hill People's Party on the one hand and the Congress(I)-Tripura Upajati Juba Samiti (TUJS) combine on the other. The CPI(M) had fielded 21 candidates, the Tripura Hill People's Party four and the CPI, FB and RSP one each while the TUJS and Congress(I) had fielded 18 and 10 candidates respectively for the 28 seats in the ADC.

The LDF has emerged victorious in the elections, winning 15 out of the 28 seats. The remaining 13 seats have gone to the Congress(I)-TUJS combine with the Congress(I) winning three and the TUJS winning 10 seats. All the seats bagged by the LDF have been captured by the CPI(M) which has emerged as the single largest party in the newly-elected ADC. Out of the 21 reserved seats for scheduled tribes, 11 have been won by the CPI(M) and 10 by the TUJS, thus giving the CPI(M) a lead over the TUJS as far as the reserved seats are concerned. The Congress(I) has failed to make a headway in any of the reserved constituencies.

The constituency-wise position of the two main contenders in the 1985 elections and in the ADC elections held under the Seventh Schedule of the Constitution in 1981 is shown in the accompanying Table. It can be seen that the LDF has won a smaller number of seats in 1985 than in 1981 when the LF fought the elction against the TUJS, the Congress(I) having boycotted the election. The TUJS had won seven seats in the last ADC election while the Congress(I)-TUJS combine has won 13 seats this time and have wrested seven seats won earlier by the Left Front. Only one seat won earlier by the TUJS has gone to the LDF in this election. The LDF has retained 14 of the 21 seats the LF had captured in 1981. Moreover, in five of these 14 constituencies, the LDF has secured a smaller number of votes than the LF did in the 1981 election and the TUJS-Congress(I) combine has increased the number of votes.[2] Again, in 11 of these 14 constituencies the LDF has won by a smaller margin over the TUJS-Congress(I) combine this year than the margin by which the LF had won in these constituencies over the TUJS in 1981.

Though the Left has retained its leading position in the newly-elected ADC almost by the skin of its teeth, it has to be remembered that it fought against tremendous odds. First of all, the combined forces of the TUJS and Congress(I) ranged against it in this election as against only the TUJS in the last one. In a bid to secure a foothold in the ADC the Congress(I) joined hands with a regional party which has often fanned the 'Swadhin Tripura' sentiments of a certain section of tribals and has tried to create divisions between the tribals and Bengalis in the state. For example, during the election campaign, the TUJS had declared that it would introduce the 'permit system' in the ADC area if it secured a majority in the ADC and also said that the Bengalis were free to leave the ADC area if they wished to do so. Not a single word was uttered by the Congress(I) against these statements of the TUJS in the hope of making narrow political gains. Just before the election, the Congress(I) and the TUJS unleashed a reign of terror in the ADC area, intimidating voters in general and supporters of the LDF in particular. They did not stop short of enlisting the support of the TNV and the TSF for their heinous activities. The killings in Raipasha and Dolubari were designed to start a communal carnage of the type witnessed in the state in 1980 and were carefully engineered by them. A lot of money reportedly flowed into the state to buy votes and a villification campaign was mounted against the Left Front by its adversaries with the help of the Congress(I) MPs and Ministers from the Centre and Assam. False hopes of jobs for all poor tribals voting for the TUJS-Congress(I) combine were also raised in a bid to woo the voters.

This carrot and stick election strategy succeeded in winning over some voters, especially in the Sadar and Udaipur subdivisions. The victory of the LDF, though narrow, despite the tremendous odds shows the faith of the majority of the tribals and non-tribals living in the ADC area in the policies and programmes of the Left Front. They have given a mandate to the LDF in recognition of the work done by the ADC constituted under the Seventh Schedule of the Constitution despite the narrowness of its scope for action and in the hope that under the provisions of the Sixth Schedule the ADC will rise to new heights with the LDF in leadership in solving the problems of the backward areas of the state inhabited mainly by the tribals.

The newly-elected ADC under the leadership of the LDF has a challenging task ahead of it. It will have to try to fulfil the expectations of the people and also set up an example for the rest of India as it is the only ADC constituted under the Sixth Schedule of the Constitution for a number of tribes taken together. It will have to secure more funds from the Centre to put its plans into action and help in maintaining com-

TABLE: WINNERS IN THE 1985 AND 1981 ADC ELECTIONS

| Constituency | 1985 | 1981 |
|---|---|---|
| 1 Damchara-Jampui (ST) | LDF | TUJS |
| 2 Machmara | Cong(I)-TUJS | LF |
| 3 Dasda-Kanchanpur | Cong(I)-TUJS | LF |
| 4 Karamcharra (ST) | Cong(I)-TUJS | LF |
| 5 Chamanu (ST) | LDF | LF |
| 6 Manu-Chailangta | Cong(I)-TUJS | LF |
| 7 Damcharra-Kachucharra | LDF | LF |
| 8 Ganganagar-Gandacharra (ST) | LDF | LF |
| 9 Halahali-Asharambari | LDF | LF |
| 10 Kulal-Champahaur (ST) | LDF | LF |
| 11 Maharani-Teliamura (ST) | LDF | LF |
| 12 Ramchandraghat (ST) | LDF | LF |
| 13 Simna-Tamakari (ST) | LDF | LF |
| 14 Bodhjungnagar-Wakkinagar | Cong(I)-TUJS | LF |
| 15 Jirania (ST) | Cong(I)-TUJS | LF |
| 16 Mandainagar-Pulinpur (ST) | LDF | LF |
| 17 Pekuarjala-Janmejoynagar (ST) | Cong(I)-TUJS | TUJS |
| 18 Takarjala-Jampuijala (ST) | Cong(I)-TUJS | TUJS |
| 19 Amtali-Golaghati (ST) | Cong(I)-TUJS | TUJS |
| 20 Killa-Bagma (ST) | Cong(I)-TUJS | TUJS |
| 21 Maharani-Chelagang (ST) | Cong(I)-TUJS | TUJS |
| 22 Kathalia-Mirza-Rajapur | LDF | LF |
| 23 Ompinagar (ST) | Cong(I)-TUJS | TUJS |
| 24 Raimavalley (ST) | LDF | LF |
| 25 Natunnagar-Malbasa | LDF | LF |
| 26 Birchandranagar-Kalshi (ST) | Cong(I)-TUJS | LF |
| 27 Purba Muhuripur (ST) | LDF | LF |
| 28 Silachari-Manubankul (ST) | LDF | LF |

munal amity between the tribals and the Bengalis without which its developmental work will be jeopardised. As the recent killings in Bagafa and Kaityabari show, the reactionary forces which have failed to secure a majority in the election will try their level best both inside and outside the ADC, through foul means and fair, to prevent the LDF majority in the newly-elected ADC from operating in a normal atmosphere to redeem its election pledges. In the final analysis, the record of performance of the newly-elected ADC will determine, to a large extent, how successful Tripura is going to be in containing extremist and secessionist tendencies in the state.

### Notes

1 For a history of the ADC and a record of its performance, see Malabika Das Gupta, 'Tribal Unrest in Tripura: An Alternative View', *EPW*, January 5, 1985, pp 38-40 and 'Left Retains Tribal, Rural Support', *EPW*, February 16, pp 263-264.

2 In one of these five constituencies the LF candidate had been unanimously elected in the 1981 elections.

## ELECTRONICS

# No Stomach for Competition

### Arun Goyal

IN spite of all talk of exposing the local computer industry to import competition, government policy on computers continues to be swayed by the short-term interests of assemblers. In November last year, the industry's cost structure was lowered significantly when customs duty on peripheral components was reduced to just six per cent (complete peripherals attract duty at 60 per cent in most cases). Since the major cost element in the manufacture of computers is peripherals, it was expected that costs would come down and the benefit would be passed on to consumers. To ensure this, it was declared that computer imports would be put on OGL so that the industry faced import competition.

The next scene in the drama was enacted with the announcement of the Budget on March 12 this year when customs duties on computers were actually raised from 155 per cent to 200 per cent and excise duty at 15 per cent was totally withdrawn. The measure was designed to curtail imports and boost domestic production. Another about-turn took place a month later when the new Import Policy was announced and computers below Rs 10 lakh were put on OGL. The wavering in official thinking was visible since the configuration eligible for OGL was kept deliberately vague. It was stipulated that the computer must have a minimum configuration with 'adequate memory' and two winchester drives (which store huge amounts of data from five megabytes onwards as compared to floppy drives, the normal storage device, where the capacity is generally below one megabyte). Pressure from domestic industry forced government to amend the import policy on April 29; 'adequate memory' was now defined as "main memory of not less than one megabyte and aggregate of basic/memory capacity of not less than 300 megabytes".

This move clearly specified a computer type which could be used only by very large organisation such as the Census Department. The normal computer user has no use for it, specially after paying 200 per cent customs duty. Obviously, the computer manufacturers can now eat their cake and have it too; customs and excise duties on peripheral components have been virtually abolished without the computer manufacturers being made to face international competition. In actual practice, the Central government, which claims to be doing so much to modernise industry and take it into the 21st century, seems to be following the path of taking the easy options. This would have been perhaps the first instance, as part of the recent import liberalisation, of a finished product available in the country being put on the OGL in order to expose domestic manufacturers to competition from imports. This has not happened.

The results of this policy are clear. The fall in computer prices to Rs 50,000 to 60,000 for an eight-bit system as against the Rs three lakh-plus levels some years back has been arrested with the back-tracking on the promised liberal imports. Numerous brands compete with one another making false claims for otherwise similar systems; marketing overheads are loaded on to products to the extent of 100 per cent or even more; and maintenance and software support suffers. There is little standardisation of equipment and compatibility between hardware and software. Software, the key to computer operations, is non-standard and its quality and variety extremely poor compared to international standards.

It is true that competing multinationals produce computers and software which are designed to be incompatible with rival brands. Nevertheless, the variety and quality of software within each brand is sufficient and cheap enough to cover most needs of consumers. What is more, independent entrepreneurs have developed software which are compatible with different brands. Unfortunately, these trends, when reflected in Indian conditions, produce queer combinations. Incompatibility between systems, when copied in the Indian environment where the scales of production are small and government policy inconsistent, produces total incompatibility between Indian systems and international ones.

The choice before decision-makers is clear. Either the industry has to be thrown open to competition from imports which will lead to availability of good quality and inexpensive computers and software. This may lead to greater use of computers and corresponding development in areas of major potential strength such as software. The other option is to develop a desirable scenario for the computer industry in which equipment and software are standardised so that the industry grows in a planned manner. The government seems to have taken the second option since the DOE has armed itself with wide powers to regulate practically every aspect of the electronics industry, including licensing of imports, fixing customs duty, industrial licensing, technology approval, purchases, marketing, and so on. Nevertheless, the industry is moving on a path of virtually free import of components which are assembled into mediocre but expensive products. The powers of DOE are only furthering this type of development. Lack of a consistent policy—licensing policy, for instance, has been through three major shifts in the last seven years—has produced opportunist 'manufacturers' instead of visionary industrialists. What is worse, the weaknesses have assumed structural dimensions. This does not seem to worry the decision-makers.

The DOE has now claimed that computer prices will come down to Rs 30,000 in the near future. It will be interesting to watch what it is able to actually achieve. Its claims to bringing colour TV prices down to Rs 5,000 have not come to much and prices currently range from Rs 7,000 to Rs 8,000, compared with the international price of $ 300. Perhaps the Prime Minister himself should evaluate the results to reward or punish DOE according to its performance. At least this would be one promise to which the government would have lived up to.

## Gwalior Strips

GWALIOR STRIPS, which came to the capital market in November 1984, has commenced commercial production in a record period of 9 months on June 29. The plant with a capacity to manufacture 10,000 tonnes per annum of cold rolled steel strips has been set up in the 'no-industry' district of Bhind in MP. According to the management, the demand in MP itself and in the other adjoining states is around one lakh tonnes per annum. The company has planned to expand its capacity to 30,000 tonnes per annum. It expects to achieve 60 per cent of the capacity in the very first year and has got substantial orders in hand. Since the government has relaxed the import of cold rolled steel strips, the company is assured of adequate supply of raw material for its use.

## WEST BENGAL

# Calcutta Corporation Election

**Biren Roy**

IN the Calcutta civic elections held on June 30, the city voters showed no decisive preference either for the Left Front or the Congress(I). Out of 141 seats, the Left Front won 68, the Congress(I) 67, the BJP 2 and Independents 4. Out of the four independents, two were supported by the Left Front, one was a dissident Congress candidate and another had defeated both the Left Front and the Congress(I) candidates. The last-mentioned was later inducted into the Left Front whose total became 71. It will thus be in a position to take over the reins of running the Calcutta Municipal Corporation. Out of the Left Front's total of 68 seats, the CPI(M) won 49 seats, the CPI 7, Revolutionary Socialist Party 6, Forward Block 5. One Marxist Forward Block candidate who contested and won on the CPI(M) symbol can be regarded as belonging to CPI(M) whose tally thus becomes 50. Out of the seven aldermen that will be elected by the councillors on the basis of proportional representation, four are likely to be won by Left Front and three by the Congress(I). The Left Front's tally in the house of 148 would thus be 75 and the Congress(I)'s strength would be 70. The Congress(I) has already claimed the dissident Congress councillor and the two BJP members, who have so far not declared publicly their role in the civic body, are likely to be more on the side of Congress(I) in the obtaining circumstances. So the Left Front's total of 75 will be poised against 73. This is a precarious majority for running the civic body effectively.

The civic election was important in many respects. It was held after 16 years, the last being held in 1969. It may be recalled that the elected body was dissolved most undemocratically by Congress(I) ministry headed by Siddhartha Sankar Ray soon after its assumption of office in 1972. The Calcutta Municipal Corporation remained superseded under the Congress(I) regime from 1972 to 1977. The Left Front rightly protested against this undemocratic act; but after it assumed office in 1977, the Corporation continued to remain superseded for almost eight years. In the meantime, a new Act, the Calcutta Municipal Corporation Act, 1980 was passed. The delay in ordering civic election by the Left Front government was ascribed to the passing of the new Act and obtaining of President's assent to it. This was only part of the truth. It was evident, especially after 1980, that the Left Front's, particularly the CPI(M)'s, influence in the Calcutta urban area was gradually waning and the Congress(I) was gaining in strength. In the 1982 Assembly elections, though the Left Front won an overwhelming majority in West Bengal, the Calcutta seats were evenly divided between the Left Front and the Congress(I). A new strategy was sought to be adopted by further amending the 1980 Act to include the neighbouring Municipalities of Jadavpore, Behala and Garden Reach in the Calcutta Municipal Corporation. So whereas under the earlier Act, the 1951 Calcutta Municipal Act, there were 100 Wards, the inclusion of these areas raised the number of Wards to 141. This strategy paid dividends as will be seen later.

However, the Calcutta Corporation Municipal Act, 1980 has some unique features. The franchise in Calcutta Corporation election was earlier limited, based on educational and property qualifications. The first election on the basis of adult franchise was held in 1965 when the Congress won; the next election held in 1969 was won by the United Front. This Corporation was dissolved by the then Congress Ministry as mentioned earlier. The 1980 Act lowered the voting age to 18. The Act provides more power to the elected representatives. A Cabinet type constitution has been envisaged by the provision of Mayor-in-Council in which has been vested the main executive power for running the civic administration. The post of Mayor which was more or less an ornamental one has been given powers under this Act analogous to that of a chief minister in a state cabinet. A Chairman's post has been created analogous to that of the Speaker in the state assembly. Provision for forming Borough Committees (15 in number in contiguous wards) has been made, thus decentralising power to a certain extent. This type of a constitution in a Municipal Act perhaps does not exist anywhere in India. Certain tax reliefs to the poor and low-income group people have also been provided in the new Act, which is no doubt far more democratic than the earlier Acts.

The erosion of influence of the Left Front and the CPI(M) in the Calcutta city area reached its climax in the 1984 December Lok Sabha elections when all the Lok Sabha seats were won by the Congress(I). In the 141 Wards of the present city area, the Congress(I) won in 114 and the Left Front got only 27. Against this, the Left Front got 70 and the Congress(I) 67 in recent civic elections. So it was a commendable achievement on the part of the Left Front and the CPI(M); and surely it was a defeat for the Congress. But if the present results are compared to the last elections held in 1969, it will be seen that the Left Front has failed to regain the position it held in 1969 when the United Front got 71 and the Congress 22 in the 100 Wards of the city proper. Moreover, this time also in the 100 Wards of city proper the Congress(I) won 56 and the Left Front only 42; but in the added 41 Wards of the neighbouring Municipalities, the Left Front got 29 and the Congress 12. Against the background of the results of the 1984 December Lok Sabha elections, the Congress(I) definitely expected to win but its expectations have been belied and this led to the resignation of the West Bengal PCC President Pranab Mukherjee, though the resignation was partly for pressurising the Congress(I) High Command.

The Left Front was not very confident of victory, though after the results were published, the Left Front Chairman, Saroj Mukherjee, told the press that they had expected better results.

In the campaign preceding the elections, the Left Front presented a more united posture. It began the campaign earlier also. The Congress(I) was ridden with factionalism and groupism over the question of nomination of candidates. Ashok Sen, Union Law Minister, issued a public statement accusing the state leadership. Even the Congress(I) state office was attacked by a rival group in the party and there were several dissident Congress candidates of whom one won. Factionalism inside the Congress(I) helped the Left Front which seemed to be in ascendancy in the earlier part of the campaign; but in the latter part groupism in the Congress(I) was patched up and it stepped up its campaign. Even Siddhartha Ray, former Congress(I) Chief Minister, was inducted into the campaign and the leadership could apparently present a united picture and was more on the offensive.

In its campaign, the Left Front stressed Rajiv Gandhi's remark about Calcutta being a 'dying city' and called upon the citizens to give a fitting reply to the insult to the people of Calcutta by the Congress(I) Prime Minister by electing Left Front candidates. It also dwelt upon the discrimination of the Centre against Calcutta and West Bengal. Civic issues were relegated to the background. In the manifesto published by the Left Front the programme for improvement of civic services was set out in very vague terms. The Congress(I) also attacked the CPI(M)-led Left Front for the deteriorating conditions of city life—the problems of load-shedding and transport and the poor conditions of civic services. The campaigns either by the Left Front or the Congress(I) did not create much enthusiasm among the citizens. Generally, they did not place much confidence either in the Left Front or in the Congress(I) for running civic administration in a better way so as to effect much improvement in civic services.

This was not fortuitous and tallied with the experience of Calcutta citizens. The Calcutta Corporation was run by the Congress Party since 1924 till Independence. After Independence, the Congress Party was responsible for running the civic administration from 1952 to 1969. During this long period of Congress rule, the Corporation earned notoriety for maladministration, nepotism and corruption. The UF administered the Corporation from 1969 to 1972 and the Corporation has been in the direct control of the Left Front government from 1977 to 1985. Though civic workers and employees earned important economic concessions during this period, civic services showed no remarkable improvement. There was, of course, marked improvement in filtered water supply and improvement in the bustees were effected by the Calcutta Metropolitan Development Authority. But conservancy services or the drainage system showed little improvement. Often the piled-up garbage is removed at the personal initiative of the minister-in-charge. The people of Calcutta have suffered from bad condition of civic services. Nepotism and corruption were not curbed during this period. Moreover, the bureaucratic set-up of the civic administration was much strengthened during this period. Even on the eve of elections, this process continued. But there was little improvement in work. All these factors harmed the cause of the Left Front. So Calcutta people did not expect either the Left Front or the Congress(I) to alleviate their sufferings by improving the civic services. As the voters in West Bengal are polarised, the people of Calcutta voted according to their political loyalty. It was thought that local issues would influence the Calcutta voters, but this was not the case in the recent civic election.

Though official figures have not yet been published, it is reported that 50 per cent of the total of 25 lakh voters cast their votes. Considering the inclement weather on the polling day and lack of any extra enthusiasm on the part of the people, the voting percentage was not insignificant. It has been reported in one daily newspaper that in the 141 Wards, the Left Front got 6,12,552 votes while the Congress(I) polled 6,31,021 votes, that is, the Congress(I) polled about 18,000 more votes than the Left Front. Another daily reported that the Congress(I) polled 5,95,410 votes while the Left Front polled 5,83,040 votes. In any case, the Congress(I) polled more votes. But in the 1984 Lok Sabha elections, the Congress(I) had polled three lakh votes more than the Left Front. The Left Front Chairman Saroj Mukherjee has claimed that as the CPI(M) took lessons from the Lok Sabha elections, it has been able to correct its mistakes and has oriented its work in the interests of poor and middle class people who have supported the Left Front in the civic elections. How far this claim is justified is yet to be seen. From the pattern of votes in different Wards, certain general conclusions can be drawn. The CPI(M) and the Left Front regained their position in the areas inhabited predominantly by the refugee population which have been a traditional stronghold of the communists. This position had been lost in the last Lok Sabha elections; but in the civic elections, the Left Front won all the 14 seats. The majority of 'bustee' people also generally voted in favour of the Left Front. In the predominantly Hindi speaking areas, the Left Front lost heavily as was expected. But in many of the predominantly Muslim areas also the Left Front lost. This feature was also seen in the last Lok Sabha elections. A considerable section of the Muslim minority has moved away from the Left Front. In the areas predominantly inhabited by traditional "Calcuttans", in central and north Calcutta and even south Calcutta, the Left Front fared badly. Many erstwhile UF councillors who were supported by the Left Front suffered defeat. Not only the upper middle class but a section of the middle class also continue to stay away from the Left Front which has to probe deeply into the causes of this. Particular attention has to be paid to the Muslims.

The prospect of better civic administration and better civic services is very bleak. The Left Front faces a tough job with such a slender majority. The Congress(I) is likely to create disturbances inside and outside the civic body. Moreover, there is the chronic problem of finances of the Calcutta Municipal Corporation.

Structural changes like the constitution of the Mayor-in-Council notwithstanding, there has been little enlargement of the powers of the Calcutta Municipal Corporation since its formation in the mid-twenties. Its powers do not extend beyond conservancy services, etc, and resources are drawn almost exclusively from the Municipal rates on houses. The Calcutta Metroplitan Development Authority is entrusted with developmental work and controls huge finances, but the elected representatives have no control over the CMDA. Besides the Calcutta Municipal Corporation, many other agencies such as CMDA, CIT (Calcutta Improvement Trust) and CMWSA (Calcutta Metropolitan Water and Sanitation Authority) work in the city area towards providing civic services. The problem of co-ordination and defining areas of work has not been solved. All these problems have to be tackled for betterment of civic services. So the civic election on the basis of 1980 Act has not opened any bright prospect for the city people. The Left Front has to ensure the active co-operation of the city people as well as of the civic workmen in order to effect any improvement in civic services.

## ANDHRA PRADESH

# Who Cares about Academic Autonomy?

**M Shatrugna**

THE promulgation of the Andhra Pradesh University Acts (Amendment) Ordinance 1985 on June 10 exposes not only the growing bureaucratic control of the university bodies by state government but also the pliant academic community in the state. The Ordinance, covering seven universities, restructures the university syndicates, doing away with the system of election of members. As per the Ordinance there will be nine members, seven directly nominated and the other two nominated according to seniority from among professors and principals of affiliated colleges in the university area. Whereas the Vice-Chancellor and the government representatives are called Class I category, the rest are called Class II. Out of the five Class II members, three will be educationists belonging to the university area. Earlier each university had its own set-up. For instance, the Osmania University had 19 members in its Syndicate—six nominated by the government and the rest elected from the Senate (4), Academic Council (4), the Legislative Assembly (3), and the Council (2).

On the face of it, the Ordinance has not significantly changed the system of 'election', as the other organs of the Universities, *viz*, the Senate and the Academic Council, have not been touched. One can still hope that while restructuring these two bodies enough provision would be made for election of members from these bodies to the Syndicate suitably amending the present Ordinance. But what is surprising is the manner in which the Ordinance was pushed through. The Education Minister while releasing copies of the Ordinance told the press that the restructuring was based after the recommendations of the Central Universities Committee under the chairmanship of Madhuri Shah and Vice-Chancellors' Conference of October 1983. The Madhuri Shah Committee's recommendations were meant for Central Universities. In any case such important decisions affecting the autonomy of the universities should not have been left to the Vice-Chancellors alone to decide. In the present case, neither the university teachers' associations nor the academic community in general was consulted. Also the Ordinance has certain peculiarities. Generally an Ordinance or a Bill is issued with certain 'aims and objects'. No such statement appears in the present case. As a former Law Secretary to the government confided, the present practice is not to mention any aims and objects as in many instances the provisions of the ordinances have been found contrary to the stated aims and objects by the law courts.

Surprisingly, there has been no concerted protest on the issue by the academic community. One possible explanation may be the highly hierarchical set-up of the universities and the pliant nature of the teachers. The universities in the state, especially after Independence, have no history of struggles to uphold democratic values and autonomy. Even the so-called 'autonomy struggle' in Osmania University under D S Reddy during the regime of K Brahmananda Reddy in the sixties was in effect meant for the autonomy of the Vice-Chancellor rather than the university as such. D S Reddy and those who followed him, barring one, were more interested in their own autonomy than in extending democratic values at all levels of the administration. In the name of autonomy, autocracy was practised in the Osmania University during the Emergency. The teaching community was no better. When a number of student political activists were arrested, detained and in some cases even murdered in so-called 'encounters' by the state, there had been no protest of any kind by the academic community. When a number of teachers were detained under MISA and kept in jails for long periods of time, there was again no protest. Even in the present case, barring some press statements condemning the Ordinance there has been no active protest from the teaching community. In fact some teachers have already become accomplices in this government-sponsored arrangements. The government has nominated nine 'educationists' to the Syndicates of the Osmania, Andhra and S V Universities under the Class II quota. All of them are senior professors, but not one of them has thought it fit to uphold academic autonomy and democratic values by rejecting the government offer. With such a track record of commitment to democratic values, not much of a fight against the undemocratic Ordinance is to be expected from the academic community.

## BANGLADESH

# Civil and Military: False Dichotomy

### Badruddin Umar

SINCE March 1, 1985 open or legal political activities have been very severely restricted in this country. In any country, this kind of political restriction is indicative of a crisis not only in the camp of the bourgeois constitutional opposition but in the entire social, economic, administrative and political relations obtaining in the country. This crisis inevitably reflects itself in all spheres of life in the form of anarchy and with the worsening of the crisis the anarchy increases with a certain ferocity and tends to go beyond the control of the powers that be. Bangladesh is no exception in this regard.

Whatever may be the type of government, there is no Chinese wall between the civil and the military in it. In running the economic system, the administration, etc, and in maintaining law and order they work hand in hand and promote the same objectives. This is clearly demonstrated when a so-called democracy succumbs and is replaced by a military government.

In order to create a smokescreen and hoodwink the people, bourgeois theoreticians, bourgeois political propagandists and the bourgeois propaganda media, including the press, try to portray the changeover from the civil to the military administration as a qualitative change in the existing system. The constitutional opposition sheds tears for the 'good old days' when an exploitative system could be smoothly run with the 'consent' of the working people themselves. They are not really against the basic system itself, not against the ruthless exploitation of the workers, peasants and other working people. Their objections are against the methods employed and their bourgeois sensibility is averse to its nakedness. So they pine for constitutional clothing and for the sweet satisfaction of doing what they do with the so-called consent of the people.

The military—the army, the navy and the air force—does not constitute a class by itself. But that does not mean that it is classless. It simply means that the class character of the military in a certain country is most decisively determined by the socio-economic system obtaining in that country. And being a part and parcel of the system itself it always protects and promotes the same kind of basic interests which are protected and promoted by the civilians, the elected 'representatives of the people'.

Thus the military is called by civilian governments whenever they face a serious crisis, a crisis which cannot be met with civilian instruments of control. This is just the beginning of the military's role as the saviour. The role gradually enlarges and covers new areas with the development of the bourgeois crisis and finally leads to the military takeover of the administration and the government. In developed and well-organised capitalist countries the process develops slowly and imperceptibly until the crisis becomes acute. But in the less developed and backward countries this movement is rather fast. Thus, in the latter countries, the transition from civilian to military rule takes place within a comparatively short span of time.

If we remember this basic law of development then it will be clear to us that the civilian government in Bangladesh was overthrown and replaced by a military government not just because one evil-doing general or the other chose to overthrow the legally constituted government and assume control of the reins of power. In fact, owing to various reasons, into which we cannot enter here, a very serious economic and political crisis began to develop and mature in this country after 1972 and finally it reached a stage where, in order to save the system, a military takeover became a necessity. To meet this necessity the bourgeois system threw up its own instruments and the military leaders made their appearance openly on the political scene.

Being thus installed in power the military rulers recited the usual formula of returning power to the civilians as soon as it was possible and undertook all the measures which they considered necessary in order to save the system and protect the basic interests of the civilian 'lovers of freedom' and democracy. In Bangladesh this is more true than in most other countries similarly placed and that is the reason why, even today, the bond between the bourgeois constitutional political opposition and the armed forces is quite strong.

Two consequences follow from this. First, in a situation like this the bourgeois opposition fails to place before the people any kind of concrete economic and political programme which can really enthuse and arouse them for any decisive political action. Secondly, in order to hoodwink the people both the civilian and military elements enter into secret negotiations with each other and come to conspiratorial agreements, the exact nature of which is determined by the situation actually obtaining at various stages.

Those who really want a radical transformation of the whole society operate outside the constitutional framework. But those who are basically committed to the present system either by self or class interest or ideologically, have practically nothing else to do than what has been mentioned above. Thus the political climate in which the bourgeoisie in Bangladesh find themselves is determined by their class character and their activities, both of the right and the so-called left, lead them fast towards the destruction of their political position and create conditions for the growth and development of new and other forces.

---

## Larsen and Toubro

LARSEN AND TOUBRO has declared an interim dividend of 12 per cent for the year ending September 1985 to equity shareholders whose names are registered in the books of the company on August 17, 1985. The shares allotted during the year on a 'rights' basis will be entitled to proportionate dividend. The company's register of members will be closed from August 6 to 17, both days inclusive, for this purpose. The dividend will be payable on or after August 31, 1985.

# Piloting a Nation into the Twenty-First Century

## Changing Political Context of State Power and Class Contradictions in India

### T V Sathyamurthy

## I

INDIRA GANDHI's assassination, the eighth Lok Sabha election, the March 1985 elections to the Legislative Assemblies of States* covering well over half of the total population of the country, and the budget—taken together—provide interesting clues to an understanding of the dynamic forces at play during an important phase in the development of state power in post-colonial India. The six-month period between November 1984 and April 1985—like the Emergency and the 1964-66 interregnum between the end of the Nehru era and the beginning of Indira Gandhi's Prime Ministership—represents a watershed in Indian politics, and points to the emergence of new conflicts involving dominant classes.

Under Nehru, a comparatively new state structure which underwent a slow process of elaboration nevertheless acquired the capacity to overcome instability caused by communal strife, suppress the Telengana insurrection, and cope with (or contain by the application of brute force, as the case may be) the demands of different nationalities based on claims of linguistic, cultural, regional or ethnic identities. Along the frontier (and especially in the Punjab, Jammu and Kashmir, and the Nagaland area) popular forces laying claim to a certain measure of local autonomy and democracy were firmly lidded down. In doing so, the Indian state laboured under the assumption that such local assertions of identity could only be regarded as being fuelled by centrifugal tendencies which, unless firmly put down, would eventually lead to demands for self-determination and pose a threat to the integrity and security of India.

The left wing parties, for their part, were of little help because they wavered between the two extremes of support for a centrist orientation to nationalism *a la* the Congress on the one hand, and on the other, the nationality based demands of certain regions of the country. However, the main political point to make about the Indian state under the aegis of Nehru's Prime Ministership is that its resilience bore no systematic relationship to its actual power.

On the economic front, ample opportunity was provided through planning for the creation of conditions favourable to a guided growth of agriculture which would eventually provide the surplus needed for rapid industrialisation and the establishment of an essentially capitalist economy, drawing material support from an expanding and highly ramified state sector.

In the process, a class of rich peasantry and middle peasantry representing economic interests of a specific nature emerged with its *loci* of power and political bases spread out in the various States or regions, especially in the north, the north-west and the west. In course of time, divergences of class interests between the industrial and agricultural segments of the national bourgeoisie came to be expressed increasingly in the form of radical differences in outlook (in secular terms) on crucial issues between the Central government and the State governments. This was often dramatised by the fact of the two sides being ruled by parties (or coalitions) in opposition.

Shastri's rule represented the first interlude during which the Centre appeared to take the political role and significance of Indian agriculture (i e, the rural class of 'haves') rather more seriously than had been the case during the initial phases of the Green Revolution. Quite how the Central government would have shaped and controlled the power of the Indian state, had Shastri lived long enough to consolidate his position and pursue policies consonant with the ideological strands in the Congress party which he represented, is difficult to guess. But there can be little doubt that, during his brief regime, the potential power of a rising agricultural bourgeoisie in India as a political and economic force in its own right was recognised for the first time. The fact that India was still far from being self-sufficient in food production, however, ran counter to any effective role that this rising class could play *sui generis* in determining the overall balance of class forces which underpinned state power at that particular stage of India's post-colonial history.

It was under Indira Gandhi's Prime Ministership that the physical apparatus of state power was developed to an unprecedented extent. The might of the state as a centralising force and as an instrument for reflecting the interests of the ruling classes was consciously developed. On the one hand, India witnessed the elaboration of the state and the fashioning of a basically chauvinist ideology which saw threats to Indian sovereignty, and national integrity and autonomy, in almost all demands of a popular character for local autonomy and a better deal from the Central government. On the other, Indira Gandhi and her supporters developed populist slogans (especially after the nationalisation of the fourteen banks in 1969 which, given its precise political context, should be regarded as an accidental happening rather than as part of a seriously conceived pro-people policy in the economic sphere) which further reduced the 'socialist pattern of society' to a series of cruel shibboleths.

In the face of the stout resistance offered by the newly emergent classes in the agricultural sector to any constriction of their interests by the state, lip service to socialism became a convenient facade behind which a vigorous policy running counter to the interests of the working classes (in industry as well as in agriculture) could be mounted in order to squeeze more and more surplus from labour. The ruthless manner in which the railway general strike was suppressed and the general anti-worker orientation of the 1975-1977 Emergency represented the crucial features of the dynamic of state power as it was developed during Indira Gandhi's first term of office (1966-1977).

## II

In unveiling the Indian state with its enormous power to suppress dissent, oppress 'subaltern' classes, and generally repress the population as a whole, with the declaration of Emergency in 1975, the ruling classes and their political representatives had completely underestimated the powerful roots that popular consciousness of basic democratic and civil rights had sunk in the country as a whole, and the widespread awareness of the advantages of a genuinely parliamentary system of government.

No wonder then that the Indian electorate seized the earliest opportunity to throw the Congress party out of power, and elect, in its place, a more polyglot conglomeration of political forces representing (though in unequal and irregular measure) divergent class forces. That the Janata broke up and degenerated into a shambles within a very short period is far less important than the fact that it was during the post-Emergency period and not during the Emergency that parliamentary democracy (of a kind) was indeed 'put back on its rails'.

Furthermore, puissant as the Indian state continued to be after the Emergency, its vulnerabilities in three areas stood exposed under the Janata. First, in the arena of Centre-State relations, a perceptible shift began to develop in the balance of power between the class interests represented in the main by the party in control of the power of the Indian state on the one hand, and, on the other, the interests of the locally dominant classes (the petit-bourgeoisie which may or may not be a producing class; the regional industrial bourgeoisie consisting of medium and small scale industrialists engaged in production exclusively with local capital; or/and the rich and middle peasantry and their allies, as the case may be).

---

* The term 'State' is used in this essay to refer to States of the Indian Union. The term 'state' is used to refer to the Indian state.

The intimations of such re-alignments of class power were originally manifested as early as 1967, but the anti-Congress coalitions which came to power that year in eight states (including the two United Front coalitions led by CPI-M) were extremely vulnerable to de-stabilisation by the Centre. In 1977, however, despite the strongly 'centralist' ideological orientation of the new Prime Minister where Centre-State relations were concerned, opposition political parties in power (including, ironically, the Congress party which continued to dominate Andhra Pradesh and Karnataka) in the various States were, politically speaking, no longer on the defensive.

The assertiveness with which the ruling parties or coalitions in the States raised demands for a greater devolution of economic (i e, financial) and political power reflected the tensions and contradictions, that had been in the process of unfolding for well over a decade, between the Indian national bourgeoisie (representing the interests or claiming to represent the interests of all segments of the Indian ruling class) as a whole on the one hand, and, on the other, the dominant segments within it centred in the regions and providing the political support needed by established parties in executive control of the various State governments.

By adopting a flexible approach to problems posed by the calculus of class power within their jurisdiction, even the Left Front governments in the eastern part of the country have demonstrated a remarkable degree of resilience and adaptability to parliamentary government essential for their continued survival in power. That this expertise in the art of juggling contradictory interests has had to be gained at the expense of at least some of the main pro-people commitments which, in the first place, impelled them to seek parliamentary power before ploughing the revolutionary furrow is another matter which merits a separate discussion. In the context of this discussion, however, it would be useful to note that even although the case for relative autonomy of the State *vis-a-vis* the Centre was originally voiced in a forceful manner by populist and left parties (DMK since 1967; and CPI-M, especially since 1977), the scope and compass within which they located their main demands turned out to be somewhat narrow and specific.

Thus, the main elements in their campaign for autonomy related to a more equitable distribution of power between the Centre and the States which would enable the latter to acquire greater access to financial and other resources for development. Conflict between the Centre and the States became tame enough and tended to cover familiar ground. Neither side had any need to fear the other, even though a war of attrition was resumed once Indira Gandhi returned to power.

Much more complex than these divergences between the Centre and the States were the problems that came to the fore during the Janata phase specifically relating to Assam and the Punjab. Though neither of these assumed serious proportions until after Indira Gandhi took power in 1980, the issues exemplified in these two cases are not without more general relevance extending to other regions (especially on the periphery—e g, Jammu and Kashmir; Sikkim; and the North-eastern States in general).

In both cases, it was not a political party at the State level that was at odds with the Centre (in the Punjab the Akali Dal was actually in power until it was dismissed by Indira Gandhi in 1980); but rather, a popular multi-class movement based in the mass of the people and led by powerful local classes (the producing Sikh peasantry in the case of the Punjab, and the non-producing Assamese petit-bourgeois elite in the case of the Assam student agitation against 'the foreigners'). These movements were poised to capture executive power from hitherto dominant political parties which represented the interests of other classes and were subservient to the Centre.

Thus, to an ever greater extent than the DMK agitation of the late 50s and mid-60s, the Assam agitation touched upon issues of a fundamental nature, regarded as sacrosanct by the Centre, such as, for example, whether the State or the Centre (in view of the fact that the Assam movement was not in power, this should be read as 'whether a democratic movement in the State or the Centre') had the competence to define the criteria to be applied in determining who may or may not be included in the electoral rolls of the State.

The 'mass democratic' aspect of the movement as evidenced in its capacity to sustain committed support throughout Assam for over three years served two purposes—*viz*, a sharpening of the line of cleavage between the Centre and the State by bringing into dispute matters which had hitherto been universally assumed to be within the domain of the Centre; and an ungulfing of the entire State in demands raised by a mass movement, rather than the usual pattern of political parties opposed to the party in power at the Centre challenging the latter's interpretation of different provisions of the Constitution which adversely affect the development of the State.

Furthermore, in the case of Assam, the introduction of explicitly 'nationality' based demands of the Assamese people (as distinguished from the dominant Bengali *bhadralok* interloper class, the new influx of poor Bangladeshi immigrants occupying and exercising individual tenancy or even proprietary rights over 'Assamese' land, and the tribal population of the State) has evoked the predictable response from the Centre to the effect that it would not yield to such threats to 'national integrity' (allegedly 'foreign inspired', for good measure!).

In fact, however, national integrity as perceived by the Indian ruling class has not in any way been threatened either in the Punjab or in the Assam agitation because the 'mass' character of both movements is superficial by comparison with their 'class' character. In both cases, a restive locally powerful class began, during the Janata regime, a political process by which it hoped to seek an accommodation with the Centre which would permit it to exercise greater power at the State level.

Second, during the Janata regime, for the first time at the national level since independence, those specifically representing the interests of the rising agricultural bourgeois class exercised state power alongside the representatives of the other (and, of course, particularly the industrial bourgeois) segments of the ruling class. In fact, behind the ugly scenes that led to the toppling of the fragile Janata coalition in 1979 lay much more than the political amibition of an ageing *neta*.

The rich peasant interests which had obtained a recognised status in the grid fuelling the power of the Indian state sought, *albeit* prematurely as it turned out, to stage a sort of 'internal coup' by which it was hoped that they would assume a position of dominance within the ruling class as a whole. Indira Gandhi's brilliant manoeuvres, first to prop up a coalition led by rich peasant interests and then to smash it unceremoniously in Parliament within a fortnight of its assuming power, constitute the beginning and end of a brief but dramatic chapter—one with a portent for the future—in the history of Independent India.

The terms of trade between agriculture and industry had indeed shifted considerably during the 70s; but the shift was by no means of such a magnitude as to signal the dominance of agriculture over industry, Indira Gandhi's return to power was, therefore, marked by the emergence of the agricultural bourgeoisie as a political force of no inconsiderable importance, as yet still in no position to control the commanding heights of state power, but which it would be sheer folly for whichever political party was actually in control of state power to ignore. The increased political restiveness, throughout Indira Gandhi's second stint in power, of a number of State governments [not limited only to those governed by parties of the opposition, but also including such important Congress(I) ruled States as Maharashtra] should be viewed as a reminder that the agricultural bourgeoisie of India—whatever their national future in the short run—have come to stay at the State level as a dominant class force.

Third, by virtue of its very disparateness, the Janata coalition was well placed to make a substantial departure in the field of industrial policy crucial to the interests of the Indian national bourgeoisie. During the period 1972-77, Indira Gandhi had already initiated a significant move away from the pattern of thinking about development generally accepted in India. The Indian state had made substantial progress in the field of heavy industry which was placed at the disposal of the Indian capitalist class for the development of private enterprise. There was not much more that the state could do for the national bourgeoisie.

Yet, there were limits to the extent to which a populist Prime Minister, nurtured in the rhetoric of shibboleth socialism, could afford to be seen to break the mould of 'mixed enterprise' thinking in which Indian planning and development had become enmeshed. The Janata regime, however, was relatively free of the burden of commitment to some form of 'socialism'. Characteristically, it took the initiative to open up Indian industry to powerful thrusts of foreign capital under the guidance of George Fernandes, the 'socialist' Industries Minister.

The underlying logic of this new approach was fairly straightforward. The Indian national bourgeoisie, relative to its size and capacity, was starved of the capital necessary for the full development of productive forces appropriate for establishing, on a secure footing, capitalist relations of production in the Indian economy. A good proportion of its economic activity was still located in the commercial sector which was thriving with the expansion of the internal market and the purchasing capacity of the topmost layer consisting roughly of 15 to 20 per cent of the total population which itself has undergone a rapid process of internal differentiation.

Even although this represented a robust picture of the emerging profile of the economy in one sense, an expanding commercial or market economy could be no substitute for a fully developed capitalist economy that produced (both for internal consumption and competitive export) enough, while at the same time expanding its base. To be sure, a rising proportion of savings in the agricultural sector was finding its way into investment in some parts of the industrial sector, but, by and large, the agricultural bourgeoisie could not be prevailed upon by the state, against their will (so to say), to part with any of their surplus for industrial development.

Industrial and rural labour of course continued to be squeezed through draconian legislation as well as by other means of coercion including the pressure generated by the feudal practices that have persisted in certain sectors of the agricultural economy. In other words, the task of firing the engines of capitalism of the gigantic but nevertheless dependent Indian economy would inevitably require a substantial participation of foreign capital.

Janata was in a good position to prepare the way precisely for such a development. Just as in the sphere of restoring parliamentary democracy and bourgeois civil liberties, so too in the sphere of opening Indian enterprise to foreign collaboration in a number of fields, the Janata government played a notable role. But, whereas Janata's contribution in the political sphere was on the whole positive, its policies in the economic sphere led to a stoking of the inherent contradictions of the Indian economy.

When Indira Gandhi took re-possession in 1980 of what she had always regarded as her legacy, she was quite happy to continue and develop India's economic policy along the trail that the Janata government had blazed before her. At the same time, she felt powerless to reverse the democratic political trends set in the country as a consequence of the re-emergence of self-confidence among different (and especially the relatively deprived) segments of the ruling class and its supporters among the petit-bourgeoisie and the intelligentsia (as well as organised labour) during the 1977-1980 interregnum.

Thus it was that during her second whack in office, Indira Gandhi could do little to stifle the democratic aspirations of the people despite the government's attempts to reintroduce the Emergency by the back-door. But, in her capacity as the chief political representative of the Indian national industrial bourgeoisie, she was well placed to build on Janata's policy of encouraging the process of furthering the integration of Indian capital and Indian industry into the world capitalist system. The Indian government's dramatic decision in 1981 to go to the IMF with the aim of securing Special Drawing Rights to the tune of over US dollars 5 million represented a Great Leap Forward in this direction.

When Indira Gandhi's regime came to an end, the Indian state had already begun to achieve notable success in its efforts to open the door of the Indian economy, to a substantial degree, for penetration by foreign capital. At the same time, the contradiction between the industrial bourgeoisie on the one hand, and on the other, not only the agricultural bourgeoisie but also regional bourgeois forces with their base in small and medium industry fuelled by indigenous capital, had further intensified. The difficulties that Indira Gandhi's government experienced in the field of Centre-State relations in different parts of the country were in good part traceable to the political manifestations of these contradictions.

## III

The events of the last few months, viewed in the light of this general perspective, would appear to have imparted fresh momentum to the changes discussed in the previous section. The fact that Indira Gandhi's assassins were Sikhs was used as a pretext by the ruling party to step up a propaganda campaign in which the threat to 'national integrity and security' stemming from the Punjab issue was exaggerated to the point of provoking a flood of mass hysteria. Seizing the opportunity provided by a recrudescence of Hindu communalism which, thanks to the stratagems of the ruling party, had already been under way for sometime (as witness the substance of the Congress(I) campaigns leading up to the Haryana State Assembly election of 1982, the Delhi Municipal election of 1983, and the constituencies of Jammu in the Jammu and Kashmir State Assembly election of 1983; as well as in the methods adopted to counter the Akali Dal agitation in the Punjab itself since 1982), ambitious and ruthless Congress(I) leaders provoked frenzy among lumpen elements which led to an orgy of orchestrated violence which was focused upon the poor and exposed sections of the Sikh community in Delhi as well as other cities.

While the tough elements in the ruling party indulged their thirst for communal blood in this fashion, the party as a whole decided to go to the country amid the unsettled conditions following the assassination. Under the circumstances, the electorate was called upon to exercise its choice not on the basis of alternative policies placed before it, but rather on the ground that only the ruling party with a massive mandate could save India from disintegration and Balkanisation.

By any criteria, it was an extraordinary election campaign in which opposition parties were indiscriminately attacked as traitorous to the cause of India's unity and national integrity and the electorate subjected to high pressure media and advertisement tactics unsurpassed in the history of parliamentary democracy. That the opposition was confused and out-manoeuvred from the outset of the campaign and produced no credible or convincing alternative policy did of course result in the jingoism and chauvinism of the ruling party going unchecked.

In the event, the Indian electorate delivered a verdict in the Eighth Lok Sabha election which, digital gymnastics of psephologists notwithstanding, represented on balance a total rejection of an Opposition which insisted on being in an almost terminal condition of chaos and disorganisation rather than an enthusiastic endorsement of the new regime. Once again the electorate had acted with prudence and intelligence, *albeit* in the opposite direction, nearly eight years after it had taught the ruling party an unforgettable lesson.

The main significance of the victory of Congress(I) in the Lok Sabha elections under Rajiv Gandhi's leadership lies in the fact that the rhetoric of forging ahead into the twenty-first century will be increasingly used to justify inegalitarian policies and repression of popular democratic forces. It also means that, even within the general mandate of delivering the political and economic goods to the ruling class, priority will be given to expanding the capacity and increasing the resilience of industrial capital, while at the same time creating conditions for its uninterrupted reproduction in order to achieve—as far as practicable—*fully* capitalist relations of production.

Conditions are already being created for increasing the dependence of Indian capital on international and multinational capital. At the same time, the needs of the agricultural bourgeoisie, which is committed to a general policy of modernisation, expansion of its productive base, and a more rapid reproduction of capital in its sphere—all with the continued aid of the state—will not (and indeed cannot) be given the same amount of importance as those of the industrial bourgeoisie.

It is a characteristic feature of the Indian ruling class that in the long run agricultural and industrial capital cannot expand simultaneously (within an indigenous framework). Each segment of the ruling class would inevitably view the preponderent development of the other as taking place at its own expense. In recent years, this trend has been increasingly discernible as has already been pointed out in a previous section.

Dependent capitalist development in a climate characterised by acutely uneven conditions of development of production relations cannot, in the long run, take place without eventually provoking conflicts within the ruling class or transforming already existing intra-ruling class conflicts from a non-antagonistic to an antagonistic state. Thus, the exultation with which all sections of industry (except, it must be noted, small scale industries which are not adjuncts of or ancillary to big industries, and some medium scale industries) have hailed the Indian government's recent Budget should come as no surprise. But, in adopting Rajiv Gandhi as its most favourite candidate to date for piloting the ship of state into the future, the industrial bourgeoisie of India may have been prematurely confident of the potential for growth inherent in Indian capital and its own capacity to withstand, even with the help of state power, the vigorous onslaught of the rural rich that is bound to follow sooner than might now be anticipated.

This trend is nowhere better exemplified than in the results of the recent elections to 10 State Assemblies comprising well over 50 per cent of the Indian electorate. In Karnataka, the Prime Minister conducted an election campaign no less sweeping in its condemnation of the Opposition than in the Lok Sabha election, in the course of which he even stooped so low as to declare that the electorates of Karnataka and Andhra Pradesh should remember that it was only at their own peril that they would envisage returning an Opposition government to power in the State when Congress(I) was in power at the Centre.

Rajiv Gandhi's strategy backfired to a degree far in excess of Janata's hopes. Both in Andhra Pradesh and Karnataka, the disgruntlement of local elites (predominantly rural in character), laced with popular support for 'democratic' values (in the given context), led to an election result well worth pondering over for its wider significance.

In Uttar Pradesh and Bihar, the Dalit Mazdoor Kisan Party (DMKP)—with its leadership split in the two States between Chowdhury Charan Singh and Karpoori Thakur—emerged as a substantial force on the opposition benches. Given the fact that for various exigential reasons, rich and middle peasant voters also supported several Congress(I) candidates, it would be reasonable to suggest that in these two State Legislative Assemblies there exists a real potential for splits from Congress(I) if a sufficient number of legislatures of both the ruling and the opposition parties were to feel aggrieved and see in specific policies put forward by the State government a threat to the interests of the agricultural bourgoisie as a whole.

In UP in particular, it would be reasonable to assume that each of the 92 MLAs belonging to DMKP (once again re-named Lok Dal or LD) is matched by his or her counterpart on the ruling party benches representing more or less identical economic interests. In the more complicated cases of Rajasthan and Madhya Pradesh, the same general reasoning would apply, despite the comparatively less secure position of Congress(I) in the former and its apparently more secure position in the latter.

In contrast to the 'heartland' States, where the alignments in the new State Assemblies are subject to conjecture and not yet entirely clear, Maharashtra offers itself as an example of a State in which the conflict between powerful agrarian interests present in the State Assembly on the one hand, and on the other the State government either in conjunction with the Central government (or even beleagured as a consequence of opposing certain policies of the latter inimical to the interests of the rich and middle peasantry in Maharashtra) or by itself, could come to a head in a year or two.

Here the People's Democratic Front (PDF) coalition has already focused on specific issues on which it intends to keep up pressure on the government. Its ominous campaign for crop protection insurance by the State and better procurement prices for jowar and cotton has already acquired sufficient momentum to force Chief Minister Vasantdada Patil to placate the opposition to the extent of prevailing upon the Central government to go back on its declared intention of withdrawing subsidies for insurance. In so doing, Patil has even recalled a precedent by which Antulay, as Chief Minister, yielded to similar pressure from the opposition in 1980/1981 by going against the policy of the Central government when he decided to write off certain categories of loans outstanding to cultivators to the tune of over Rs 62 crore.

Torn in its loyalities between the class on which it has so far depended for electoral support in the formation of the State government on the one hand, and on the other the Central government under the control of Congress(I), the ruling party in Maharashtra might well be subjected to a tightening squeeze between an increasingly strident PDF and a less and less accommodating Central government. Such a prospect is all the more likely given the fact that the Central government, in view of its overall class direction under Rajiv Gandhi's Prime Ministership, might well prove to be less and less in a mood to go back on its general policies in order to rescue its own party in the State. Thus, despite anti-defection laws and transparent threats to potential political defectors from the ruling party, there is every possibility that, within the life of the present Assembly, PDF might well engineer a successful coup by provoking group defections from the Congress(I) government to an extent sufficient to bring it down. The time limit of one year that Sharad Pawar has set his coalition for achieving such a result may seem optimistic but, given the emerging configuration of class forces in Maharashtra as reflected in the State Assembly, the aim itself can hardly be regarded as unrealistic.

These developments, despite specific differences of manifestation pertaining to individual States, are sufficient in themselves for those in control of state power to want to pause. Add to these the far more complicated questions posed by such sensitive States as the Punjab and Assam where the economic logic of protest is overlaid, at least for the time being, by a clearly augmented consciousness of cultural, communal, linguistic, jurisprudential and other forms of neglect on the part of the Indian state.

Such social and cultural aspects of their role accrue to these peoples as minorities or separate *nationalities* (not to be confused with 'nations'), and they can only be brought into the mainstream by taking cognisance of their susceptibilities which have been trampled upon by a stepping up of coercion on the part of the state apparatus.

The interim between the recent State Assembly elections and the Ninth Lok Sabha elections is thus going to be crucial to the unfolding of certain basic class contradictions in Indian society. It is pertinent to point out that, in the absence of a clear analysis of the class contradictions that are developing in our society, the left (and in particular the communist) parties have shown themselves to be increasingly unable to grasp the significance of the crisis in which India is being engulfed.

As a conclusion to this general perspective, one further aspect of potential class contradiction must be explored even if only in a tentative manner. Rajiv Gandhi is the only Prime Minister who may be said to be an anointed head of the government in the eyes of the Indian industrial bourgeoisie. The developing symbiotic relationship between the two is predicated upon the confidence reposed by the industrial bourgeoisie in the ruling party's capacity, under Rajiv Gandhi's leadership, to pilot it through rough weather (internationally in relation to world capital, and domestically in relation to agricultural and regionally located capital), and the Prime Minister's assessment that the Indian industrial bourgeoisie is ready for a breakthrough and take-off into the twenty-first century.

However, there is a real possibility that the mutual expections of the two sides, given the objective conditions, might well prove to profoundly misconceived. Even though Rajiv Gandhi is a faithful representative of the interests of the industrial bourgeoisie, his policies are not informed either by a familiarity with the Indian masses (all his predecessors, unlike him, had the advantage of some kind of populist relationship with the Indian masses) or by an analysis of the overall Indian situation of which the industrial bourgeoisie is but a part. This may mean that if the going gets rough, Rajiv Gandhi may well feel compelled to apply the emergency brakes on his time machine carrying us into the twenty-first century. Such an abrupt shift in policy would inevitably damage the interests of the industrial bourgeoisie.

At the same time, judging from his public statements, Rajiv Gandhi does not seem to have a grasp of how international capital operates. His policy of encouraging foreign investment is based on the assumption that it can be guided into new (e g, hi-tech) areas and prevented from coming into conflict with or dominating Indian private capital as a whole. He also seems to be under the misapprehension that different sections of foreign capital (which he seems to conceive as 'belonging' to different advanced capitalist countries!) can be played off one against the other, and the Indian state can indulge in a bit of 'dividing and controlling' in such a game. This has been clearly conveyed in recent statements to the effect that European (and especially Italian) capital would be more acceptable than American capital which is generally believed to be viewed with some degree of suspicion and mistrust! Needless to add, there could be no more profound misunderstanding of the international and multinational character of capital.

The consequences of such an economic world view on the part of the Prime Minister could be disastrous even for the hallowed relationship between the Indian state (as it is presently structured) and Indian industrial capital. The industrial bourgeoisie might well find it difficult to exercise a decisive say in the determination of the quantum and level of penetration of foreign capital in different segments of the industrial economy, mainly for the reason that it may not possess the clout that would be needed for imposing the necessary restrictions.

Under such circumstances, it would naturally expect the state to use its regulating power (which would have to be re-constituted at least in part after a period of phased decontrol and open invitation to foreign capital to enter different spheres of the Indian economy) to beat back an indiscriminate invasion of Indian industry b foreign capital in contradiction with the interests of Indian capital.

If, in the case of such an eventuality arising, the Indian state proves to be too weak to control, direct, and limit the penetration of foreign capital into Indian industry as a whole as well as in particular segments of it, a real crisis will emerge both for the state and for the prevailing pattern of class control of its still redoubtable power. Thus, even without the interposition of a full-scale intra-ruling class conflict between industrial and agricultural capital, there exists a real possibility that a powerful state such as that of India could be engulfed by the accumulated pressures of uneven and dependent development of capitalist relations of production.

Such a scenario may at first sight appear to be a foreboding of bleak prospects for the Indian masses and especially the working class in both the urban and rural areas. But, in actual fact, it is in the interstices of the conflicts among different segments of the ruling classes that we should look for opportunities for popular democratic movements to spread from one part of the country to another until they acquire a single subcontinental sweep. The failure of the ageing leaderships of the main communist parties of India to prepare for such a development constitutes a disappointing section of an otherwise intriguing chapter of contemporary Indian history that is now in the process of unfolding.

# Farewell to Modernisation?

**Krishna Kumar**

**Schooling and Modernity** by B L Jindal; Inter-India Publications, New Delhi; 1984, pp xii + 151; Rs 140.

THE 'modernisation' paradigm is still alive if not kicking. B L Jindal has used it to prove that schooling contributes to students' modernity, that the English-medium urban private school produces more modern students than does the government village school. By modern, he means the usual admixture of secular, scientific, achievement and independence-oriented, civic attitudes. After reading Jindal's elaborate analysis of students' scores on the modernity scale that he prepared to compare the students of two urban and one rural school in Hissar, Haryana, one is supposed to conclude that being modern in the prevailing social structure has to do with being born in a class whose children have access to locally prestigious, expensive, English-medium schooling. Put differently, modernity is a function of belonging to the local elite, and further that it has nothing to do with interest in changing the power distribution prevailing in society. But these are not the words which believers in the modernisation paradigm use. Nor does Jinal. He merely concludes that to spread modernity we should have more schools that are known to spread modernity—and these are 'quality' schools, invariably English-medium. To quote him, "the English medium has been found as a powerful predictor of student modernity".

It is a sad commentary on the modernisation paradigm that it has come full circle from being the mouthpiece of social change to becoming the legitimiser of elite style and power within less than thirty years. As Jindal's review of literature shows, the theoretical basis of modernisation was laid down in the sixties in the United States, and much of the empirical work, that is research aimed at showing the impact of education on modernisation, was done during the seventies, and in the 'developing' Third World. Thus, modernisation was the child of the 'development decade', born at a time when economic relationships brought about by colonialisation and modern imperialism had begun to be researched and needed something to be stopped from becoming a part of valid knowledge of the newly independent nations. Modernisation served this role. It persuasively insisted that being modern had to do with certain attitudes and values, rather than one's place in the social hierarchy, that education could bring about the desired change of attitudes, and finally, that the revolution of attitudes was what social change in the ex-colonies was all about. Thus, the concept of modernisation discouraged the young educated citizenry of the ex-colonies from perceiving social change as a process of redistribution of power and resources among different socio-economic strata. Modernity became, under the influence of the flying gurus of the sixties such as McLelland, Lerner and Weiner, synonymous with secular, scientific, achievement-oriented behaviour, a bag of virtues too pure to be defiled by political awareness of dirty things like power and oppression.

It is unfortunate that as a reviewer I should criticise Jindal's paradigm rather than review his work within it. One does this because the modernisation paradigm is far too politically allegorical to be taken at its face value. But once its message is clarified, which I had to do since Jindal didn't, one can 'accept' it as the proper context for commenting on a piece of research. Even if I do this, I fail to get excited with the data and interpretation presented in this study. There are far too many objectives and hypotheses—something that has become the trademark of Indian educational studies. What is worse, the data have been overexerted. After all, the kind of data Jindal is dealing with are hypothetical value-choices, not facts; not even opinions. For example, students are asked to respond to this statement: "man should live for today and his tomorrow takes care of itself". Whether one agrees, disagrees, or chooses to stay undecided about this proposition has to do with the way one relates to the meaning it conveys. Attitude questionnaires, unless very sensitively designed, take off from the shaky springboard of an assumed common interpretation on the part of the respondents. Once the researcher has made such a take off, he may find it impossible to remember the limited value of the data, especially in the midst of exciting statistical possibilities.

These possibilities Jindal fully exploits and one is not surprised that the over-analysed data bring him across odd fish that he must ignore. For example, his attempt to arrange urban students' score on the different dimensions of modernity according to their class-level at school shows that from Class 8 to 9 there is a decline in the scores on four out of the six dimensions of modernity. Table 4.12 shows that students of Class 9 are less—rather than more—secular, scientific universalistic, and achievement-oriented than students of Class 8. Jindal doesn't explain why more education causes reduction in modernity; he merely says that "Table 4.12 shows that the level of urban schooling was also positively associated with all the dimensions of modernity, except the secular orientation" (p 47). This reporting is clearly not accurate. One wishes the researcher had more respect for the data—whatever the kind and quality of the data he chooses to work with.

Jindal insists that his study has implications for policy. One implication he draws is that "there should be a ban on the haphazard growth of schools, and the high-ranking schools should get preference over the low-ranking schools". Obviously Jindal believes that no education is better than the meagre, poor-quality education that the less resourceful private schools or government schools can provide. Further, he believes that English-medium education available in urban areas is fine. Now if these are to be taken as conclusions arrived at on the basis of his study rather than his personal views, then we must once again see these conclusions in the context of modernisation as a paradigm of research in education. Here is a way of looking at the world that taught us all in our undergraduate days that literacy and education for everybody are essential in a democracy. Today, the same perspective allows one to conclude that since so much of educational effort (i e, village schools, Hindi-medium urban schools) does not lead to adequate modernisation of students' personality, we should now restrict education to the few who are capable of becoming modernised. The question that Jindal's study raises in one's mind is whether we should continue to see education in the context of modernisation, even now when the early promises of the paradigm have become irrelevant and the crises that modernisation-thinkers wanted to postpone have nearly engulfed us. Or, we should bury it with respect for what it was worth.

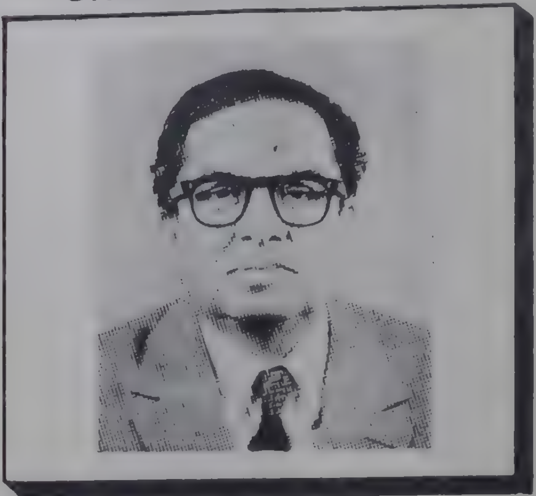
## Hero Honda Motors

HERO HONDA MOTORS released its first CD 100 motorcycle to its lucky recipient together with more than 100 others at a function in Bombay recently. The company takes pride that it has kept its promise to bring the latest technology to India within a record period of time. According to Brijmohan Lall, Chairman, CD 100 is technologically the most advanced motorcycle now available in the country. It is the only 4-stroke 100 CC motorcycle and is highly fuel-efficient capable of giving 80 kms per litre (40 kms per hour with 130 kgs pay load). The vehicle has been specially designed and developed to suit Indian roads and operating conditions. It is designed to give maximum rider comfort and safety and conforms to the highest international emission standards. The motorcycle is being produced at the modern factory complex set up by the company at Dharuhera in Haryana, a centrally notified backward area. While the company has a licensed capacity of 200,000 motorcycles per annum, the management has planned to produce 40,000 units in the first year and gradually increase the production to 120,000 units by the third year

# CHAIRMAN'S SPEECH.



**SHRI R.D. SHAH**

**Gentlemen,**

We pay our respectful homage to the late Prime Minister, Smt. Indira Gandhi whose tragic assassination was a great blow to the nation. Under the young and energetic leadership of the new Prime Minister, Shri Rajiv Gandhi,the country can look forward to achieving new peaks of economic progress.

The National economy recorded an impressive performance with a rise of 7% in industrial production during the first eight months of the year 1984-85 mainly due to growth in infra-structural industries which ensure basic inputs and services to the economy. Recent policy announcements by the Government of India relating to Import-Export policy, development of electronics industry, deregulation of licences for certain industries, raising of limit for MRTP companies and the reliefs in taxation would all go to accelerate the investment in industry. The new textile policy of Government of India is also expected to revive the textile industry, especially in the mills sector. This will have vital impact on the economy of Gujarat State which has a wide textile base.

The State of Gujarat, in its Silver Jubilee Year, fully utilised the Sixth Plan outlay of Rs. 3760 crores. The State was well on its way of achieving the growth rate of 5% during the Sixth Plan Period. The number of small scale units rose to 6,553 in the year 1984 as compared with 5,313 in 1983. Units registered in the large and medium scale sectors under DGTD were 148 in 1984 as against 96 in 1983.

The Silver Jubilee Year of the Corp
turned out to be an outstanding and e
one in the annals of the Corporation
end of 25 years, the total san
assistance of the Corporation has am
to Rs. 512.31 crores. Sanctions du
Sixth Plan Period amounted to Rs.
crores, indicating a rapid growth
Corporation's business during the past five years. Likewise, disbursements during the Sixth Plan Period were to the tune of Rs. 182.23 crores.

The Corporation has laid emphasis on achieving balanced regional development by extending greater financial assistance to industries coming up in backward and rural areas of the State. Total assistance in backward areas is to the tune of Rs. 245 crores to 9,893 units during 25 years, which is 47.8% of the total assistance.

The sanctions of the Corporation amounting to Rs. 65.42 crores in the year 1984-85 show a rise of 12.6% over the previous year. Disbursement (Rs.41.25 crores) also registered a rise of 7.6% over the previous year.The recovery amounted to Rs. 36.72 crores.

The Spot Guidance Programme init
1983 for guiding, helping and enco
entrepreneurs particularly in the sm
sector has received very enco
response. The Corporation cove
centres so far and has attracted abo
entrepreneurs wanting to ma
estimated investment of about
crores. A Counselling-cum-Guidanc
was specially organised at Bom
August 1984.

I am happy to report that a bill for amendment of the SFCs Act was introduced in the recently concluded session of Parliament proposing to enhance the limit of assistance from Rs. 30 lakhs to Rs. 60 lakhs and we expect to see a revised SFCs Act emerging in the next session of Parliament.

IDBI which contributes to a large extent to our resources appointed a Committee to examine the resource mix in the SFCs. The Committee has recommended certain vital changes whereby 55% of the disbursement will be met by refinance from IDBI; 25% from issue of bonds; and 20% through plough back and increased share capital.

**Computerisation.**

It is proposed to make the maximum use of the computer for providing all types of management information service. It is heartening to note that IDBI has also agreed to provide necessary support and financial assistance upto Rs. 5 lakhs to all SFCs and has also decided to appoint a Committee to evolve a standard package for computer hardware and software. I hope, as a result of these developments, the Corporation will have its own In-House Computer facility by the end of 1985-86.

**Seventh Five Year Plan**

In the light of far reaching changes made in the National economic and fiscal policies and emphasis placed on computerisation and utilisation of advanced technology, the country expects to make rapid industrial development. Gujarat will also go alongwith the mainstream of industrial progress and the Corporation has plans for acceleration of the process of development of industries in a significant manner in the Seventh Five Year Plan (1985-90).

On the occasion of the Silver Jubilee Year of the Corporation, when we have crossed sanction of loans of Rs. 500 crores, I acknowledge with a sense of gratitude the valuable contribution made by my predecessors, the former Directors and the Managing Directors whose able guidance and sustained efforts have helped the Corporation to achieve this position.

# The Making of Constitutional History

### Arun K Banerji

**Readings in the Constitutional History of India, 1757-1947** edited by S V Desika Char; Oxford University Press, Delhi, 1983; pp xcii + 789, including bibliography, notes and index; Rs 250.

DESIKA CHAR deserves our thanks for contributing this valuable addition to the historical material covering almost two centuries of constitutional development. For the benefit of graduate and post-graduate students and the general reader, he has presented in this book about 400 extracts from original records, official and unofficial, which in themselves are vast by any standards. According to the editor, the picture we have of the establishment of the British Empire in India is of an administrative structure developed to meet the needs of oceanic trade being gradually modified to suit the task of governing a big, growing empire; the creation and perfecting of a bureaucratic system based on absolutist principles and engrafting it on the democratic framework of the Government of England; the challenge posed after a time by the spread of democratic ideas and the nationalist upsurge resulting from British contact and the changes effected or sought to be effected to satisfy nationalist aspirations without loosening the imperial grip; and finally the bowing out when the task was found to be too hazardous and unrewarding. Since the documents (including also extracts from non-official sources) do not furnish an integrated picture, the introduction written by the editor is meant to help the reader to view the documents in the proper setting. In short, the volume is aimed at illustrating "the different facets of constitutional growth as a political scientist would view the problems". This objective is certainly met to a considerable degree in this book, covering almost 800 pages, with extensive notes, glossary, bibliography, etc. But political scientists of different hues are bound to find some omissions here and there, especially beginning with the late 19th century, the selection of readings from non-official sources. No selection of this nature can possibly satisfy everyone. Given this limitation, the volume succeeds in presenting a kaleidoscopic view of the chequered pace of constitutional developments. The more serious reader will obviously want to go deeper, for which he will be initially greatly helped by the bibliography which the editor has provided.

The selections are presented in seven parts, chronologically divided—1600-1757, 1757-1793, 1794-1833, 1833-1858, 1858-1917, 1917-1947 and 1939-1947. Four of these, the second to the fifth, have broadly comparable sections. Parts VI and VII deal respectively with 'Towards Responsible Government, 1917-47', and 'War, Pakistan Movement and Independence'. It is in these two, especially the latter, that one would have expected to see more material, covering not just public statements, plans, memoranda, etc, but extracts from unpublished sources, in particular, from the extensive two-way exchanges between the Viceroy and the Secretary of State. It is not that such material is not available. To have included it would have lent the work another dimension.

It is not easy to review a work of this nature encompassing development over a long period in many sectors, without unduly lengthening the review. A few items may be picked out. In the section dealing with the Home Government during the period 1794-1833, the dominant role of that government has been stressed unequivocally, as indeed has been done by the editor in his Introduction. But in the following section there is an extract from Macaulay, in which, mainly due to the time taken for a despatch from India to reach London and then for the response of the Board of Control to reach India, he stated emphatically that "it is utterly impossible that India can be really governed except in India . . . every measure of which history will hereafter make mention was taken without any authority whatever from home. I believe that every one of those measures or acts was regarded with disapprobation at home; yet none of them was rescinded or annulled, but every one of them was allowed to stand" (p 233). Only the mature student would be able to shift statements of this nature and those professing the contrary viewpoint and arrive at the 'truth'.

In Parts II, V and VI there are separate sections on the Indian States. Nevertheless their position is not very clear, as indeed is the case with the entire gamut of social, political and economic development in the States. Their history still waits to be written, except for the larger ones, and there too, during particular historical conjunctures. In the recent "Cambridge Economic History of India", Vol II, references to these States are only few, and no attempt has been made to link developments in British India with those in the States. Neither by population nor by geographical area do the States merit such neglect. In the book under review, one of the more useful pieces is an extract from Henry Prinsep's book ("Political and Military Transactions in India during the Administrations of the Marquess of Hastings, 1813-1825", Vol II) in which Prinsep conveys some of the essential features of the nature and extent of control exercised over the Princely States.

It does not appear that the editor has drawn on A U Aitchison's "A Collection of Treaties, Engagements and Sanads Relating to India and Neighbouring Countries" although the book finds a place in the bibliography. The omission is perhaps explained by his objective as mentioned in the Preface, *viz*, to illustrate the different facets of constitutional growth, "as a political scientist would view the problems". But the boundaries that would limit what a political scientist would look for are fast moving outward to cover other aspects of the life of a people. In Part V the editor has included three small extracts dealing with exploitation and un-British rule, one being from the pen of Dadabhai Naoroji. It is indeed time a serious attempt was made to compile first of all a volume of documents on economic-financial matters during two centuries of British rule. Tracing, for example, the stages through which the discussions which ultimately ended with the Sea Customs Act, 1878, would make interesting, if not revealing, reading.

Before ending this review, may we make a small suggestion? In this book the editor has chosen to give the source for each extract at the end of the volume. This is, to say the least, very inconvenient to the reader. In a subsequent edition the reference for each entry may be given on that page itself, abbreviating it if necessary, as has been done quite successfully by Appadorai in his "Documents on Political Thought in Modern India".

## DCM Toyota

DCM TOYOTA has come out with an issue of 15 lakh secured redeemable non-convertible debentures of Rs 100 each aggregating Rs 15 crore. The debentures are being offered on a 'rights' basis to its Indian resident equity shareholders. The issue will close on August 9, 1985. The debentures remaining unsubscribed, if any, will be disposed of on private placement basis at the discretion of the board of directors. The object of the issue is to partly finance the company's Rs 45.8 crore project for the manufacture of light commercial vehicles in technical and financial collaboration with Toyota Motor Corporation, Japan's largest automobile manufacturer. By virtue of the technical assistance agreement, DCM Toyota has the exclusive manufacturing licence in India for the 'DYNA' model, one of Toyota's proven LCVs. The company has set up manufacturing facilities at Surajpur Industrial Area, a backward district in UP. The first LCV 'DYNA', manufactured by the company, rolled out in a record time of 14 months. Given the impeccable parentage of DCM Toyota, there is little doubt that the company shall be the forerunner in the Indian automobile industry. The issue is managed by Grindlays Banks' Merchant Banking Division. J M Financial and Investment Consultancy Services is the advisor and Amritlal Bajaj and Company consultant to the issue.

# Import of Donated Commodities, Export of Feed, and New Technology of Milk Production

**Surendar Singh**
**Kamaljit Singh**

*Operation Flood relies heavily on donated commodities. These donations make India the largest recipient of food aid from the EEC. The inflow of donated commodities is likely to have a contracting effect on the dairy sector of the Indian economy.*

*India, on the other hand, is a major exporter of oilcake meals. A significantly large quantity of it is being exported to the EEC. The domestic supply of this protein meal is otherwise inelastic. This has serious implications for the cross-breeding technology of Operation Flood II, the success of which depends, to a large extent, on the availability of readily digestible sources of energy.*

*The main argument of this paper is that the import of donated commodities and the export of oilcakes are bound to slow down the rate of expansion of the Indian dairy industry and a continuation of such a policy would weaken the position of the Indian farmers* vis-a-vis *the European farmers.*

## I

## Background

THE imported-donated commodities have been assigned an important role in Operation Flood II (OF II). During the programme years (1980-85), a total of 186 thousand tonnes of skimmed milk powder (SMP) and 114 thousand tonnes of butter oil (BO) will be imported from the EEC to supplement the domestic procurement of the Cluster Federations.[1] The funds generated by the imported-donated commodities (Rs 2,352 million) are meant for investment in the dairy industry of India by the Indian Dairy Corporation (IDC). For Operation Flood I also, the World Food Programme channelled 126 thousand tonnes of SMP and 42 thousand tonnes of BO to India, valued at Rs 1,164 million.[2] This makes India by far the largest recipient of EEC food aid, and Operation Flood the biggest dairy development project of the world.

The objectives of OF II are multi-dimensional. One of the objectives is to increase the milk output in the country by introducing cross-bred cattle. The replacement of non-descript milch animals by cross-bred varieties is an essential concomitant of the new technology in milk production because the milk yield rate of the latter is considerably higher. According to the project authorities, the number of cross-bred and upgraded milch animals to be reared by the participating families during the programme period would increase from 1.4 million to 10.2 million.[3]

The introduction of cross-bred cattle, with genetic potential for higher output of milk, will demand extra feed with high digestibility. However, India is an important exporter of protein rich meals of high digestibility. On the other hand, the unloading of donated SMP and BO in the form of reconstituted milk will enhance the market supply of milk. Since this part of the supply is not production-based, it has important implications for the dairy industry of India which have been apparently overlooked. The export of oilcakes and the import of ingredients like SMP and BO are inconsistent with the objectives of the new technology included in OF II. The purpose of this paper is to draw attention to this neglected aspect.

The analysis in sections II and III is concerned with the use-pattern and implications of the donated commodities for the dairy sector and that in sections IV and V with the magnitude and the pattern of export of oilcakes as also with its implications in the light of the new technology. The concluding section is a brief enumeration of the main findings.

## II

## Donated Commodities

The OF II authorities hold the view that a buffer stock of SMP and BO is needed for recombining into liquid milk to overcome any shortfalls in milk production and procurement caused by erratic climatic conditions during the programme period. In the initial years, a large part of the buffer stock is to be maintained with the help of donated SMP and BO but in the final year of OF II it will be made up entirely of indigenously produced commodities. In addition to the buffer pool, a significant proportion of the donated commodities is meant for manufacturing food for infants and also for direct sale.

### USE-PATTERN

The use-pattern of donated commodities is given in Table 1. The data shows that 77.42 per cent of the donated SMP is to be used as buffer pool during OF II. The remaining 22.58 per cent is to be processed for producing food for infants. Of the total imported BO, 21.05 per cent is to be utilised for the buffer pool and 12.28 per cent for manufacturing food for infants. The remaining 66.67 per cent is to be retailed directly as a cooking medium.

There is a slight variation in the use-pattern of imported commodities in the different years of the programme. During 1981-82 and 1982-83, more than 80 per cent of the donated SMP was to be used for the buffer pool. However, during 1983-84, 40 per cent of it was meant for manufacturing food for infants, leaving only 60 per cent for the buffer pool. Similarly, while the proportion of donated BO in the buffer stock was the highest during 1981-82 and 1982-83 (25 per cent in each year), its use for manufacturing food for infants is the highest during 1983-84 (22.22 per cent). The import of donated SMP and BO, according to the project proposal, is to be nil during the final year of the programme.[4]

### BUFFER STOCK *VIS-A-VIS* DONATED COMMODITIES

It is apparent from the use-pattern of the donated commodities that the SMP is primarily meant for building a buffer stock and BO for direct sale. The first question that arises is, why build a buffer stock of SMP? The project authorities envisage that the projected increase in milk output in the OF II areas may not materialise in certain years because of failure of monsoons, floods and such like factors. The provision of a buffer stock will provide a cushion when milk output and prices fluctuate. It is a protective measure aimed at meeting contingencies arising from adverse climatic conditions.

The usefulness of the buffer stock as such cannot be questioned. However, the problems posed by interruptions in milk production are not as alarming as are suggested if we look at the geographical coverage of OF II. The Cluster Federations consist of districts which are dispersed nearly over all the states of the Indian Union.[5] Experience shows that not all the regions suffer losses in milk output at the same time when there are unfavourable climatic conditions. Nevertheless, the project authorities have contemplated the need for buffer stocks even to neutralise localised and temporary shortfalls in milk output. This being so, the main question that arises is whether there is any compatibility between the required level of buffer stocks and the intended imported ingredients.

Table 2 contains data about the projected level of buffer stocks and the magnitude of donated commodities. The projected level of buffer stocks, as in the project proposal, consists of donated as well as home-produced SMP and BO.[6] However, it appears that during the first four years of OF II, the desired level of buffer stocks is to be maintained exclusively with the imported ingredients. The need for indigenous production of SMP for maintaining buffer stocks will thus arise only during 1982-83 and 1983-84. In the case of BO, only one-third of the imports is sufficient for maintaining the stipulated level of buffer stock which clearly indicates that the proposed flow of the donated commodities is considerably higher than the requirements of the buffer stock. It seems that under the pretext of buffer pool much more than what is required is being imported. This is particularly so in the light of the fact that some production of SMP and BO is inevitable in the country during the flush seasons. The main issue here is that the import of SMP and BO is going to influence the supply side in an unpredictable manner which has serious implications for the dairy sector.

Before going into these implications, it is necessary to clear some points. In the first place, it has to be borne in mind that there is no perceptible difference between the imported-donated SMP and BO and the indigenous varieties of these commodities. Together, they constitute a part of the total supply available to the country. The only difference is that the imported-commodities are available to the IDC free of cost and it can use the sale proceeds in whatsoever manner in likes. In the second place, it hardly matters to what use the imported commodities are put; they are a cheaper source of readily available supply at the disposal of the IDC. Thirdly, our own dairy industry is bound to convert a part of the liquid milk into SMP and butter fat in the flush seasons to be used as reconstituted milk in the lean period.

## III

## Implications

Some major implications of import of donated commodities are easy to perceive and are highlighted below.

### PRODUCER'S PRICE

The unloading of imported commodities in the form of liquid milk in the market through Cluster Federations will add to the milk supply in the country. Given the fact that such an increase in supply is not production-based, it would artificially suppress the market price of milk. In case the milk production in the country stagnates for a long time, the import of SMP and BO would become necessary to maintain the required level of supply. This would further suppress the producer's price. Ultimately, a mechanism similar to that of a negative price policy may become operative in the dairy sector.

Lack of price incentives for the producers in a developing dairy sector is likely to result in decreasing the marginal product of factors engaged in production. In such a situation, the factors engaged in the dairy sector would normally shift to other remunerative lines of production. However, in a developing economy like India, such alternatives are not readily available and cannot be created within a reasonable period of time.[7] The persistence of low marginal products in the dairy sector in comparison with the other sectors of the economy, caused by artificially suppressed producer's price, would ultimately lead to a loss in an important line of production. The problem of resource immobility in the dairy sector has been widely noticed even in many a developed country.[8]

One can argue that the quantity of imported commodities is rather limited and imports are confined to OF II years only. At first sight, this appears to be so. However, a careful look into the total volume of imported SMP and BO and its comparison with the buffer stock's milk equivalent makes the position clear (Table 3). If we add the milk equivalent of consumer products to the total liquid milk that is marketed by the Cluster Federations and then deduct the share of the buffer stock, we arrive at the approximate quantity of milk procured each year. Assuming that the entire buffer stock consists of imported SMP and BO, we can work out the share of imported commodities in the total milk procured under OF II.[9] This is shown in the last column of Table 3.
